Grinding Temperature of Woodpulp

Effect of Temperature on Properties on Mechanical Woodpulp—Microscopic Analysis of Results at Various Temperatures—Details of Investigaton

It is almost eighty years since the first American patent was issued on a process of injecting steam into pulpwood grinders for the purpose of loosening up the woody structure and attaining a greater degree of freeness in the wood fiber. (See United States patent No. 239,040.

Attempts were made to obtain the same effects by increasing the pressure surface and decreasing the quantity of spray water. It has also been emphasized by many paper technologists that the wood ground by this process was better suited for manufacture into the paper—that the consummation of power in the grinding process was not so great, writes Dr. Johannes Teicher in Der Papierfabrikant, pages 153-158 and 165-168.

Several Scandinavian mills tried out the process, but they did not find it to be as advantageous as was represented. All sorts of opinions were obtained from manufacturers, some of whom said that the Norwegian pulp wood was particularly well suited for being worked up into pulp by the hot grinding process, that the fibers of the pulp were longer and tougher than those obtained by the cold grinding process, that the latter yielded a larger percentage of coarse stock than the hot process and that the grinding was carried out to better advantage, the higher the temperature. Certain Finnish mills also reported themselves to be well-pleased with this process. A German mill advised that the wood pulp obtained by the hot grinding process possessed a high degree of felting; a paper board mill said that it was able to manufacture a high grade of paperboard from hot ground wood pulp and that it could finish the board in greater thicknesses than when the cold grinding process was used. Various other favorable reports have been obtained from other paper mills both in Europe and in America.

The general concensus of opinion is, therefore, that the hot grinding process is decidedly advantgeous. Nevertheless, as the majority of paper mills manufacturing mechanical wood pulp were driven with water and consequently the power consumed in the grinding operation varied with the ever-changing level of the water in the grinder, it was not possible to determine the conditions under which the process operated with any degree of certainty. This referred particularly to the temperature at which the grinding was carried out.

Distribution of Heat and Work in the Grinder

A large part of the mechanical energy consumed in the grinding of wood is converted into heat by friction and a relatively small portion is actually utilized in the production of mechanical pulp. It has been calculated that approximately 50 to 51 percent of the total power consumed in the grinding operation is converted into heat. It was natural that efforts should have been made to utilize this energy, which is lost in the form of heat, in some useful manner.

The heat that is evolved during the process of grinding, due to the friction between the blocks of wood and the grinding stones, is transferred to the spray water used in wetting down the wood. When the amount of spray water added is kept constant the temperature developed in the grinder is proportional to the energy consumed in the grinding opera-

NOV 14 1924

559654

tion or, vice versa, the temperature of the spray water is dependent on the quantity of water used when the energy consumed is maintained constant.

In the case of air-dried wood water is present in invisible form within the wood itself. A part of this water is evaporated by the rise in the temperature of the spray water and this results in the wood splitting open. In this manner a part of the mechanical energy which is converted into heat is utilized directly in splitting open the wood. This partly explains the fact that when wood is ground by the hot or warm process a considerably smaller proportion of stock requiring refining is produced, so that in mills where this process is used it is possible to get along with a much smaller number of refining engines than when the cold process is employed. It has also appeared to be most advantageous to return the waste water to the stones by the shortest path so as to avoid any unnecessary loss in heat, in power.

As in the manufacture of papers containing larger amounts of wood pulp the beater serves mainly to beat up the fibers, the grinder has to solve problems which belong to the beater in the manufacture of fine papers. A certain degree of freeness must be obtained at the grinder so as to furnish a stock which yields a well-made, strong paper. This condition is partly attained by the evaporation of the absorbed water. This fact is substantiated by the tests that were made by the author.

Experimental Details

In order to determine the properties of mechanical wood pulp made at different temperatures and to study them more closely experimental grindings were made. In these experiments great care was taken to see that all the other factors which have an effect on the quality of the mechanical wood pulp were maintained constant. Only the grinding temperature was allowed to vary and this was controlled by the amount of spray water employed. In this way only the one factor, variation in temperature, was examined as to its effect on the properties of the product.

For this purpose a high powered Voith grinder was employed. The stone had a diameter of 1370 millimeters and a width of 1200 millimeters. The pressure in the presses was obtained by hydraulic means. At a speed of 345 revolutions per minute the circumferential velocity was 24.7 meters per second.

During the removal of samples of the stock the grinders worked on all three cylinders. The hydraulic pressure on the press cylinders amounted to 2.3 atmospheres. As the hydraulic pressure does not yield any information regarding the magnitude of the specific pressure without going through a calculation, the total pressure on the piston of the hydraulic cylinder was determined from the pressure—measured in atmospheres—that the water exerted when this total pressure in kilograms was divided by the area of the grinding press surface in square centimeters. The diameter of the piston of the hydraulic cylinder was 400 millimeters; the area of the pressure piston surface was accordingly 1256 square centimeters. As the pressure in the pressure cylinder was 2.3 atmospheres, the total pressure exerted on the piston of the pressure cylinder was 2888 kilograms.

The surfaces at which the pressure was applied to the wood were one meter broad and 563 millimeters high; hence, they possessed an area of 5630 square millimeters in each press cylinder.

In carrying out the calculation of the pressure it must be remembered that there must be taken into consideration the fact that the actual pressure surface, that is the surface of the compressed wood, is smaller than that calculated, for the reason that there is a certain amount of clearance between the pieces of wood and the grinding surfaces. It is accordingly customary to take two thirds of the total press surface as the proper figure when working with round logs of small diameters and split pieces, and three quarters of the calculated area when working with round wood of greater diameter.

As the wood that was used in the experimental grinding tests was cut from large picked round logs, three quarters of the total grinding press surface was used in the calculations and for this reason each press was assumed to have an effective pressure surface area of 4223 square centimeters.

As indicated above, the total pressure on the total grinding surface was 2888 kilograms. It follows then that the pressure per square centimeter of the press grinding surface was 684 kilograms. The power used in the grinding amounted to 550 horsepower. The grinding stone was manufactured artificially and it was previously sharpened by two hours' grinding. The angle made by the stone and the longitudinal axis through the wood fiber was an acute angle, as is the practice in wood grinding today. The wood used for grinding was choice, dry round pine logs, which had been machine barked, but in which the knots had not been bored out.

Conditions in the Operation of the Grinder

During the operation of the grinder it was customary to allow the apparatus to grind at a temperature of from 40 to 50 degrees C. In order to conduct the grinding at a lower temperature the grinding was started Monday morning, as by standing idle over Sunday the grinder had assumed the temperature of the room in which it was located. The room temperature during the grinding was about 12 degrees C and the temperature of the spray water about 10 degrees C.

During the grinding experiments great care was taken to see that both the pressure in the presses and the speed of the grinding stones were maintained constant at all times. Inasmuch as the entire experimental grinding test required only from one to one and one half hours for completion it was unnecessary to take into consideration the dulling of the stones brought about by the grinding itself. In this manner it was established that the difference in temperature which was brought about by the reduction in the quantity of water sprayed on the stones was the only factor influencing the grinding process.

As has been mentioned heretofore the temperature of the spray water, and accordingly the temperature of the grinding process at the start was 10 degrees C. Soon after the grinding process had progressed to some degree, the temperature rose to 18 degrees C. All these temperatures were measured in the body of the water. At a temperature of 35 to 40 degrees the stock began to steam. The typical grinding odor that is prevalent around grinding machines became more distinct until a temperature of 64 degrees C was reached, at which point a thick mass of ground wood, strongly steaming, was obtained.

The samples of mechanical ground wood which were used for further testing were taken from the mass of wood and water in the trough of the grinding machine while the temperature was maintained constant and they were placed in bottles and conserved for future use. In this way the decomposition which air induces in samples of mechanical pulp under these conditions was avoided.

Measurement of Spray Water

It did not seem advisable to take samples from the material in board form as in that condition the pulp has already passed through the screening devices and the refining engines, which might have some effect on its properties. The dehydrating machines as well may have some influence on the stock. Furthermore, it was found to be impossible to take samples of the stock in this form and still maintain the prevailing temperature at a constant point. Then, again, the paper stock in board form did not appear to be suitable for further investigation, for the reason that the board had to be broken up again in the laboratory and this process influenced both the degree of the beating to which the paper stock had been subjected as well as its other properties. This, needless to say, led to all sorts of errors in the results and incorrect conclusions drawn from them.

It was unfortunately impossible to measure the quantity of spray water which was used in the experiments. However, in order to arrive at some idea as to how the temperature was caused to rise in a numerical relation by a reduction in the amount of spray water fed to the grinders, the stock was scooped out of the grinder pit into which the ground stock and water flowed. These samples were tested to determine the proportion of water present therein, which gave the experimenter some conception of how much water was being used.

The determination of the dry weight of paper stock in these samples, which was carried out in the testing laboratory, indicated the dilution of the stock at any point during the grinding text. These determinations were carried out in such a manner that at first the greatest part of the water was removed in a drying oven and then the last traces of moisture in the pulp removed by means of an air pump in the usual manner. The following table shows the averages of various tests made in this manner.

Grinding temperature in degrees C.	Concentration of the stock in %	Ratio of dilution. stock to water.
18	0.87	1 : 115
25	1.56	1 : 64
33	2.40	1 : 42
40	2.89	1 : 34.6
46	3.63	1 : 27.6
57	4.58	1 : 21.8
60	4.90	1 : 20.4
64	5.20	1 : 19.2

If the temperatures are plotted as abscissae and the dilution ratios, stock to water, as ordinates, then the curve shown in Figure 1, is obtained.

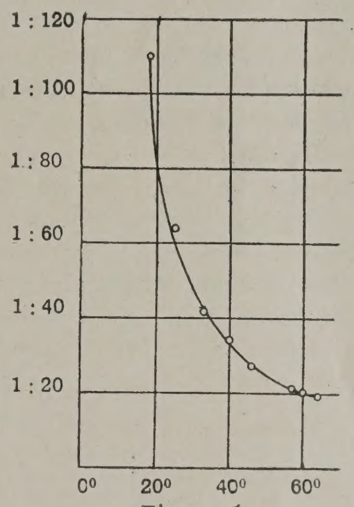

Figure 1.

From the dilution ratio 1 to infinity at a temperature of 10 degrees C the curve declines steeply and reaches the dilution ratio of 1 to 100 at a temperature of 19 degrees C. It changes its direction to the horizontal, slowly at first and then more rapidly and reaches a dilution ratio of one to 19 at a temperature of approximately 64 degrees C.

Grinding Test Carried out in Cold Weather

The grinding test was started on a day that was extraordinarily cold, so that the spray water had a temperature of only 10 degrees C. It is ordinarily customary to use over again as spray water the heated waste water from the dehydration machine, the heat in which is derived from the grinding of wood in a previous operation. The result is that the temperature of this water is between 30 and 40 degrees C. However, in order to investigate the effect of lower temperatures, the experiments were also carried out with fresh spray water. It is natural to expect other degrees of dilution when using spray water whose temperature is higher than usual. The results which are given in the following also include the dilution ratios which correspond to the different temperatures at which the grinding tests were carried out.

Microscopic Investigation

The microscopic investigation of the fibers shows just what condition the fibers are in when the structure of the fibers and their properties are known and used in conjunction with the observations that are made and the photographs that are taken.

Examination of the stock under the microscope reveals the length and thickness of the particles of wood. It will afford information regarding the character of the ends of the wooden particles and will also reveal whether the individual particles are uniform. It will show if these occur as isolated particles and solid tubular membranes of woody cells or as strips of tubular membrane cut in the longitudinal direction or if they are just squeezed. These particles of wood may also be cut up into unrecognizable fragments or the fibers may appear as fragments of a texture made up of many woody cells cut up into pieces.

It is, however, impossible to classify the stock in accordance with its appearance under the microscope, as an individual sample of stock may consist of larger or smaller proportions of the different kinds of fiber structures just described.

The different grades of wood pulp obtained in the foregoing experiments by variation of the temperature of grinding were examined under the microscope and it was found, as might be expected, that the appearance of the various wood pulps varies considerably with the treatment to which the wood was subjected during the grinding process. Each grade of mechanical wood pulp possesses a characteristic microphotograph.

Details of Microscopic Examination

In examining the different samples under the microscope a magnification of 65 diameters was employed. It was found that when a greater magnification was used it was not so easy to obtain a clear image of the fiber sample so that both the total length of the fibers and the general appearance of the same could be observed accurately. It was also inadvisable to use a lesser magnification, as when this is done, it is not possible to distinguish the internal structure of the woody cells.

It was found to be a simple matter to distinguish between the thick-walled and thin-walled cellular fibers when the 65 power microscope was employed. The woody cells were seen to be covered with the characteristic spots exhibited by pine wood fibers, which appeared mostly as double concentric circles under the microscope. It is also possible to distinguish accurately the medullary ray cells which run from the middle of the stem outward in a star-shaped arrangement. These cells are characterized by their lattice-like structure.

A Nernst lamp was employed as the source of light in making the microscope examination. The light from this lamp was first passed through a liquid light filter. The filter was arranged in the form of a small bulb about 3 centimeters thick between the microscope and the lamp. The liquid employed in the filter was ammoniacal copper oxide and consisted of 200 cubic centimeters of distilled water, one hundred cubic centimeters of ammonia and 15 grams of copper sulphate. Orthochromatic photographic plates were used in taking the pictures. The time of exposure varied from approximately twenty to thirty seconds.

Examination of the Micro-Photographs

There are three distinct phases to be considered in the examination of the photographs. The mechanical wood pulp that was ground in the cold, at temperatures varying from 18 to 33 degrees C, showed a distinctly open structure. It is very easy to distinguish splinters, double and triple fibers, pieces of woody texture and woody cells clinging together in a mass. The fibers appear to possess little felting power, as they are a little bent and appear to be rather stiff.

The mechanical wood pulp which was ground at an elevated temperature, that is at temperatures which varied from 33 to 46 degrees C, showed many average length bundles of fibers, fewer splinters and also possessed well isolated, long and average length fibers. These appears to be wound up into coils and hence seemed to be better able to felt together than the fibers of the cold ground mechanical wood pulp. Furthermore, there is a certain freeness in the fibers which is very advantageous for the luting or cementing together of the felted fibers.

The mechanical wood pulp which was ground in the hot conditions, at temperatures varying between 57 and 64 degrees C, showed almost no woody cells cemented together in a mass. The pulp also possessed a greater degree of freeness. The photo-micrograph showed a conglomeration of fibrilles intertwined with one another and held together by a mass of hydrated material. This kind of wood pulp sometimes exhibits the fineness of chemical pulp and appeared to be very well disintegrated into fibers.

It was interesting to note the exact characteristics of woodpulps ground at different temperatures as they appeared under the microscope. In the first case the sample of wood ground at a temperature of 18 degrees C looked like splintered wood. The woody cells, combined in masses, were scattered through the microphotograph in every direction but were not wound up in coils. The ends of the fibers were broken off short or splintered off.

The sample of woodpulp ground at a temperature of 25 degrees C appeared to have more texture than the one just described. It also had more of a tendency to felt. However, scattered through it was quite a quantity of bundles of fibers, splinters, double and triple fibers and fiber ends broken off short. It was also possible to distinguish the lattice-like structure of medullary cells.

The sample ground at a temperature of 33 degrees C was somewhat denser but, on the other hand, possessed a splintery character and showed a quantity of woody cells which had been destroyed by the grinding of the wood. Nevertheless the felting power of the fibers seemed to be greater and isolated woody fibers were distinguished.

In the sample ground at a temperature of 40 degrees C it was easy to distinguish individual fibers, which appeared to be longer. The fiber ends were wound up more and easily twisted into a compact mass. They also appeared to be well suited for admixture with the main body of the stock.

The pulp ground at a temperature of 46 degrees C was composed of long fibers and contained much fewer splintered ends. It contained many isolated fibers, although there was still a certain proportion of double and triple fibers in the mixture. There was a certain amount of hydration in the sample and this served to hold together the felted fibers in a compact mass.

The pulp ground at a temperature of 57 degrees C possessed a distinct chemical pulp appearance. The fibers were twisted up into coils scattered throughout the mass in every direction. This condition makes for good felting quality. The fiber also seemed to have been hydrated in part, which means that there is more cohesion between the individual fibers and also means that a better grade of paper can be manufactured from such pulp.

The hot mechanical woodpulp ground at a temperature of 60 degrees C contained many isolated fibers in a similar manner, mixed with intertwined fiber ends, as well as with many agglomerations of fibrilles. It also contained considerable hydrated material which had partly given up its fibrous nature and had a cloudy appearance.

Finally, the number of long fibers in the mechanical wood pulp manufactured at a temperature of 64 degrees C was somewhat less than in the 60 degree pulp but, on the other hand, the fineness of the pulp was considerably greater. This condition may possibly be brought about by the fact that the small amount of spray water added to the grinder during the manufacture of the pulp had no longer the power of washing the stone clean and the grinder therefore performed part of the work of the refining engine. Otherwise the appearance of this pulp was much the same as that of the 60 degree pulp. The mass of pulp was full of interviewed agglomerations of fibrilles, a cloudy mass of hydrated matter and a number, of strands of individual fibers. The entire mass of fibers and hydrated matter, which was almost colloidal in character, was compact and firmly knit together so that a well-formed, homogenous sheet of paper was obtainable from the pulp.

(To Be Continued.)

Fall Business Conference

Successful Meeting in Chicago of American Paper and Pulp Association and National Paper Trade Association—Forestry a Prominent Feature

THE expression of universal belief that basic conditions seem to favor increased prosperity in all industries, plans to put into effect helpful principles of the standardization and simplification of paper sizes and weights, and a study of forest fire prevention were the outstanding developments of the convention of the American Paper & Pulp association and the National Paper Trade association, held in Chicago October 8th to 11th.

All branches of the conference declared faith in the belief that the paper industry is approaching the fall months with confidence, anticipating continued business gains with no serious handicap to overcome in getting away to a good start.

Address of President Stokes

Encouraging views regarding the paper trade outlook were stressed by Henry W. Stokes, of the York Haven Paper Company, Philadelphia, President of the American Paper and Pulp association, to members of the two associations assembled in joint convention. Mr. Stokes submitted his statement as expressing the views of manufacturers on general business conditions. Similar views of a continued prosperity were expressed by J. A. Carpenter, of the Kansas City Paper House, Kansas City, vice president of the merchant's organization, and Walter J. Raybold of the B. D. Rising Paper company, Housatonic, Mass., former president of the producers' association.

The joint session was the closing business meeting of "Paper Week, and delegates representing all branches of the industry were in attendance when President Stokes called the gathering to order.

In addition to the discussion and reports on general conditions, W. A. Durgin, chief of the Division of Simplified Practice, Department of Commerce, told of the work being accomplished in the matter of standardization. A resolution was adopted endorsing the principles of standardization and simplification of paper sizes and weights as exemplified in reports of committees made to the General Conference in Washington last June. It also was the sense of the resolution that the two associations stand ready to cooperate with the users of paper in making the specific recommendations of the general conference effective.

The statement submitted by President Stokes follows in substance:

"In general, basis conditions seem to favor an upturn of all industries. Transportation problems are being met successfully, labor conditions are stable with increasing rather than decreasing wages, and foreign complications, if not favoring a better development of trade, are certainly not such as to warrant undue anxiety.

"The transportation situation should not be ignored by the student of business conditions. The more rapid handling of freight by the railroads has a direct bearing upon business conditions. The fact that there is now a shorter time in transit for raw materials, and between the manufacturer of the finished product and the consumer, is a factor to be carefully weighed when considering stocks on hand either of raw materials in the mills, or of finished products in the hands of the distributors.

"The general labor situation is satisfactory, with no surplus of workers, and at the same time enough of a labor supply to eliminate any immediate danger of such a labor shortage as would force existing high prices for manufactured goods to abnormally high levels.

"Some students of fundamental economics are coming to the belief that too much stress has been laid upon the possible effects of Europe's political troubles upon American industry. It is their further contention that conditions abroad are such that America's high cost of production, due largely to the high standard of wages paid in this country, can hardly enable the American manufacturer to sell abroad at a profit. With the stabilizing of Europe there may be low cost production abroad, due to the readiness of European labor to work for wages that an American workman would not accept, and an amount of production that would not require America's manufactures. Such stabilization, however, should give a buying power for American agricultural products but would increase the buying power of the American farmer.

"In any event it would appear that the future prosperity of American industry will be increasingly dependent chiefly on domestic, rather than foreign conditions.

"It should be noted that for the first time since March prices of general commodities are showing an upturn. Special significance should be attached to the gain in relative value of agricultural products, and the resultant accentuated buying power of the middle west and south."

Forest fire prevention as the primary objective of the Woodlands departments of the paper companies of this country, was urged by O. M. Porter of New York City, secretary of the Woodlands section of the American Paper and Pulp association Tuesday at the opening session of the fifth annual business conference of that organization. Mr. Porter said that probably the largest single problem confronting the paper industry is adequate supplies of pulp wood, a problem which in a large measure, according to his belief, may be solved by fire protection.

Necessity for Forestry Recognized

C. W. Hurtubis of the Hammermill Paper Company, Erie, Pa., chairman of the Woodlands section, called that gathering to order and presided. He said that notwithstanding the organization is but three years old it was his opinion that much of great importance to the industry has been accomplished. It was apparent that all in attendance at the meeting realized that the proposed Canadian pulpwood embargo will have the effect of forcing an appreciation upon this country of what must be done in the matter of intensive forestry.

Secretary Porter submitted a report in which he outlined the work to be accomplished. He said that the Woodlands section has been able to complete the survey of the pulpwood supplies of the United States, and told of an investigation concerning pulpwood decay and its effect on pulpwood production that is now being carried on by the United States Forest Products Laboratory in co-operation with the Newsprint Service Bureau and the Woodlands section of the Canadian Pulp and Paper association. Mr. Porter offered the suggestion that for the balance of the fiscal year, the Woodlands section devote its funds and activities to the further development of the reforestation data of the association.

Raphael Zon of the United States Forest Service told the delegates much of interest. Dr. Zon is in charge of the Lake States forest experiment station. He told of the work that is now being done in the Northern producing regions. John E. Alexander of the Nekoosa-Edwards Paper company, Port Edwards, Wis., told of results of experiments in the manufacture of pulp from inferior wood. The Woodlands session closed following motion pictures demonstrating the use of a machine in snow hauling of pulpwood. One picture taken at the camps of the C. C. Collins Lumber Company, at Long Lake, Wis. showed the machine hauling 84 tons of wood. This is an entirely new method of applying the automotive principle to a machine for Winter hauling.

Considerable interest was displayed by the wrapping paper group in the address given Wednesday by John R. Mauff, executive vice president of the new organized Paper Industries Exchange. Mr. Mauff explained in detail the exchange system of trading and price determination. He said that the success of the new exchange is now assured and told of the plans for the opening of the New York branch of the organization on October 16, in the Pershing Square building. The opening of this New York exchange is the acid test of the success of the new organization attained in less than two months of trading, Mr. Mauff declared. Numerous delegates visited the board rooms of the Paper Industries Exchange during their visit here.

The conference was the most largely attended of any meeting in the history of the paper industry. It was not only a gathering of producers, foresters, and others interested in the manufacture of paper and paper products, but also a gathering of those engaged in the merchandising branch of the industry.

Business Conditions Are Sound

"The paper industry has little to fear from the future, for the basic conditions of the country are sound," says the October market review of the Paper and Pulp Industry, the monthly bulletin of the American Paper and Pulp association. "In the paper industry itself there is a general sentiment of conservative optimism.

"In the fine paper field, the costs are as high as they have been, stocks at the mills are normal, while those in the hands of merchants and printers are below normal. The market is very firm for higher grades of paper, and the demand is fast returning. In this field, the manufacturers anticipate very good business all this fall, and well into if not all through the year.

"Book paper production for August showed a 20 percent increase over July, and shipments were 18 percent above those of July. Canadian coated paper quotations have gone up a half cent, based somewhat on the high prices for casein, but the casein situation at present is much more favorable than in the early part of the year. Coated paper consumption suffered somewhat from enforced changes to super-paper by big consumers, owing to the increased cost of marking casein coated paper. With Argentine casein again in the market, even though at high prices owing to the unwarranted duty, the situation is somewhat less difficult than earlier in the year.

"The wrapping paper situation will certainly be quick to show a response to an improvement in business, as in many ways the wrapping paper field is more responsive than other grades to changes in business. When the housewife is a free buyer of food stuffs, the wrapping paper demand immediately mirrors this improved situation.

"The improvement in the paper board group is also indicative of an improvement in public commodity buying, and the wrapping and bag groups should not be far behind the 25 per cent increase in board production recorded for August as compared with July.

"Specialties, such as waxed, vegetable parchment, and other food protective papers, as well as the glazed and fancy papers used by the box manufacturers are already showing improvement.

"The New York newspaper pressmen's strike will not be a long time factor in the newsprint situation. Some of those close to the situation expect an increase of 10 percent in newsprint consumption the coming year, over 1923."

New York Paper Exchange Opens

IF the interest manifested in its opening is any criterion, the Paper Industries Exchange promises to become a huge success in New York. Not in a long time has any event in the paper and stock trade aroused such enthusiasm or attracted such a large crowd as the opening of the New York branch of the exchange Tuesday, October 16, in the Pershing Square building, 100 East Forty-second street. More than a hundred paper and board mill representatives, box dealers, waste paper packers and brokers, wood pulp importers and others interested in the exchange were on hand to witness the start of trading in box board and the raw materials consumed by paper board mills on an exchange basis.

The large room on the eight floor of the building engaged for the exchange quarters was scarcely large enough to accommodate the crowd. All the chairs provided for the traders were filled long before the noon hour, which was the time fixed for opening the exchange, and by the time the session was under way there was a large gathering that for every one fortunate enough to occupy a chair two or three were standing around the room watching the proceedings.

Just prior to the start of trading John R. Mauff, executive vice president of the exchange, explained the system of trading, and also announced that at a board of directors meeting earlier in the day classifications of waste paper as recommended by the paper stock group of the board had been adopted, these classifications to apply to all waste paper sold on the exchange.

Mr. Mauff wielded the gavel during the trading which followed and called out the bids, offers and sales. As each bid or offer or sale was made it was marked up on a large blackboard which extended nearly the length of one side of the room by A. J. Neumann, assistant to Mr. Mauff, who is to be manager of the New York exchange. Mr. Neumann was for three years secretary and treasurer of the Container Club, an organization of paper box manufacturing with headquarters in Chicago, and is thoroughly familiar with paper and board as well as the exchange system of trading.

Trading on the exchange lasted for one hour, from 12 o'clock noon until 1 p. m., this hour being chosen to conform with the hour between 11 a. m. and noon during which trading is conducted on the exchange in Chicago. It is planned to have a record of the bids, offers and sales telegraphed every day between the two exchange branches so that traders in New York may offer or accept merchandise on the Chicago exchange, and vice versa.

Initial Trading in Waste Paper

Probably the most noticeable feature of the opening season on the New York exchange was the large tonnage of waste paper offered. New York dealers and packers of old paper were extended a cordial invitation to attend the opening whether members or not and they responded almost a hundred per cent, and were not the least backward in making offers of waste paper. In fact, in view of the large and representative gathering of mill men and paper stock packers and the amounts of stock offered, the tonnage of old paper sold at the initial session was rather small. A total of 15 sales was made, involving some 1,300 tons of waste paper.

The prices realized on waste paper disclosed no surprises. Most of the stock sold was of western origin and sold by western packers, and the prices figuring were in line with those recently prevailing on the exchange in Chicago. Three lots of stock were sold by New York packers, and the prices secured were if anything, slightly under the levels ruling in the open market in this city.

No sales of paper board, wood pulp, felts, machines wires or other affiliated products which will be dealt in on the exchange were effected during the first day's session. There were some offerings of board, and one bid for sulphite pulp, but the prices apparently were not attractive enough to lure buyers or sellers, as the case may have been.

Following the close of trading at 1 p. m., George A. Gair, president of the exchange and also president of the Robert Gair Company, board manufacturers and producers of paper boxes and shipping containers, addressed the gathering, and outlined briefly the purposes of the exchange and extended an invitation to all present to become members of the exchange, pointing out the advantages to be gained by membership in the trading body.

Sales of waste paper on the opening day on the exchange were as follows: 100 tons of No. 1 mixed paper at $21.50 per ton f. o. b. Chicago, 100 tons of No. 1 mixed peper at $21 per ton f. o. b. Cleveland, 100 tons of No. 1 mixed paper at $24.50 per ton f. o. b. Grand Rapids, 100 tons of No 1 mixed paper at $21.50 per ton delivered Chicago, 100 tons of No. 1 mixed paper at $21.50 per ton f. o. b. Chicago, five carloads of No. 1 print manilas at $32 per ton f. o. b. Chicago, 75 tons of No. 1 print manila at $32 per ton f. o. b. Chicago, 50 tons of No. 2 news at $22.50 per ton delivered Chicago, 100 tons of No. 2 news at $18 per ton f. o. b. New York, 100 tons of No. 1 news at $23 per ton f. o. b. New York, 100 tons of No. 2 mixed paper at $16.50 per ton f. o. b. Boston, 100 tons of No. 1 mixed paper at $22.50 per ton f. o. b. Red Bank, O., 50 tons of No. 1 craft paper at $43 per ton f. o. b. New York, 100 tons of No. 2 news at $17.50 per ton f. o. b. Whippany, N. J., and 100 tons of No. 1 news at $22 per ton f. o b. Boston.

Offerings of box board were as follows: 100 tons of A-B plain chip at $60 per ton delivered sidewalk New York, 100 tons of A-B plain chip at $50 per ton f. o. b. Alton, Ill.; 100 tons of straw board at $40 per ton f. o. b. Lafayette, Ind.; 100 tons of chip board at $60 per ton f. o. b. Boston, 100 tons of chip at $60 per ton f. o. b. New York, 100 tons of chip at $55 per ton f. o. b. Philadelphia, 100 tons of new board at $60 per ton f. o. b. New York, 100 tons of news board at $60 per ton f. o. b. Boston, and 50 tons of chip at $54.50 per ton f. o. b. Philadelphia.

May Lose Paper Plant

The Oregon City Manufacturing company objected to the vacating of Third street, which is used for the parking of the automobiles of its employes. Following this, W. P. Hawley, president of the Hawley Pulp and Paper company, located at Oregon City, has issued a statement declaring that because of the objection to vacating Third street his company has entirely given up all plans to build the new $1,200,000 addition to its plant at Oregon City.

The company has rearranged its plans but he does not state whether it will build a paper plant elsewhere or not.

Oregon City people hope that some agreement can yet be made so that the new addition will be built in their city. When completed it would have furnished employment to 250 men.

Edward P. Gleason, chief engineer, and John E. Alexander, chemical engineer of the Nekoosa Edwards Paper company of Port Edwards, Wisconsin, have left for a month's trip in the interests of their company. They will visit a good many of the larger mills in the East and in Canada, and also some paper and pulp machinery manufacturers. Mrs. Gleason and Mrs. Alexander accompanied their husbands on the trip.

Wisconsin Men on Forest Policy Advisory Committee

Research Work in Madison Has Important Bearing on Industry

Out of twenty leaders in the American pulp and paper industry asked by Secretary Wallace to function as an advisory committee in forestry policies, three men are from Wisconsin.

They are: L. M. Alexander, president of the Nekoosa-Edwards Paper company, Port Edwards; D. C. Everest, vice president of the Marathon Paper Mills company, Rothchild, and O. Bache-Wiig, vice president of the Wausau Sulphite Fiber company, Mosinee. Hugh P. Baker, secretary of the American Pulp and Paper association, was active in the formation of the committee and conferred upon it with Chief Forester Greeley and E. H. Clapp, director of research for the forest service.

"The members of the committee, and through them the entire pulp and paper industry, should become more directly concerned in the development of forestry policies and in the conduct of our research work, whether that of the forest products laboratory, of the forest experiment stations, or along economic lines," said Secretary Wallace.

"Furthermore, I believe that in the long run such a committee ought to help materially in the department's relationship with the public in all matters concerning forestry practices and the utilization of timber and its products. In short, through the appointment of such an advisory committee I can see a splendid opportunity for an increasingly effective contact and cooperation."

Research in pulp and paper making for the forest service is being conducted in the forest products laboratory in Madison and its progress is closely watched by manufacturers.

One experiment, now going forward, to determine how useful decayed wood may be in the manufacture of pulp, is in part financed by the American Pulp and Paper association.

Forest research in the growing of timber crops now under way at various forest experiment stations, and the development of federal and state policies for the production of timber upon the country's forest lands, are other activities with which the department is closely concerned.

Joint Meeting at Appleton

Appleton, Wis., is preparing to entertain the joint meeting of the Technical association, the northwest division of the Accountants' association and the northwest division of the Superintendents' association, all branches of the American Pulp and Paper association, which will be in session Oct. 26 and 27.

It is expected to be the largest gathering of paper mill men ever held in Appleton. Delegates from all the paper mill cities in the central west will be represented.

The convention will be opened by an address of welcome by Mayor Henry Reuter and responses by officials of three associations.

Some of the greatest paper mill authorities of the country are scheduled to make an address. There will also be talks by authorities on industrial subjects such as that of George P. Hambrecht, former chairman of the Wisconsin Industrial commission. Among the other speakers are Prof. White of the University of Michigan; Lyman Beeman of the Consolidated Waterpower and Paper company; K. T. King of the du Pont company and others.

The three associations will meet for a joint session at a banquet on the closing night of the convention. Officers will be selected by the superintendents and the cost accountants at business sessions on Friday and Saturday.

The delegates will visit the large paper mills at Kimberly on Saturday and at noon will be guests of the Kimberly-Clark company at luncheon in the company's new community hall. The delegates will return to Appleton immediately after the luncheon to resume their sessions. The technical association will formerly open its convention with a business session Friday at 9 a. m. There will be a dinner for the technical men at 7 a. m. Friday at the Conway house when the testing committee will present its report. This will be followed by a discussion.

A number of papers will be read before the meeting of superintendents, among the following:

"Colors," by K. T. King of th duPont company.

"Wires," by G. E. Buchanan of the Appleton Wire Works.

"Sulphite," by some one yet to be determined.

Officers of the Superintendents' association are to be elected at a business session at 7 p. m. Friday. After the visit to the Kimberly mills and the luncheon Saturday noon the superintendents will meet in Eagle hall and the following papers will be read:

"Heat Losses," by E. P. Gleason of the Nekoosa-Edwards Paper company.

"Oiling," by C. H. Brownley of the Appleton Woolen Mills. Waterpower and Paper company.

"Groundwood," by Lyman Beeman of the Consolidated

The superintendents will end their convention at the joint banquet in the evening.

Fire in Wisconsin Mill

Fire that was caused by the use of an acetylene torch caused damage in the wood room of the Riverside Fibre and Paper company at Appleton, Wis., to an extent of several hundred dollars.

The floor of the woodroom was considerably burned, as was also the wood work such as timbers, beams and posts supporting platforms. The blaze was confined entirely to the first floor, however.

The woodroom was not in operation at the time of the fire, but repair work had been going on and it is believed that sparks from the acetylene torch ignited some of the sawdust on the floor. The fire had to be extinguished with water as the distance was too great to be reached with the chemical hose.

Gift to B. T. McBain

Soon after B. T. McBain's return from the Michigan Division meeting of the Superintendents association of the American Pulp and Paper Industry at Kalamazoo he was presented by the Michigan division with a large desk pad and file with the following inscription:

B. T. McBain

"KING ON WASTE"

Mr. McBain's paper aroused considerable discussion at the Kalamazoo meeting. He is assistant general manager of the Nekoosa Edwards Paper company with mills at Port Edwards and Nekoosa, Wisconsin.

Fox River Mills Keep Up Production

Paper mills of the Fox river valley in Wisconsin are emerging from the usually dull period of the summer months without having had to close down or being forced at any time to materially reduce their number of employees, a survey shows.

Although the mills in this section have been handicapped to some extent by the necessity of using auxiliary steam power because of low water, permitting during the last sixty days only a 30 per cent normal draw, the outlook for the future is considered extremely bright.

For the first time in recent years the shipment of pulpwood to mills of the Fox river valley has continued interruptedly throughout the summer.

Why Have "Cycles" in Business?

By B. T. McBain *Assistant General Manager, Nekoosa-Edwards Paper Co.*

A RECENT report of the press says our friend Babson means to continue his tactics until business men are all honest, or words to that effect. Our firm subscribes for Babson's reports and I always read them with interest. We also subscribe to the work of the Wrapping Paper division of the American Paper and Pulp association and the meetings are always attended by a representative of our company.

But, while all this data and these reports are of value in many ways and interesting, I believe we are all influenced by them entirely too much and that the buyers of the country are watching what Babson has to say to the point that when he says "Two months hence there is to be a slack period" they quit buying at about that time to be on the safe side with the result that the prediction comes true. It cannot be otherwise.

There is no more reason for cycles in business, in my opinion, than there is that we should have to starve ourselves one day, week or month, and then gorge ourselves the next period. It is true that we have had these cycles in the past; but I cannot see that Babson's work is doing anything to correct this condition. In fact, it is having the opposite effect; it is almost making these cycles positive at certain intervals and the longer business men generally continue to be governed entirely by the reports sent out by Mr. Babson and other like agencies, the surer we are to have these ups and downs.

We are seemingly more and more depending upon the fortune teller in business and when this happens, failure results. As I look upon the condition today, business is good. We are running full 200 tons per day and selling all we are making. If you make it good enough, no matter what your product, there is usually a demand.

The longer business men play this "Monkey see, Monkey do" game with Babson and others, the longer will they have these regular ups and downs in business, which they please to term cycles.

No Rise in Newsprint Price

No upward revision in newsprint prices for the first half of 1924 is expected now as the result of recent letting of contracts by some of the smaller companies at $75 a ton, or 3¾ cents a pound, the price that has held all through this year as against $70 in 1922 and the peak price of $130 reached two years ago.

The International Paper Company, which generally sets American print prices, has taken no formal action yet, but it was reported in the New York financial district that Canadian companies were planning on keeping the present rate in force, and American companies are not expected to do otherwise.

Chemical Equipment Exposition

The Chemical Equipment association's annual meeting was held at the Chemists' club, New York, September 20 at 2:30 P. M., President Schenck in the chair.

The work of the association in the ten months since it began active operations with a central executive office and a secretary was reviewed by President Schenck. Recommendations for the broadening of this work along lines of general service, advertising to equipment using fields and interchange of information among members were made.

The association by unanimous vote of the members present instructed the new president to appoint a committee to formulate plans for an exposition of chemical equipment. This action followed a general discussion of the relation of expositions in general to the chemical industries in their present stage of development.

It was very plainly the sense of the association that, valuable although the presentation to the general public or to selected sections of it of the development of chemical manufactures may be, the interests of producers of equipment and supplies for the chemical industries and current conditions inherent in those industries, point to the advisability of a selling exposition also.

Officers and directors for the ensuing year were elected as follows:

President, T. C. Oliver, Chemical Construction company. Vice-Presidents, E. E. Finch, Karl Kiefer Machine company; J. George Lehman, Bethlehem Foundry & Machine company; Peirce D. Schenck, The Duriron company. Treasurer, P. S. Barnes, The Pfaudler company. Directors, Harlowe Hardinge, Hardinge company; P. B. Sadtler, Swenson Evaporator company; H. N. Spicer, The Dorr company; R. Gordon Walker, Oliver Continuous Filter company; G. O. Carter, Union Carbide company.

For the sixth place on the board of directors Messrs. Robert McKay, International Nickel company and L. S. Thurston, General Electric company, received an equal number of votes. One of these two will be elected to the Board by the balance of the directors.

President Oliver has announced the appointment of a committee to formulate plans for an exposition as follows: Edwin C. Alford, T. Shriver & Company, Chairman; Peirce D. Schenck, The Duriron company; E. E. Finch, The Karl Kiefer Machine company.

The committee has been in session and has made considerable progress, it has been announced, in establishing general principles upon which definite plans will be based for presentation to the association.

The new board of directors of the association has been in session also and it is announced that every confidence exists that the activities of the association will both widen and become more intensive within the next year.

Link-Belt Acquires Meese & Gottfried Co.

Charles Piez, president of the Link-Belt company, Chicago, announces the purchase of the Meese & Gottfried Co., of San Francisco, Los Angeles, Seattle and Portland.

For the past ten years Link-Belt company has been distributing its products on the West Coast through its subsidiaries, the Link-Belt Northwest company, of Seattle, and the Link-Belt Pacific company, of San Francisco. The improvement in distributing facilities effected by the consolidation, and the additional manufacturing facilities acquired, should give the rapidly-growing industries of the Pacific coast highly economical and efficient service.

Meese & Gottfried Co. and its predecessors have been manufacturers of power transmission machinery and distributors of conveying and transmission machinery on the coast for more than forty years, and were well and favorably known from the Canadian to the Mexican border. It is the intention of the new owners to add to the facilities and enlarge present stocks, so that prompter service to its customers will be insured.

The new organization will be known as Link-Belt Meese & Gottfried Co., with headquarters at San Francisco. The officials will be: Charles Piez, chairman of the board; B. A. Gayman, president; Harold H. Clark, vice-president and sales manager; Leslie W. Shirley, treasurer; Richard W. Yerkes, secretary.

Mr. Yerkes came to Chicago from the Link-Belt Philadelphia plant, as the newly-elected treasurer and secretary of the Link-Belt company, to succeed Mr. Gayman. All officers, with the exception of Mr. Piez and Mr. Yerkes, are located at the company's headquarters, San Francisco.

In Seattle, the Link-Belt Northwest offices, warehouse and shop will house the new organization, while at San Francisco, Portland and Los Angeles, the former Meese & Gottfried plants will be used.

Housing Shortage at Vancouver

The steel for the paper mill proper of the Columbia river Paper Mills corporation's new plant at Vancouver, Washington, is being fabricated in mills in the East at the present time.

The contractors erecting the structure have signed an agreement to have the building completed 90 days after the steel is on the grounds. The building, 80 feet by 380 feet, will be constructed mostly of steel, concrete and glass materials. This is a three-unit mill. The sawmill and three acid towers were erected during the summer season. The sawmill when running full time will employ 120 men.

W. B. DuBois, vice-president of the Columbia River Paper Mills corporation, in an address before the Vancouver Chamber of Commerce, said that an acute housing problem was being faced by the city of Vancouver. The new men employed at the construction of the paper mill were finding it exceedingly difficult to get suitable houses in which to live. Plans were discussed for building a large number of moderately priced houses to be sold on an easy payment plan and before the meeting adjourned it was decided to appoint a committee of six to investigate the conditions and the cost of erecting the houses. When the new paper mill is in operation several hundred men will find employment in it, and they should be able to secure homes near their work, so Mr. DuBois thinks.

Crown-Willamette Cooperative Plan

The Crown-Willamette Paper company, the largest and most important paper manufacturer on the Pacific coast, has issued a pamphlet containing a plan whereby the more than 7000 employes of the company may invest in shares of its capital stock.

The pamphlet is divided into two sections. The first section gives the employes' Stock investment and savings plan, and the second section of the pamphlet explains its operation and essential features.

The Crown-Willamette Paper company does not make the purchase of shares in the company obligatory on its employes but it hopes that they will realize the benefits that will accrue to them if they invest their savings in a safe firm.

The company believes that close co-operation between employer and employes is essential both to the efficiency and prosperity of the company and to the happiness and welfare of the employes. This thought was in the mind of the president, Louis Bloch, when he formulated the plan of a business co-operation of the company and its employes. This company has been comparatively free from labor troubles in the past.

Herbert A. Wilder

Herbert A. Wilder, director of the International Paper Company and for years a paper manufacturer in New England, died Oct. 12 at the Phillips house, Boston, which is part of the Massachusetts General hospital. His home was in Newton, Mass.

Mr. Wilder was born June 22, 1837, the son of Charles B. and Mary Ann (Guild) Wilder, in Attleboro, Mass. He had lived in Chelsea, Winchester and Newton, Mass., where Mrs. Wilder died in 1881.

As a boy he started in the paper business with his father. From 1854 until 1897 he was associated with his brother, the late Charles T. Wilder, in the firm of Wilder & Co., of Boston. After the big Boston fire of 1872 the firm increased its work in manufacturing wood pulp and news paper and enlarged its mills at Ashland, N. H. and Yyndon and Barnet, Vt.

In 1883 they secured power rights on the Connecticut river and built the pulp and newsprint mills at Olcott Falls, now Wilder, Vt. Subsequently all of these mills were sold to the International Paper Co. and Mr. Wilder became a director of that corporation.

Mr. Wilder was widely interested in educational institutions. He was a trustee of Atlanta university, Berea college, was a member of the prudential committee of the American Board of Foreign Missions and a trustee of the Newton hospital.

He is survived by three daughters, all of Newton, Mass.

Fire in Oregon Mill

Fire originating from an explosion of dry wood dust in the digester unit of the Hawley Pulp and Paper Mills, at Oregon City, Oregon, Sunday night October 7, destroyed the plant with an estimated loss of $750,000 and also damaged the adjacent plants of the Crown-Willamette Paper company and the Oregon City woolen mills. The total loss may reach $1,000,000, although a later estimate places the Crown-Willamette Paper plant damage at a smaller figure than the first estimate gave it.

One workman was overcome by the smoke and had to be dragged to safety. More than a score of employes were trapped in the building and leaped through doors and windows to save themselves. It is thought that no lives were lost in the conflagration but the ruins are being carefully examined to make certain that no one perished.

Ninety per cent of the Hawley Pulp and Paper Mills' loss is covered by insurance and Willard P. Hawley, president of the company, announced that the mill would be replaced at once by a new and more modern structure. The mill destroyed was built in the early 50's and was then used as a flour mill. When the paper company acquired the building it was remodeled to suit its needs.

Demand Keeps Pace with Increased Production

Canadian newsprint mills during August broke all records for a single month's production, the total touching 114,721 tons, or a daily average of 4,249 tons. This exceeded the previous record by over 2,600 tons.

The high daily average is impressive and illustrates the expansion of this industry, 4,249 tons being 96 ahead of that for the month of May and 4¼ ahead of that for February. For the first eight months of the current year Canadian mills averaged 647 tons daily more than the average for the same period in 1922. During this time the total production was 842,334, as compared with 704,929 for the same period last year. The daily average during these months this year has been 4,069 tons as against 3,422 for the preceding period.

Such a rapid increase in production has resulted in a slight increase in stocks in hand, but not to any very great extent. Canadian mills at the end of August reported such stocks as being 15,631 tons, as compared with 11,813 tons at the end of August, 1922. This increase of 4,000 tons represents, however, less than one day's production and the stocks on hand at the foregoing date amounted to less than four days' production at these mills.

Newsprint Mill at Winnipeg

Erection of the first pulp and paper plant in the prairie provinces at a cost of $3,000,000 has begun near Winnipeg. The plant will have an initial capacity of 120 tons of newsprint a day and will, it is believed, furnish paper to the Middle Western market of the United States.

Location of the plant in the West, it is said, is an indication of the expansion of the Canadian newsprint industry. It was once thought that the pulpwood supplies of the prairie provinces would not be called into requisition for years, but the increasing consumption of the Middle Western States and their proximity to the prairie provinces has brought about the demand.

Alexander Home from Orient

L. M. Alexander, president and general manager of the Nekoosa Edwards Paper company, returned home on Thursday October 11th from a two months vacation.

Mrs. Alexander, who accompanied her husband on the trip, stopped off at St. Helena, California to visit with relatives while Mr. Alexander continued to Spokane, Washington, on a business trip to the Inland Empire Paper company at that place where he is interested, coming direct to Port Edwards from that place.

Natwick Now General Superintendent

Former associates in Wisconsin Rapids have received word of the appointment of A. G. Natwick, formerly with the Nekoosa-Edwards company, to the position of general superintendent of the Lincoln Mills, Ltd., of Merritton, Ont., large manufacturers of paper.

Until recently he was superintendent of the sulphite mill in the Ontario plant. He spent eight years in the laboratory and various departments of the Nekoosa-Edwards mills at Wisconsin Rapids and when he left he was night superintendent.

Wisconsin Men at Chicago Meeting

Among the Neenah and Menasha paper mill men who attended the convention of the American Pulp and Paper association in Chicago were R. C. Brown, Kimberly Stuart, D. K. Brown, George M. Gilbert, D. W. Bergstorm and J. N. Bergstrom.

A number of Kimberly-Clark executives who have been in the east on business also were expected to stop off on their return and attend the sessions. In the party were F. J. Sensenbrenner, J. C. Kimberly and Raymond Kelly.

Improving at Wausau Mills

The work at the Wausau Paper Mills Co., Brokaw, Wisconsin on the new dam is progressing and will be closed in before winter.

The new wood room is in operation and the new Wausau Iron Works drum barker a success, according to Superintendent Boyce.

The digesters are being lined in sulphite mill and some speedy work being done by Superintendent Ware in the way of cooking sulphite of high strength.

Attitude Toward Study of Mill Men

Old Antagonism Between Practical Operatives and the College Trained Men Disappearing as Demand for Increased Production Calls for Intensive Scientific Methods

By T. Linsey Crossley

Institute of Industrial and Domestic Arts, Gardenvale, P. Q.

At a meeting of the Technical Association of the Pulp and Paper Industry held on Thursday, September 20, at the national exposition of chemical industries, Grand Central palace, New York, several papers of interest to pulp and paper plant technical men were presented, among them being this one by Mr. Crossley which detailed some of his experience and observations while endeavoring to introduce a correspondence course in pulp and paper manufacture based on the text books of the committee on Vocational Education.

HELLO! Supe said you were comin' in this shift to sell some school stuff, to learn a feller to make paper out of a book." That's part of what Bill Watermark said when I dropped in on the night shift at the X paper mill. Bill further enlarged on the disagreeable experiences of his soul in the hereafter if he ever had anything to do with learning to make paper out of a book. Bill is a little hard-boiled, though only thirty-one. He has been making paper fifteen years, and all kinds. He said he didn't mind hearing what the idea was, but guessed it wouldn't help much.

"Slack her off a bit, Yes! Slack" he yelled to his back tender "having trouble with her. Got a new felt on and it's runnin' forward on the back side, and there's a bum deckle strap on the front. That's a special order:—told Supe when I went off this morning, not to run it till I came on again. Ain't anyone in this mill can run that stuff over that machine but me, and the machine tender on that shift knows as much about tag as I do about airplanes. When I came in tonight they'd made about three hundred pounds, and I made the fourth hand stay overtime to clear up the floor. Well, you were going to tell me about these courses?"

It came out that Bill was expecting shortly through an old friend to become assistant superintendent of a small mill with a chequered financial history and later succeed his friend who was leaving. We discussed this project and it became apparent that Bill was nervous as to his general education. We talked about an hour with interruption, such as that stated above. Eventually he decided to take the full course —"soup to nuts" he said. He found that our courses would not only complete for him the fundamentals of a general education in mathematics and science, but also furnish very helpful information and instruction on the principles and practice of his own work.

Evidences of Interest

In a big northern news mill I came across the wet room foreman. He'd been out to a dance in the evening and had been in just long enough to be a little grouchy and chilled. He was reading a bulletin sent out by the company describing and giving approval to the courses. I asked him what he thought about it. "I don't think a hell of a lot of it," said he. When asked if he wouldn't like to know more of it before he threw it down so hard, he said. "Gee! do you want to argue about it? That's fine; come on down to the motor room, there's a bench there and it's warmer." So we argued, and he decided he would need to know more. In fact it was evident that he had been interested before we had our argument.

These two incidents which are as nearly accurate as memory can make them, show very clearly the attitude of a large number of men in the industry. They know the industry is getting away from the conditions of their earlier experience and they are thinking. First, there is resentment roused by a sense of injustice. This is not improved when they see men who have had little or no practical experience getting good salaries in "white collar" jobs, having authority over seasoned practical men. Second, there is realization that practical experience is not the all and end all of pulp and paper making today.

There are several agencies making use of the courses provided in the text books being published by the joint executive committee, but the pulp and paper faculty of the Institute of Industrial and Domestic Arts, Gardenvale, Quebec, is the only one using the individual canvass method. It is, therefore, likely that we have had more opportunity of getting frank views on this question from the men in the mill.

It might be pointed out incidentally that an outsider, if careful, can get a freer expression of such views.

There are almost as many attitudes as there are individuals. The limit on one extreme is that the whole thing is a scheme to make the practical man divulge his hard won knowledge for the benefit of the callow university men with "pull," who will get all the gilt-edged jobs.

A cognate case is that of the man who decides to take a course but doesn't want anybody to know it, either to forestall being pumped or to prevent having fun poked at him.

In one mill the superintendent was such a reactionary that two men who wanted to enter the course didn't want to take any chance of his hearing about it because they might lose their jobs.

Attitude Favorable in Most Cases

In the great majority of cases the attitude is favorable, various reasons for not entering being given by those who would like to study the courses but are obliged to refrain. Domestic expenses, sickness or property involvements are chief. Many men think they are too old at thirty to thirty-five. Of course, many are really too old. Lack of confidence keeps many men from entering.

At the other extreme is the man who said he had been waiting six years for just this opportunity and lost no time in signing up for a full course when he had looked over the list of subjects covered.

It is surprising what a lot of men in the paper mills are carrying on other businesses, farms, garages, poultry or groceries. Farming seems to be a sort of papermaker's Beulah-Land. He wants to spend a little time there before he goes to heaven.

Now for a few words as to the attitude of the employer. Similar views are found here depending in large measure on the personal history of the man in question, because of course, many executives are graduates from the ranks.

Pointing a Moral

A workman was dying, life was ebbing fast, his faithful wife asked if anything could be done for him. "Yes," he said, with a brightening eye, "bring me a piece of pine with a wood-screw driven half into it, and a screwdriver." This was done.

The dying man with sudden access of strength raised himself in bed and drove the screw home, then fell back exhausted but with a triumphant smile. "For seven years—I've started screws in wood—I've always wanted to finish the job—now I've done it."

Three girls working in the finishing room, were pasting, wrapping and packing little bundles of a specialty. Each girl was doing all three operations. The plant engineer advised having the work arranged so that each girl would do only one of the three operations. The president said, "They are girls, I want them to stay girls, not be degraded into machines. We can make dividends other ways."

A few years ago the idea was that in industrial work a man should be paid only on the basis of what he did. Along this line is a legend of a gentleman appointed to arbitrate in a question of wages in pulp mills. The grinder man's job was under discussion. "And what does he do?" said the arbitrator. "Oh!" said one of the committee, "all he does is to raise the lever, open the pocket, put in a block or two of wood off this pile, and shut it up again." "Then of course he is only unskilled labor," said the arbitrator.

At that valuation most of us are unskilled labor. We pick up a pen or pencil and make more or less intelligible signs on paper, or we press a button under our desk, which brings a young woman who makes signs for us, while we mess up some English by certain operations with our tongue and vocal chords, complicated by chewing a cigar. She lines them up, operates a machine that spreads them on paper, and we sign them. Why isn't the young lady paid more than the man whose strange sounds she has made effective?

Leaving aside certain building trades operations and the very important, though undervalued matter of loyalty, what is the difference between the $1,500 man and the $5,000 man if we are to be paid for what we do?

From another viewpoint: Here's a man who has worked ten years on a job calling for dexterity of hand or foot. He prides himself on his dexterity and nimbleness. He has a good job, well paid. Why should he worry about life? Some stroke of fate makes hand or foot useless. His earning power is gone and he must start all over again—a long, hard road—he probably has no educational basis.

Cultivation of Thinking Capacity

Time-motion studies, ability to handle machinery; the purely physical operations of industry have had their day; they will continue to be large factors in mill work, but they are of secondary importance to the ability to think.

This is especially the case in industries where democracy prevails.

One of these is the paper and pulp industry. Thirteen years ago the manager of a large corporation was seen by the writer about educational development in the pulp and paper industry. "Who would you educate? I want my workmen to do what they are told to do, and not argue about it." It is said the German army failed largely because the soldiers were trained not to think but merely to obey orders.

The pulp and paper industry has come to the conclusion generally, along with most others, that man's head is the most valuable asset both to himself and his employer. He can worry along without arms, legs, eyes, ears and even stomach, so long as his head is well stocked. If his head's gone there's nothing to worry about.

Hence industrial education has developed from the vocational or cook-book form up to the more scientific form wherein the basic principles are elucidated, to produce action by the coupling of cause and effect.

In the pulp and paper industry of America, in other countries also, but we are concerned just now about America—there have been very interesting developments in the application of science owing to the demand for enormously increased production. Up to twenty-five years ago the industry had been developed slowly, handicapped by traditional ideas, a limited literature and a conservative personnel.

With the introduction of scientific methods the need of cooperation between the scientist and the operative became apparent. A certain resentment, unexpressed in many cases, but picturesquely expressed at times, served to delay or render abortive the introduction of scientific methods. Indeed the chance of putting over a "bum steer" on the technical man has been only too tempting at times. For instance, losses well known to men in the mill are not reported. "Let them find it out for themselves. That's their job."

University Men Taking the Course

Diplomacy and tact might become subjects of a special course for some of our less experienced technical men, or, better still, a year or two in overalls on shift work. It is gratifying to note a tendency in that direction on the part of university men.

About 20 percent of the men enrolled in these courses are university men. One of these when he started the course was boss finisher. Shortly afterward, wanting to see him, I had to go to the time office, and I found him rated as unskilled labor helping on the beaters. Others are working as truckmen, broke hustlers or grinder men.

Of the nearly four hundred men now enrolled for these courses under the Institute of Industrial and Domestic Arts 21 percent are university graduates, 35 percent have studied in high school, night school or correspondence courses, and 44 percent went no further than public or grammar school.

The occupations represent about seventy different jobs, some of which are:—Four general managers, 8 superintendents, 5 assistant superintendents, 7 boss machine tenders, 50 machine tenders, 21 back tenders, 52 other members of machine crews, 9 foremen finishers, 14 other finishing department workers, 9 beater engineers and helpers, 5 grinder room foremen, 7 grinder men, 8 cooks and cooks' helpers, 5 acid makers, 5 wetroom foremen, 6 wetroom tenders, 7 chief engineers and assistants, 38 chemists and laboratory workers, 5 research efficiency and cost workers, 25 office workers, 19 machine shop and repair crew workers.

Besides these there are many positions only represented by one or two each. Among the miscellaneous jobs are one photographer, one forester and two blacksmiths.

Ages are from 17 to 60, though there is only one over 50. He says he has been a beater engineer for 40 years and wants to know more about it before he dies.

It will be noted that 50 percent are between 21 and 30, and that 80 percent are under 36.

Co-operation of Employers

The only successful method of approach has been by individual interviews in the mills. In a few cases these have led to appointments to see men at their homes, but unless the man can be seen first it may take two or three visits to his house before he can be seen. In most cases we are given a list of likely men by the management and allowed to see them in the mills. In some cases the mills issue notices or bulletins to employes.

Any form of active support by the companies is a great help; in fact, we have had practically no results in some important mills where executive cooperation was lacking. Sometimes fear is expressed that men may be oversold on this idea. This would be as undesirable to us as to anyone. We do not hesitate to tell men that this work requires backbone and perseverance and entails some sacrifice of time and pleasure. But the habit of study soon brings pleasure in reading and satisfaction in mental accomplishment.

Paper Standardization

Advantages of Standard Methods and Standard Specifications in Buying and Selling Paper

By Hubb Bell

United States Testing Company, Inc., New York

In a paper contributed to the meeting arranged by the Technical Association of the Pulp and Paper industry in connection with the National Exposition of chemical industries at Grand Central palace, New York, on September 20, Hubb Bell, of the United States Testing Company, Inc., New York, reviewed in a capable and careful manner the methods of controlling the quality of paper and also discussed the use of tests by consumers.

IT is a well-known fact that there has been a lack of attention to standardization and simplified practice by the paper industry.

Statistics show that there are 800 terms used in the buying and merchandizing of paper; there are 150 to 200 distinct kinds of paper and the number of uses of each is unknown; of 177 books 101 showed different page sizes; 230 sales house organs had 85 different sizes, 496 trade magazines had 95 different sizes and 57 national magazines had 27 different sizes.

Standardization is a very complex subject. In general, it means to single out specific products and materials, to settle upon their properties and dimensions, and to concentrate upon them in production and in use—all to the end of bringing about the greatest overall industrial efficiency possible. This involves nomenclature, purchase specifications, methods of test, uniformity in dimensions, and concentration upon the optimum number of types, sizes and grades of manufactured products.

Most of these factors have an intimate bearing on specifications. A definition of a project or of a process or application often is merely a specification in itself. Conversely, a specification in the larger sense is nothing but an elaborate definition. The specifications for a commodity are really the writing down specifically of what the buyer or purchaser wants, so that the buyer can write or wire, "send me 100 pounds of bond paper," and it seems something perfectly definite and specific to both of them.

It is perfectly feasible to make definite recommendations as to specifications of quality for commercial use. Test methods are sufficiently standardized and there are a sufficient number of mills under technical control to warrant this step.

The Standardization of Paper by Tests

In preparing standard methods and standard specifications, the fullest co-operation must be obtained from manufacturers and consumers, and the standardization thereby effected will enable the buyer and the seller to speak the same language. In overcoming the prejudice against standardization, the manufacturer has learned that it is possible for him to produce a far better quality of product, and at the same time greatly reduce his expenses through mass production. This lower cost makes it possible not only to offer to the public better materials at lower unit prices, but also to maintain at the same time higher wages for labor.

American standards of quality, having forced recognition throughout the world, have stabilized production and employment through the broadening effect of increased markets, and have made it safe for manufacturers to accumulate stocks during dull periods, when, without such standards, such a policy would have been extremely hazardous not only to the manufacturer but also to the general public.

Although standardization restricts the varieties for selection, it permits concentration of thought and skill upon design, so that the products may be more economically and efficiently handled. It also reduces the maintenance cost of the finished structure by simplifying the stock necessary for their maintenance. Well established standards have developed that factor of safety which is essential for the producer in making the finished product. Moreover, the care which is exercised in the preparation of standards gives full assurance to the public that the materials purchased and tested in accordance with standard specifications and standard methods will result in furnishing the best that can be produced, at the lowest possible cost, and at the same time will afford all safety necessary to the public welfare.

The American Society for Testing Materials, whose membership consists of technical men, has for its purpose "the promotion of knowledge of the materials of engineering and the standardization of specifications and the methods of testing." Their standards have been adopted in the following field of materials: Ferrous metals, including practically all iron and steel products; non-ferrous metals, including products of copper, zinc, lead, aluminum and alloys; cement, lime, gypsum and clay products; preservative coatings, including oils, pigments and paints; petroleum products and lubricants; road materials, coal and coke, timber, waterproofing, insulating, shipping containers, rubber products, textiles.

Representative Samples Necessary

Paper can easily be placed on a similar basis since the technique of testing of paper in this country is clearly standardized, and is just being recognized as of much importance.

The paper industry now has available official standard methods. The paper testing methods of the Technical Association of the Pulp and Paper Industry are defined and standardized so that comparable results can be obtained by different laboratories.

A very important aspect of the technical study of paper, which is covered in the above-mentioned methods, is the proper, intelligent and systematic method of procuring portions of a lot of paper which may be duly considered to be a representative sample of that lot. Unless this is done, the value of any test is somewhat depreciated by not knowing whether the sample represents the lot of paper in question. It is believed that proper sampling is important both in the mill during manufacture and also at the point of delivery or shipment to determine the quality of the paper received. Owing to the method of manufacture of paper, the lack of uniformity on paper, and the errors introduced during the testing of paper, definite systematic tolerances are given.

The combinations and proportions in which pulps are mixed in the manufacture of papers are innumerable, and as a consequence it is difficult to know, without scientific testing, what the papers may be that one is using, or to buy a paper by name alone for a specific purpose, and know for a certainty that it will stand up in service.

An old papermaker can, with a great deal of certainly, tell from an examination of a sheet of paper much of its history, and among a number of different papers pick out the one most suitable for the purpose for which it is to be used. But appearances and names are not the best guides.

Service quality tests are always made in both directions of a paper for uniformity; however, the weakest direction must be considered first, as in all materials nothing is stronger than its weakest point. Perfect uniformity is not practicable, because of the method of manufacture, the many different proportions of the pulps, and the use of waste and scrap materials.

The color of a paper does not indicate what kind of a paper it is, for colors are used to disguise the makeup or to make it more attractive. Often a fancy felt or a special roll is used to imprint a design into the paper, and practices of the industry have become so mixed that it is difficult to tell, from the name applied, just what the paper is made of; but the characteristics of any sheet will always be substantially the summation of the characteristics of the raw materials employed in its manufacture, and a fair estimation can be made as to the comparative qualities of a paper if the raw materials which were used are known. It follows, then, that to intelligently select a paper for a specific purpose, the conditions under which it is to be used, and the severity of the service which it must render, must first be considered; and, knowing them, the kind of paper, the weight and the finish which will best meet the requirements and be best suited for the purpose can be efficiently selected.

It is clear to anyone that it makes no difference what classification a paper is sold under, unless the mill-brand or watermark establishes beyond a doubt that the designation insures that the paper sold under this class has certain important properties and characteristics which are essential to the successful and satisfactory usage of that paper.

Value of Paper Testing

Paper testing for the purpose of determining relative values for these important characteristics has been in use by competent and experienced manufacturers for many years as a means of insuring against defective papers and undue costs. From these tests manufacturers have learned to recognize certain limits for each property outside of which they do not care to go. The limits may vary for different kinds of paper, depending on what conditions they must withstand in use.

One expects, therefore, to find these limits reflected in classification in a quite definite way, but on inquiry discovers that no one can define a class in definite terms with numerical coefficients.

Paper testing is, of course, primarily of value to the consumer, who is to be found in practically every line of business. Often large sums of money are spent on the item of paper alone, but as a rule the consumer has no way of judging the character or quality of the paper or its suitability to his particular needs, except through observation or the word of the salesman who is selling it to him, and who is, of course, chiefly concerned in making a sale. That observation counts for a great deal in determining the suitability of a paper and in the estimation of widely different types cannot be gain-said, but can observation tell, which of two writing papers is the better? They may look and feel much alike and yet be widely different in quality and have many different properties.

The consumer can make the seller submit samples and estimates of the particular kind of paper he wishes. He will then have a chance to compare the kinds and qualities of paper on the market and the prices of the different firms. He gets a greater variety to choose from, and also, by letting it be known that the samples are submitted on specification, gets the best price possible for the given quality of goods. Paper testing here performs the duty of determining which sample represents the best value for the money.

In controlling shipments paper testing is also of value as it shows whether the paper is up to specification and whether the consumer is getting what he contracted for. The United States Government is controlling the quality of all the paper used in the different departments by buying on specification and by testing shipments, and in many cases actually getting a better paper at a cheaper price.

In view of the foregoing it may be stated that paper testing in general is of use:

(1.) In determining the best values obtained from money paid.

(2.) In buying on specification determining which paper submitted is most suitable and economical.

(3.) In insuring uniform deliveries and maintenance of quality.

What is needed to bring about the desired definiteness in the standardization of papers is that the accumulated experience in terms of tests be brought together and analysed with respects to the bearing of these properties individually to conform to the tests and limits found desirable in practice, independently of the classification as it now exists, and with respect to the limits to be set for in each property. It is only necessary for the consumers to agree on the specification and to be able and willing to have tests made to insure that they are getting what they specify.

The subject of the standardization of paper by tests is one which should interest a large number of people connected with industries which demand the use of paper and allied products. On the one hand is the papermaker producing the finished article, and on the other hand there are the printers, publishers, book binders, paper agents and stationers, who supply the general public.

Of recent years there has been a good deal of agitation as to the inferior quulities of the paper used at the present day, and it is evident that much of the paper brought into the market will not last any length of time. It is quite true of the paper trade as of many other industries that the demand for cheapness has superseded the desire for an article of high quality, yet the papermaker of the present day can produce a paper quite equal to any that has ever been made, for it is really a question of prices.

Standard Tests Necessary

The purchase of paper is too often based on the qualities of appearance and price. Until we have standards of quality in terms of tests rather than those of purely commercial consideration, there will always be many cases wherein the price paid is highest for paper made from the least valuable material. But so long as there is an absence of standards of quality by tests this unsatisfactory state of things will continue. It may be traced partly to a want of interest in the subject, and partly to the lack of cooperation among those concerned. The keen competition among manufacturers which has resulted in the creation of the false and arbitrary standards connected with the mere appearance of the paper, as well as mill-brands, is also another reason, while an indifference to the scientific aspect of the question has generally been the prime factor.

Methods of controlling the quality of paper should be as scientific as is consistent with their practical value. Systematic testing will enable competition to be met on the basis of actual quality and value. Every paper does not require a full test to enable one to judge quality, uniformity and utility. For example, a bond, ledger and writing paper for best quality should have a high resistance to wear and tear and to friction and folding caused by repeated crumpling or creasing.

Variations in the relative humidity of the atmosphere have a decided effect on the physical properties of paper. The results of all physical tests on papers are affected to a greater or less degree by the ordinary variations of the relative hu-

Forestry in the Paper Industry

Conducted by J. R. Simmons, Secretary Forester,
The New York State Forestry Association

Forestry Program at Washington

Vigorous Effort for National Legislation that Will Promote Cooperation with Private Owners

Definite forestry legislation of a national character is to be actively pushed at Washington beginning in December. Probably three bills will be introduced in the senate and house early in the session, but there will not be a serious difference in character in any of the three bills.

This was disclosed at a recent meeting in New York of the National Forestry Program committee, of which R. S. Kellogg, secretary of the Newsprint Service bureau is chairman, and Warren B. Bullock, of the American Paper & Pulp association, secretary.

The committee met to discuss the developments of the past year along forestry legislation lines and to determine its future activities. It was the unanimous sentiment that the work of the committee, which centralized the movement for a national forestry policy law, should be continued with increasing activity.

The committee will devote its future efforts to the actual securing of legislation to carry into effect its proposals based on the need for active cooperation between Federal and state governments and the private timberland owners. That the future forest of the nation will be divided in the proportion of about 40 per cent public, and 60 per cent private, was the general sentiment, and the need for public cooperation with the private owner, rather than control of private property by the state and national governments, was considered to be most important.

In general, the committee will continue its efforts to see such cooperative legislation enacted. It now seems certain that Bertrand H. Snell, author of the original Snell bill introduced in the Senate with few vital changes by Senator C. H. McCormick, will again be introduced by the New York congressman, himself formerly interested in the paper industry. Congressman Clarke will introduce again his bill which provides for immediate appropriation for fire prevention and similar emergency requirements.

The most important new bill, however, will be that of the United States Senate Committee on Reforestation, which will in the next few weeks complete its national series of hearings on the whole forestry question. The committee's report, it is expected, will be accompanied by a committee bill to put into effect such policies as the investigations have found to be necessary. The result of the committee's investigations will be watched with great interest by all those interested in forestry developments.

This committee has two more hearings partially scheduled in the field before the final hearings to round up the whole investigation. The last hearing will be held in Washington. Chairman Kellogg of the National Forestry Program committee has been asked to appear there.

The latest hearings of the Senate committee have involved largely the New England situation and its relationship to the paper industry. At Albany, G. W. Sisson, Jr., former president of the American Paper & Pulp association, was one of those appearing for the New York paper manufacturers. At Boston various New England men appeared, while at Bangor, Maine, the paper industry was again represented by Dr. Hugh P. Baker, secretary of the American Paper & Pulp association.

With these three bills in progress there seems reason to anticipate that definite action may result. The congressional activity will certainly not be affected adversely by the National Chamber of Commerce referendum, the result of which will be made known Nov. 17th, two weeks before Congress meets.

The Jack Pine and Popple

Among the men whose names appear often in connection with the national forestry is Dr. Raphael Zon, forest economist in the research branch of the U. S. Forest Service, and now also chief of the new lake states federal forest experiments station. Dr. Zon's statements and the results of his many investigations are always interesting and instructive.

Speaking recently before the Woodlands section of the American Paper and Pulp association at Chicago he said, "The despised jack pine and popple will come into their own within a few years as the salvation of the forestry problem in America."

He adds the information, however, that a saw-fly of a different species but of the same genus that worked havoc among the larch, has made its appearance among the jack pines.

Dr. Zon says that the jack pine and popple are proving so satisfactory for sulphite pulp that their rapid growth will be a most important factor in future pulpwood operations. He also forecasts the eventful conversion of timber into fabricated building material, and predicts that our present methods of cutting logs into board and will in time be considered primitive.'

If this is the trend of our times it is reasonable to conclude that the predicted changes will come about through application of the principles of paper making to the manufacture of fabricated board.

Forestry Work by Lumber Company

The paper industry has properly boasted of its preeminence in the introduction of forestry into its woods operation. The lumber industry is rapidly developing a lively interest also, as seen in the recent undertaking by the Long-Bell company, one of the greatest of the southern lumber companies.

John B. Woods, a forest engineer, has been engaged to make a survey of 750,000 acres of land in four southern states, comprising two blocks of land in eastern Texas, four in western and southern Louisana, and one each in eastern Mississippi and Northern Arkansas

The objective of the survey is to determine the character of the land and other conditions requisite to the reforestation or timber management of all the areas. The survey contemplates the permanency of forest operations in the south by this company, or at least the prospect of half a century more of operation.

Hauling Logs Through Snow

How to faciliate logging transportation in winter is a problem which will be attacked in a new way this winter. This is a development of the convention plans of the Woodlands section of the American Paper & Pulp association for the Chicago paper week conference.

Through the cooperation of the section a plan is now being formulated for a field demonstration of a new motor-driven machine during the coming season. Paper company foresters of the entire eastern region will be given an opportunity to attend the demonstration when dates and plans are perfected.

Wanted—A National Forestry Policy

A COLUMBUS DAY editorial in one of our leading newspapers brings to mind that inherent quality in the American people which enables them, decade after decade, to meet their obligations and work out their destiny. By that quality we have come to be known as a nation that does things according to a certain method all its own. Often it is a slow method, but it is usually a sure one. Sometimes it is spoken of as "the good old American way".

A recent adverse criticism by an English newspaper on the subject of our struggle with the prohibition question ends with the rather complimentary remark that "hands off is the best advice, for if America be given a chance to work out the problem she has so courageously tackled, she will eventually solve it."

We have set our hands to the plow in the matter of forestry legislation, with a view to the adoption of some definite forest policy. The events of the last few weeks indicate the general trend which early congressional action will take and the preliminary work, carried on by congressional committees and business groups, is now practically complete.

In our last issue reference was made to the referendum contemplated by the national Chamber of Commerce. The thoughtfulness with which the forest problem is being faced is also shown by the very comprehensive group of interests that appeared before the U. S. Senate Committee on Reforestation at its Albany meeting of Sept. 21st. Subsequent meetings developed the same general interest. There appeared before the Albany conference at least two representatives from the paper industry, two from the lumber industry, four from the conservation department of the State, two from the colleges of forestry, and a corresponding number from business at large and from such private organizations as the State Forestry association. The committee itself is made up of Senators from five states, and includes the chief forester of the United States.

There is manifest, everywhere, a spirit of sincerity and helpfulness; a desire to conciliate, and a determination to get down to business on a policy which all will agree to give an honest test. What we need is a policy that can be whole-heartedly installed in place of the old one of cutting the timber faster than it can be grown. The American people will eventually adopt such a policy. The interesting question is—"Will they do it this winter?"

Glassine and Cellophane

Glassine paper differs from cellophane in being a true paper which has acquired its transparency and sheen from long beating of the pulp in the engine and subsequent calendering.

Cellophane, on the other hand, is formed from a chemical solution of cellulose and special after treatment.

Each may be beautifully embossed with lacelike tracings by passing the material under an embossing roll.

Annual Red Cross Roll Call

The paper trade in New York City is co-operating actively with the Red Cross in its annual roll call, which opens Armistice day, November 11, and continues until Thanksgiving, for the enlistment of new memberships to maintain the organization's manifold peace-time program of relief and public health work.

Three special committees composed of representative leaders in the various branches of the paper trade have been formed in accordance with the campaign plan of organizing the entire city into various industrial, mercantile and professional groups to facilitate the Roll Call effort.

Each committee is headed by its own chairman. Joseph McCormick, of the American Paper Mills company, 261 Eighth avenue, is acting as chairman of the Paper Manufacturers and Paper Dealers group; A. D. Morstadt, of the Union Paper company, 844 Washington street, is chairman of a similarly organized committee to cover the Paper Boxes group, and a Stationers group is functioning under the chairmanship of William E. Ward, of John Ward and Sons, 115 Cedar street.

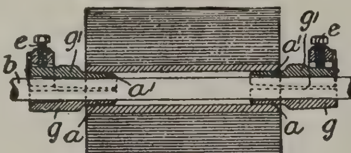
These special roll call committees are functioning actively to secure the maximum response to the roll call throughout their particular field, and plans are already under way to reach every person in the paper trade directly with the Red Cross appeal.

Help for the ex-service man and his family, including legal assistance, loans of money, advice on domestic matters and medical care constitutes a major part of the work in New York for whose maintenance the annual roll call is conducted. The Red Cross activities in New York City also include disaster relief and a public health program among whose features are the supplying of surgical dressings to 22 local hospitals, nursing service, first aid, and work in home hygiene and care of the sick.

New Developments in Paper Making

Fastening Paper Rolls

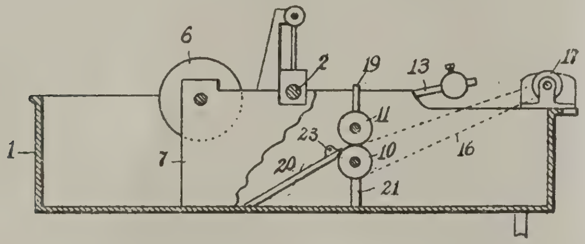
The following diagram shows a method of fastening paper rolls which is patented in Great Britain. A pair of devices is used each of which consists of two members g and g', having



conical surfaces adapted to bear upon the shaft b and to rock thereon, so that the inner ends a, a' of the mengers g, g' may expand and grip the bore of the roll. This expansion is effected by a screw which passes through a looped part of the member g and bears against the other part g'.

Beater With Washing Arrangement

The accompanying figure shows a beater with a washing attachment which is patented in British patent No. 181,220. (close to the beater roll and the opposite side of the mid-



feather 7 of the beater trough there is arranged a washing attachment which consists of a wash drum 6 and a pair of rolls 10, 11, of which the lower roll runs in fixed bearings. This roll 10 is driven by an electric motor 17 by means of a belt 16. The upper roll 11 rotates in movable bearings and the pressure of this on the lower roll 10 is regulated by means of the weighted lever 13. The two rolls 10 and 11 are provided with scrapers 19 and 21. A board 20 is arranged at the point of contact between the two rolls.

After the mass of stock has passed through the beater proper it is pushed up the inclined board 20 and enters between the rolls 10 and 11. The stock is subjected to a rather strong squeezing action thereby which removes the dirty water. This is allowed to run off through suitable openings and the stock travels around the mid-feather 7, comes in contact with fresh water and passes through the beater again.

* * *

Treating Cellulose Pulp Liquors

When vegetable matters are boiled with alkali to produce cellulose pulp a "black liquor" is obtained and the object is to recover the organic acids and alkali metal compounds that are found in it. The liquor is treated with oxalic or acetic acid or a salt of these acids to flocculate the coarser particles of impurities which are present in the black liquor and which are hence removed in this manner. The separated material is treated with oxalic acid to liberate the fatty substances which are dissolved out and recovered by means of alcohol, carbon tetrachloride or trichlorethylene.

The original liquor is then treated with lime or magnesia or powdered animal black to absorb most of the remaining impurities. The absorbed matter may be removed by a solvent. The original liquor is then distilled fractionally to recover volatile substances, and may then be calcined with carbon in a furnace in order to recover the soda. This process is patented in British patent No. 200,482 and is assigned to L'Alfa, Societe Anonyme pour la Fabrication des Pates de Cellulose.

* * *

Fourdrinier Paper Machine

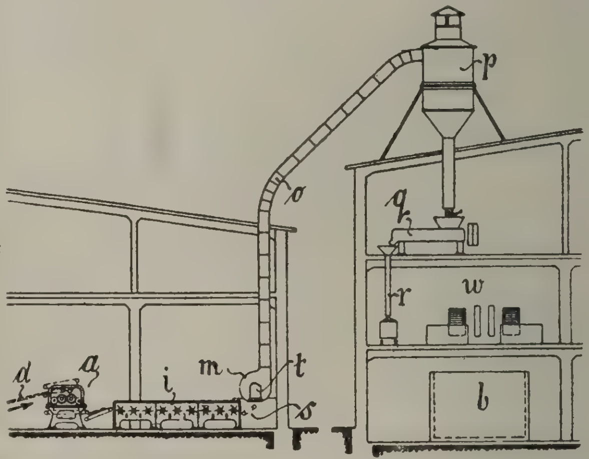
Austrian patent No. 89,164 is concerned with an improvement in the construction of the wire in Fourdrinier papermaking machines. The shaking action of the wire is carried out without oscillation of the lateral frames. This means that the weight of machine parts that are oscillated is reduced and hence the shaking action can be carried out at greater speed than in the ordinary type of Fourdrinier wire papermaking machine. This results in an increase in the production of paper from the machine and at the same time the quality of the paper is materially improved.

* * *

Reworking Old Paper

German patent No. 364,789 is concerned with a process for reworking old paper and similar waste material recovered for manufacture into paper stock. The arrangement of the apparatus is seen from the accompanying diagram.

The old paper is removed from the bins, etc., and placed on a traveling conveyor d which carries it directly to the cutting machine a. Foreign substances of large mass are removed while the waste is on the traveling conveyor. From the cutter the material passes on to another traveling conveyor, which carries it directly to a purifying machine i. This machine consists of a number of rolls, arranged one after the other and provided with flays which beat up the stock and remove all the dust from it. The object of this machine is to cleanse the stock as much as possible.



From this machine the stock is carried by a traveling belt s to a point where it is sucked up into the fan t which blows it up the tube o. The material enters at the opening t, which is closed with a screen. This can be regulated at will and similarly the distance between the traveling belt s and the suction tube t. By regulating the suction effect the heavier impurities, such as sand, bits of metal, glass, etc., that are mixed with the paper stock, are removed by simply not being carried along with the current of paper stock passing up the tube o. The stock passes into the device p which serves to remove the air and then drops directly into the machine q where it is separated into fibers. The stock can now be carried to the next lower floor of the building by means of the tube r and can be beaten in hollanders or edge runner mills, shown at w. It finally drops into the storage box b.

Construction News

Fresno, Cal.—The Independent Paper Stock Co., 3035 Butler street, has awarded a general contract to the K. E. Parker Co., Clunie building, San Francisco, for the erection of a new one-story plant on Butler avenue, to cost about $45,000. Work will be commenced at once.

Eau Claire, Wis.—The Dells Paper & Pulp Co., has commenced work on its proposed local pulp and paper mill, and plans to have the initial unit ready for service in the near future. A list of equipment has been arranged and it is expected to place orders to have the machinery available when the plant is completed sufficiently for the installation. The new mill is estimated to cost in excess of $350,000, with equipment. L. A. DeGuere, Wisconsin Rapids, Wis., is consulting engineer.

Fort William, Ont.—The Great Lakes Pulp & Paper Co., has preliminary plans in progress for the construction of a new pulp and paper mill on site selected. It will consist of a number of buildings, with power house, machine shop and other mechanical structures, and is estimated to cost more than $2,000,000, with equipment.

St. Joseph, Mich.—The Mid-West Box Co., 111 West Washington street, Chicago, Ill., manufacturer of fiber board products, has acquired the local mill of the Mullen Brothers Paper Co., taking over the interest of Francis Huges, who acquired the property at a receiver's sale a number of months ago. The new owner will occupy the mill at once, and plans to develop an extensive capacity. Necessary improvements will be made in equipment. W. H. Fairchild is president of the purchasing company.

Rockingham, N. C.—In connection with the proposed new local mill of the Rockingham Paper Co., lately formed with a capital of $75,000, the company has perfected arrangements with the Economy Cone & Tube Co., a local industry, to take about 60 per cent of the initial plant output, which is expected to average from 8 to 10 tons per day. Plans are being perfected for the mill and it is expected to commence work at an early date. H. C. Wall is president.

Brampton, Ont.—The Gummed Paper Co., has preliminary plans under way for the construction of a new addition to its plant on Henderson street, estimated to cost close to $22,000. Additional equipment will be installed.

Franklin, N. H.—The International Paper Co., New York, has tentative plans under advisement for the construction of an addition to its local mill.

Nashville, Tenn.—The Nashville Paper Stock Co., 101 Church street, is perfecting plans for the erection of a new four-story building at Church and First streets, estimated to cost $45,000, and will commence work at an early date.

Fort William, Ont.—The Fort William Paper Co., has preliminary plans under advisement for the erection of a number of new mill units to practically double the present output, approximating about 200 tons of newsprint per day. The expansion is estimated to cost in excess of $2,000,000, with machinery. Additional power equipment and operating machinery will be installed.

Boston, Mass.—The M. F. Driscoll Paper Co., has tentative plans for the rebuilding of the portion of its warehouse at 205 Central street, recently destroyed by fire with loss approximating $17,000.

Chicago, Ill.—Fire, Oct. 6, damaged a portion of the works of the South Side Paper Stock Co., occupying space in the building at 5833-35 Throop street. The estimated loss has not been announced.

Midland, Ont.—The International Fibre Board Co., Canada Cement building, Montreal, Que., has tentative plans under consideration for the construction of a new plant in the vicinity of midland, where a site will be secured, it is said, at an early date, and plans placed in preparation.

Pittsfield, Mass.—The Eaton, Crane & Pike Co., has acquired the local plant of the Pittsfield Machine Tool Co., comprising a main factory building and a number of smaller structures, on a 5-acre tract of land. The plant was constructed a number of years ago and used initially for the manufacture of automobiles. The new owner purposes to use the property for extensions in its local paper mills.

Merritton, Ont.—The Garden City Paper Co., has plans in progress for the construction of an addition to its mill at St. Catharines, Ont., estimated to cost in excess of $300,000, with machinery, a list of which will be arranged at an early date.

Financial Notes

F. A. Sabbaton, Grand Mere, and F. Perry, Montreal, Que., have been appointed receivers for the Dryden Paper Co., Ltd., Toronto, Ont. The receivership, it is stated, is a friendly one and was made with the co-operation of the board of directors. It is expected that under such direction that the company can be brought soon to a profitable basis of operation, and eventually discharged from the receivership.

New Companies

Rockford, Ill.—The Flexible Fiber Products Co., 657 Race street, has been incorporated with a nominal capital of $4,000, to manufacture paper and fiber products. The incorporators are A. N. Valentine, C. A. Peterson and J. E. Broadie.

Independence, Mo.—The Independent Loose Leaf Mfg. Co., has been incorporated with a capital of $50,000, to manufacture paper specialties. The incorporators are William H. Murphy and Edmund G. Harrington, both of Independence.

New York, N. Y.—The Indian Paper Co., has been incorporated with a capital of $10,000 to manufacture and deal in paper products. The incorporators M. and D. Levy, and M. E. Stein. The company is represented by Henry Uttal, 32 Broadway, New York.

Doings in Canadian Paper Field

Anti-Embargo Sentiment Growing

Testimony Before Pulpwood Commission Shows Strong Opposition to Further Restriction

The testimony heard by the Canadian Pulpwood commission at its hearings in Nova Scotia and New Brunswick continues to be overwhelmingly against the imposition of an embargo against exports of pulp wood. Those testifying have voiced the opinions generally of settlers.

On the other hand, some of the leading pulp and paper manufacturers are just as strongly for the embargo. For example, Sir William Price, one of the most important figures in the Canadian pulp and paper industry, is out for it. He says:

"Last year to produce 1,088,205 tons of pulp, 1,405,440 cords, or 702,722,000 feet board measure, of pulp wood were consumed by 46 mills. In addition 553,836 cords, or 276,918,000 feet, board measure, were exported to the United States and about 925,360,000 feet, board measure, were used for other forest products; the whole accounting for a total wood cut of approximately 1,905,000,000 feet board measure. To this consumption must be added in the future 500,000 cords of pulp wood—an amount that practically equals the present export—to provide for new mills or paper machines now under construction.

"It is only with the most intensive protection and the strictest conservation that it will be possible to maintain this vast supply of raw material to provincial forest industries. In some districts a timber shortage is already in sight and it will be necessary for the mills operating there to purchase all the available pulpwood that is produced in the province.

"There is therefore no surplus supply for export and mills in Quebec are going to be short exactly the quantity of wood that is sold mills in the United States, unless our forest reserves are depleted in defiance of conservation. This means that they will be unable to operate at capacity and will give less employment to labor."

A number of lumbermen who have been on the stand have not been backward in declaring that they are opposed to the measure; in fact some were quite emphatic in their expressions of disapproval.

A. McColl, general-manager, maintenance division of the Nova Scotia Steel & Coal Co., recently said that an embargo would work a hardship on the small operators, particularly farmers who had timber lands. He thought the government should establish experiment forest farms on the same plan as the experimental farms.

At Halifax, F. H. Colby, representative of the S. W. Warren Paper Co., Cumberland Mills, Maine, and former commissioner of the Maine forestry department, gave an interesting outline of the conservation programme of that state. He declared his belief that Nova Scotia had the finest timber stands he had seen and with proper protection they would become a marvelous asset.

Percy W. Jost, of the Jost Co., Montreal, who are large pulpwood exporters, expressed his lack of faith in the embargo as a worth-while measure. The American paper mills were finding it to their advantage to import pulp and consequently the United States market was rather poor. The situation was such that there was now very little inducement to cut pulpwood and, with the open market cut off, conditions would become worse. Mr. Jost suggested that if conservation became absolutely necessary, the prolific use of paper could be curtailed to half the present consumption without any one suffering. The tendency of the embargo, he declared, would be to give the Canadian manufacturer a lot of cheap wood which would work to the disadvantage of the farmer and small producer.

Ruling May Increase Exports

The new ruling of the United States Treasury defining Standard newsprint has not yet affected Canadian mills appreciably, but as it is very elastic it is thought by some that it may stimulate exports of news to the Republic.

According to the ruling newsprint paper to be admitted free into the United States "is hereby defined as consisting of mechanically ground wood pulp and chemical wood pulp or sulphite containing in excess of 30% of sulphite and varying in weight not more than 10% from 32 lbs. to each 500 sheets of 24 x 26 inches."

A certain amount of halftone newsprint paper had been shipped across the line prior to this ruling and most of it weighed about 35 lbs. to the 500 sheets of the size specified, which means that it still enters the States duty free. Mills turning out paper of a heavier weight will merely reduce the weight so as to come within the scope of the ruling.

The opportunity of the Canadian mills lies in the elasticity of the ruling. It is possible to make a kind of book paper out of bleached ground wood and the small proportion of sulphite that is allowed, and it is expected that when Canadian mills begin to realize this fact a type of book paper will be produced that can enter the United States under this ruling free of duty.

Another International Pulp Mill

Elsas, Ont., will in the near future have a large kraft pulp mill which will be erected at a cost of $1,500,000 by the Continental Wood Products Co.

This organization was a few weeks ago awarded the right to cut pulpwood and timber on the area situated in the watershed of the Trout and Chapleau rivers in the district of Sudbury, comprising a territory of 1,049 square miles. The construction must be started within the next few months on the new mill and before June, 1924, $500,000 must be expended. The capacity of the mill must be 75 tons a day and 100 persons must be employed.

The company, which is a subsidiary to the International Paper Co., is a concern which is doing things and may be relied upon to carry out faithfully and efficiently its agreement with the Department of Lands and Forests of Ontario in the erection of the kraft pulp mill. It has built 20 cottages at Elsas while others are in course of erection, together with a school and clubhouse. The cottages are finished with beaver board and hardwood flooring consisting of two bedrooms, sitting-room, dining room, kitchen, pantry and toilet with a large covered verandah in front.

Fire broke out recently in the plant of the Lennox Paper Mills, Camden East, Ont. The blaze, which started in the stock room, was noticed by girls during the noon hour and the fire call was given. The workmen formed a brigade and were successful in stopping the spread of the flames. The stock room, two office buildings and a large boarding house were destroyed. The plant was recently taken over by a new company and had started operations. It is understood that production will in no way be interfered with.

Employes' Benefit Association

At the recent annual meeting of the Employes Benefit association of the Consolidated mill, Wisconsin Rapids, Wis., the first meeting of the newly elected trustees was held, preceded by a banquet to which the old and new trustees and various mill officials sat down.

George W. Mead spoke on the benefits of the association as seen in the mill and told of the progress made since its organization in 1916.

H. A. Babcock of the Interlake company of Appleton also spoke on the progress of the local organization and that of a similar benefit association at Appleton.

At a business session of the new trustees F. W. Powers of Stevens Point was elected chairman and F. W. Drumb of Wisconsin Rapids was named superintendent of the association.

No Shortage of Labor

The Continental Wood Products Co., of Elsas, Ont., reports there is no unusual activity as regards price and demand for pulpwood in that vicinity nor has the proposed embargo made any change that is in any way apparent.

The company has three large camps working in the vicinity of Elsas getting out pulpwood and during the past month had some trouble in securing men but toward the latter end of September the labor situation improved greatly. The company has now bought all the help that it requires.

The firm considers that the shortage of labor in September was due to the majority of men in those parts going out to the harvest.

Pulpwood Prices Rising

J. B. Moncion, of Cochrane, Ont., speaking of the pulpwood situation in that district, said that sap-peeled wood is about 10 percent higher than last year and the price for rough wood will also be higher this fall from 10 to 15 percent. The threatened embargo does not seem to have made any change in the general situation around Cochrane and no American buyers have covered this ground, so far as he knows, buying up any larger quantities than usual.

Mr. Moncion says that the cut will not be as large this coming winter around Cochrane as last year owing to construction work like the extension of the T. & N. O. to Tin Can Portage and the waterpower development at Mileage 42 north. Wages will be higher than last year and labor is scarce.

Promotions at Crane Mills

The Crane mills at Dalton, Mass., have appointed three superintendents at the Pioneer mill, one being in charge of each of the eight-hour shifts. They are T. O. Johnson, who has been acting superintendent for several months; Henry Stowell, beater engineer of the mill, and John Anthony, formerly foreman of the linen department at the Government mill.

Mr. Stowell is succeeded as beater engineer by Walter Grew, who has been a beater engineer and who in turn is succeeded by Timothy Morrison of the Government mill. Mr. Morrison is succeeded by Roy Belcher.

The market for ground wood pulp at the present time is quite active and nearly all mills in Canada who can take advantage of present prices are doing so. As high as $45 per ton is being obtained, f. o. b. mill. The recent rise in prices was caused by low water conditions on the other side of the line resulting in a number of grinders being shut down.

The Lyons Paper Co. at 1459 Tremont street, Boston, has been purchased by Charles A. Coombs, who will continue the business under the same name.

Operations of Porcupine Company

The Porcupine Pulp & Lumber Co., Limited, has been operating at Hoyle, Ont. for the past six years. The head office of the company is at Niagara Falls, N. Y., and the president is E. E. Mansfield, of Niagara Falls.

The Porcupine organization takes out an average of 8,000 cords a year and this season let contracts for about 11,000 cords of 4 feet wide. The wood is cut by contractors from lands either owned by the company or upon which it has cutting rights. The company has rights upon some 8,000 acres. M. E. Crouch, who is an Ontario land surveyor and formerly resided in Port Arthur and Nipigon, Ont., has been appointed manager of the company.

Hoyle is on the T. & N. O. railway, 16 miles south of Timmins. The Porcupine Company owns 39 acres at Hoyle upon which are mill buildings, etc. A subsidiary concern, the Porcupine River Improvement Co., Limited, operates a dam on the Porcupine river at the mill and has certain driving rights on the stream under the Provincial act governing such companies. The wood is either hauled direct to the mill or driven down the Porcupine river to the rossing plant.

The company does not operate any camps but gives contracts to outsiders for all wood. The mill of the company rosses on an average of about 125 cords in ten hours. For the past two months men have been at work placing concrete piers under the mill, erecting a new conveyor and making other changes and improvements.

Straw Pulp Mill in Manitoba

A straw pulp mill will be erected in Western Canada and the initial unit will turn out 50 tons of pulp daily. Sir Frederick Becker, of London, England, when in Canada recently, looked into the possibilities of establishing such a plant in the prairie provinces. His investigations proved satisfying.

M. Dolfus, managing-director of Devains Process, Limited, of England and France, is at present in Canada arranging to go ahead with the mill. As already stated, it will have an initial capacity of 50 tons of pulp per day, which will require 150 tons of straw; a capacity which will be enlarged, before 1925, it is likely, to 100 tons a day, and more if the first mill proves satisfactory. It will cost between $1,000,000 and $1,250,000 to put up the first unit of the mill. This includes machinery and plant only. Numerous offers have been received from Western interests of free land sites. The cost of raising the capital will also have to be added. This will bring the total cost to about 35 percent less, it is stated, than the cost of constructing a wood pulp mill.

Pejepscot Company Activities

The Pejepscot company, which maintains mills in Maine, has extensive pulpwood areas in the Salmon river district of New Brunswick, which is just east of the Mispec river.

The Pejepscot company has been cutting more pulpwood during the summer and fall of this year than ever before for what is termed a summer season. Most of the wood is shipped in barges under tow to the Maine mills from the company's piers at Salmon river on the Bay of Fundy.

Preparations are now being made for enlarged operations during the winter cutting season. Indications at the otuset of last winter were that the largest cut ever made would be taken out of the Salmon river limits but the frequent and heavy snows and bitter cold militated against the success of the woods operations. In fact, the work was suspended in January, it being absolutely impossible to continue cutting. The heavy and frequent storms also marred what started out to be a record breaking winter in exportation, insofar as the company is concerned.

Protection for Dryden Creditors

The Dryden Paper Co., Limited, Dryden, Ont., which recently went into liquidation, found it necessary to do so in order to carry on woods operations during the coming winter. The finances of the company were such that the interest on first lien notes and bonds and sinking fund payment of $50,000, which were due at the first of the month, could not be met and in order to avoid foreclosure and conserve for the shareholders and creditors the large equity in the plant and property, it was decided that a receivership was the best course to pursue.

During the past three years the company has lost over $700,000, which has eliminated working capital. Until there is a change in the kraft market, it will not be possible to do any financing. Surplus assets over liabilities are $5,066,780, or slightly over $50. per share.

British Columbia Exports Increasing

The reduction in sales to Australia by British Columbia newsprint mills following the granting of a preference to British mills, in which the Canadian have had no chance to participate, has not hit the B. C. mill as hard as had been expected.

Confronted by a loss of exports totalling about 50,000 tons a year, the outlook did look rather blue, but this has been very largely made up through increased exports to the United States. There has, however, been some loss through different sized cuttings.

Exports to the Orient are also increasing, so that while for the time expansion in the coast mills has been halted, still there is little prospect of operations being curtailed. There is also a possibility that Australia may yet grant something in the way of a preference to Canadian newsprint.

Would Make Companies Responsible

George Chahoon, president of the Laurentide Company, pulp and paper manufacturers, is of the opinion that a law should be passed forcing pulp and paper and lumbering companies whose employes create forest fires to be financially responsible for the damage caused. He points out that the forest fires of the current year have been as costly as those for ten years. In one fire the Laurentide company suffered loss to the extent of about three million dollars. Of this vast loss about eighty per cent will probably be salvaged, according to the statement of the president of the concern.

Mr. Chahoon says those responsible for the origin of the fires must be compelled to realize the losses are their own as well as of the pulp and paper companies.

Paper Converters, Limited, have been granted a provincial charter with a capital stock of $50,000 and headquarters in Montreal, to carry on the business of merchants, manufacturers and dealers in paper made from any material, cardboard, etc., and to manufacture boxes, bags, paper cups, packages, etc. Among the incorporators are George Franklin Caven and John Henry Wright.

Paper Standardization

(Continued from page 17)

midity in the testing room of the laboratories, and certain tests are valueless unless conducted under uniform temperature and humidity conditions. Especially is this true with the determination of the folding endurance, probably the most important test on bonds, ledgers and writings; a most important test for indicating the flexibility and probable durability of paper. Though it is generally understood that the physical qualities of paper are affected by changes in humidity conditions, there is but little appreciation of the rapidity with which these changes affect it. Paper is so exceedingly sensitive to changes in atmospheric humidity that, in order to obtain concordant results which may be duplicated at other times and by other laboratories, it is necessary to make all physical tests upon it in a room where both uniform temperature and relative humidity are maintained.

List of Tests and Determinations

The following is a list of tests and determinations to be made with corresponding characteristics which each test helps to determine:

1. Microscopical examination to determine fiber composition and show the presence of injurious fibers.
2. Tearing resistance, folding endurance, tensile strength, bursting strength, to determine quality of material used and care in handling during process of manufacture.
3. Weight per ream, to determine compliance with contract specification.
4. Thickness, to determine bulk.
5. Expansion and absorption, to determine resistance to changes due to moisture.
6. Percent of ash, to determine kind and amount of leading material.
7. Percent of sizing, to determine kind and amount of sizing materials used.
8. Fastness to sunlight, to determine permanency of color.

The United States Testing Company was recently appointed official chemist to the United Typothetae of America in regard to paper. Besides the testing of samples of paper for the members, this laboratory is now at work for the Typothetae, establishing a set of standards for tests which shall mark the "zone" limitations in paper qualities. It is their purpose to be able to define in terms of tests exactly what is the first grade, second grade, etc., in each of the different kinds of paper and to furnish their membership with the grading of the mill brand paper according to these standards. This laboratory wil do for them the technical work connected with the establishing of the grades, the defining of the grades before technical committees and associations, and the grading of paper to rate them within the grades. It is their object to have one set of standards by which they will judge paper, so that the manufacturer might know exactly what tests his paper is going to meet, and the members of the Typothetae shall know what they are talking about in discussing paper qualities.

Combine Forestry and Agriculture

The teaching of forestry in a separate department at Penn State college will be dropped under the new policy by which Governor Pinchot has caused the concentration of all forestry teaching at Mont Alto.

Teaching of forestry at Penn State will hereafter be continued as an agricultural course, as farm forestry. The course will be handled by John B. Ferguson, formerly in charge of the department.

Paper and Board

New York, October 23—Most branches of the paper industry are characterized by considerable activity though in some quarters there is much room for improvement. Demand on the whole is good. Consumers are placing orders in consistent fashion but are noticeably averse to absorbing other than supplies directly and actually required, stocks being kept at an unusually low level, with the result mills are called on to produce merely enough paper to cover current consuming requirements. The price tone is steady, only in exceptional cases is there any sign of easiness in quotations, and in a majority of instances the tendency is in a higher direction.

With the close of the year not so far off, many in the trade are commencing to speculate on the probabilities of a revision in newsprint prices for 1924. Present indications are that no change will be made in print paper quotations for the first half of next year since the smaller manfacturing companies have begun to let contracts at $75 a ton, or 3.75 cents a pound, the price that has held all through this year, as against $70 in 1922 and the peak price of $130 reached two years ago. The International Paper Company, which generally sets the price in the domestic market, has taken no formal action as yet, but it is reported that Canadian manufacturers are planning to keep the present rate in force, and American companies are not expected to do otherwise.

An official of the International Paper Company is quoted as saying regarding prices: "The International Paper Company has contracts for practically all the paper it can make next year. In view of higher wages, freight and raw material costs, newsprint prices should be fractionally higher next year. Whether they will be or not is another matter." It will be recollected that before the I. P. announced no change in price for the last half of this year expectations were general that the price would be raised.

There has been no indication from Canada that any upward revision is contemplated. Opinion in the trade is that American companies would be unable to maintain a higher price for their product than their Canadian competitors, especially in view of the rapidly growing production in the Dominion.

Consumption of newsprint continues heavy. New York newspapers are printing issues of record size and are omitting many columns of advertisements, showing that they are unable to carry all the advertising offered them and that they could profitably publish larger issues if they had the necessary facilities and paper. The same appears to hold true for all the large cities thoughout the country.

There is a gradual expansion of demand for book paper. Mills are slowly but surely increasing their production and this branch of the industry is exhibiting more and more life and a firmer price situation. Some mills are shading prices but such is the exception, and as orders increase there is less tendency to grant price concessions.

Fine papers are fairly active. Mills in Holyoke are getting back in running order since the strike of stationary firemen was settled by arbitration, and demand for bonds and ledgers is showing improvement. Prices are firm and the strong position of raw material is a factor lending strength to the market.

Manufacturers of box boards promptly advanced prices when the strike of paper box factory workers in New York City was

settled early last week. Quotations on plain chip and news board were moved back to $60 a ton delivered New York from a level of $55 to which they sunk during the strike. A flurry of buying of boards accompanied the termination of the strike, and board mills in the East are busier than they have been in some weeks. The situation in board in the Middle West is healthy and active, manufacturers there encountering a relatively better demand than those in the East and operating their machines on a larger scale. Offerings of chip and news board on the Paper Industries Exchange in New York have been freely made at $60 delivered New York, while strawboard has been offered at $50 f. o. b. Middle Western mills.

Coarse papers are moving in a routine way at steady quotations.

Mechanical Pulp

A steady demand continues for mechanical pulp and the market for this commodity is of broad enough proportions to easily absorb all of the supply offered by producers and dealers. In fact, there is an excess of demand, if anything, since a good many grinders who ordinarily have a part of their output to direct to the open market are still on the lookout for pulp against their own requirements. Prices are firm, with Canadian producers securing up to $50 per ton at pulp mills for spruce ground wood, and domestic producers $40 and higher, the difference in prices being largely a matter of moisture in the pulp concerned and the consequent higher freight rates on domestic ground wood. Water conditions are bad in most grinding districts though some slight improvement is reported in certain sections.

Foreign and Domestic Chemical Pulp

Demand for chemical wood pulp fails to show much expansion. Papermakers are buying in a most reserved manner, few evince any interest in other than supplies they have direct need of, and yet it is stated that the aggregate movement toward consumers is very nearly up to normal dimensions, if not fully normal. There is a sagging trend to prices of most pulps, however. Foreign kraft has been offered down to 2.90 cents a pound ex dock New York, and bleached soda pulp was offered on the Paper Industries Exchange in New York at 3.75 cents a pound delivered Middle West paper mill points. Sulphite is in fair movement with consumers purchasing unbleached in relatively better tonnage than bleached. Importers quote strong

Domestic Rags

The higher qualities of papermaking rags rule firm and are meeting with what is regarded as fair demand, but the poorer grades have sagged in price to some extent owing to a slackening of demand from consuming quarters. Roofing stock has eased off between $1 and $2 a ton, and is now quoted at 1.45 to 1.50 cents per pound for No. 1 and 1.25 cents for No. 2 packing f. o. b. New York. New cuttings are wanted in a consistent way by mills though in rather small lots. Dealers are reported asking 13 cents and higher per pound for No. 1 white shirt cuttings, 5.25 cents for washables and 11.50 cents for unbleached muslin cuttings, but these rags can probably be secured at slightly under these prices. Old whites are in a firm quotable position and are fetching the figures sellers quote. Thirds and blues also are firm. F. o. b. New York quotations are:

New Shirt Cuttings,			
No. 1	12.50	@	13.00
No. 2	6.25	@	6.75
Fancy Shirt Cuttings	6.00	@	6.25

Thirds and Blues, repacked	2.90	@	3.10
3rds & Blues, misc.	3.40	@	3.60
Black Cotton Stockings	3.25	@	3.50
Roofing Rags No. 1	1.45	@	1.50
Roofing Rags No. 2	1.25	@	1.30

Imported Rags

Importers say that most grades of foreign papermaking rags are enjoying a moderately good demand but consumers are asserted to be bidding prices which do not always meet with the approval of sellers. Dark colored cottons are bringing 1.50 cents a pound on the dock New York and probably a shade higher in some instances. Blues are steady in price and marked by fair demand. Linens, old linens especially, are inquired for. Quotations on ex dock New York basis follow:

Lins., White, No. 1	12.00	@	13.00
Ger. Blue Cottons..	2.50	@	2.75
French Light Blues.	2.75	@	3.00
New Light Prints .	5.50	@	5.75
New Unbleached ...	9.50	@	9.75
German Linen, blue.	4.00	@	4.50
German Linen, grey.	6.00	@	6.50
German S. P. F.'s.	6.00	@	9.00
German Light Prints	2.50	@	2.75
Dk. Colored Cottons	1.50	@	1.60

Bagging, Rope, Etc.

A decided strengthening of prices on old rope has occurred and quotations are on a higher level than has prevailed in some time. Dealers in New York quoted 5.75 cents or more f. o. b. this city for domestic No. 1 manila rope, and imported manila rope has been sold at 5.50 cents ex dock at this port. It is declared that available stocks of old rope are abnormally small,

Wochenblatt
Fuer
Papierfabrikation
Biberach-Riss (Wurttemberg)

Oldest trade journal of the paper industry, circulating among all paper, card board, tissue and woodpulp mills.

Official organ of all the leading technical societies and trade associations.

Extensive and successful advertising department, buying and selling, employment, etc.

Annual subscription price to any address **$4.00**
Advertising rates: Two cents a column line of space a millimeter high and fifty millimeters wide.

CURRENT MARKETS—Continued

and dealers are making use of this as an argument for higher prices, especially since paper mills evince more buying interest. Old bagging is quiet and prices are nominal, buyers being able to get supplies at almost their own rates. Quotations f. o. b. New York are:

Gunny, No. 1	1.25	@	1.35
Foreign	1.20	@	1.30
Wool Tares, heavy	1.50	@	1.75
Scrap Bagg. No. 1	1.15	@	1.25

For. Manila Rope	5.50	@	5.75
Domestic Rope	5.75	@	6.00
Mixed Strings	1.25	@	1.50

Old Paper

The price tendency in waste paper is downward and nearly all grades are on slightly lower quotable levels than a week ago. Whether the operation of the Paper Industries Exchange in New York had anything to do with the softening of values or not is problamatical, but it is quite apparent that the opening of the Exchange unsettled the tone of the market locally. Folded newspapers have sold on the Exchange at 1.05 cents a pound f. o. b. New York, which is about the current market price on this grade of stock, while No. 1 mixed paper has sold at 80 to 85 cents a hundred pounds f. o. b. New York. Much higher prices than these prevail in the Middle West on these grades, according to transactions on the Exchange here and in Chicago. Shavings are slightly off in price to 4 cents a pound for No. 1 hard white and 3.15 cents for No. 1 soft white f. o. b. New York, and flat magazines are down to 1.85 at 1.95 cents f. o. b. this city. Old kraft paper is steady at around 2.25 cents per pound New York, and so is ledger stock at 2.10 cents. Quotations f. o. b. New York follow:

No. 1 Hard White Shavings	4.00	@	4.15
No. 2 Hard White Shavings	3.25	@	3.50

Folded News	1.05	@	1.10
No. 1 Mixed Papers	.80	@	.85

Twines

Some slight improvement in demand is reported for certain descriptions of cordage but business generally is nothing more than routine and prices show little change. Raw materials are strengthening and this may eventually lead to higher quotations on finished cordage. Quotations are:

Sisal Hay, pure	13.25	@	14.25
Manila Hay, pure	16.25	@	17.25
Sisal Lath Yarn	12.25	@	13.25

No. 6	19.50	@	
American Light India—No. 7	18.50	@	

Chemicals

Demand for casein continues fair and prices quoted on this article range from 14.50 cents a pound upward. Bleaching powder is firm at 1.50 to 1.60 cents per pound, while soda ash is quotably maintained at between 1.45 and 1.50 cents a pound. Papermaking chemicals in general are in moderate call.

ORR FELTS
and JACKETS

Lowest Cost per Ton

If you judge felt values, not by what you put into the equipment, but what you get out of it—then you will specify ORR 3 stripe Endless Felts for ORR felts will produce the lowest cost per ton. They "stand up" under severe usage. Orr durability is acknowledged everywhere. Their strength and long life are as dependable as their reliability and quality.

In the 32 grades of Felts and Jackets we can match your most exacting demands. Tell us the kind of paper you desire to make, and we will send you samples of felts that will economically serve you and help you to produce paper at lowest cost per ton.

THE PICKLES DRYING REGULATOR

Reasons why you should have it on your machine are: First, it regulates the drying of paper automatically, irregularities are eliminated; second, higher machine finished papers are attainable, because it is possible to maintain the proper quantity of moisture in sheet, as it passes to calenders; third, mills having tried it on one machine have ordered it for all their machines. Full particulars upon application to

Manufacture of Pulp and Paper

IN FIVE VOLUMES

Being prepared by the Joint Committee on
Vocational Education of the Pulp and Paper Industry
Volumes I, II and III now issued.

Volumes IV and V are expected during the year.

The work is adapted to the classroom, to home study and for use as a reference work. Every firm and individual connected with the industry or interested in the pulp and paper business should own one of these sets.

The volumes issued are on sale at $5 a volume and orders may be placed with the Technical Association of the Pulp and Paper Industry, 18 East Forty-first Street, New York or with Hughes Publishing Co., Inc., Suite 418, 1478 Broadway, New York.

Grinding Temperature of Woodpulp

Determination of the Strength of Mechanical Pulp—Testing by Making Into Paper—Results Show that Elevated Grinding Temperature Improves Quality of Pulp

(Concluded from last week.)

WHILE it is generally possible to determine the strength of a textile fiber by direct examination, this cannot usually be done with pulp for the reason that the pulp fiber is too short and too irregular. Hence, in order to determine the strength of any particular grade of half stuff or pulp, it is first necessary to make a paper sheet from the fiber and test the same. It is, of course, understandable that the strength determined in this fashion is not exactly indicative of the actual resistance of the fiber, for the paper sheet may be variably resistant to mechanical stress dependent on the ease with which the fibers felt together to form a firm sheet of paper and on other conditions as well which vary with the method by which the paper is made.

The microscopic examination of the pulp fibers showed that the structure of the mechanical wood pulp fiber may vary considerably. It therefore stands to reason that a direct determination of the strength of these fibers is impossible and would only lead to incorrect conclusions.

A crude method of establishing the mechanical resistance of the fibers has often been applied to the sheet of paper board that is formed on the dehydrating machine. The feel of this board and the behavior of the same when being torn were used as indicators of the strength possessed by the pulp fiber. But these tests are dependent to a large extent on the personal equation of the tester. Furthermore, the sheets of board formed in this manner vary considerably with the method used in making them. Thus one essential condition would be that all the boards being tested be made on the same dehydrating machine under conditions which are maintained as invariable as possible. When this is done it is possible to arrive at some conception of the strength of the board and of the pulp from which it is manufactured and it becomes possible to compare different boards with one another or with a standard board according to the composition of the same. But even under these conditions it is risky matter to form a definite conclusion regarding the relative value of one kind of pulp in contrast with another from the result obtained by this method of testing.

The best way in which to determine the strength of half stuff is to make it into paper and test the sheet. The raw materials that are to be compared must be made into paper on a machine under exactly similar conditions if an equitable comparison is to be possible. The result obtained in this manner can be directly applied to the original raw materials. There is, of course, one drawback to this method of testing and that is that it is generally inconvenient for many reasons to make the paper on a machine. This requires a quantity of pulp and is costly and, furthermore, a machine is not always available for the purpose.

The only other alternative is to scoop the stock out of the pulp chest and make it into paper by hand. There has been considerable investigation of this method of testing half stuff and of the way in which conditions can be regulated so that a paper sample can be prepared from each lot of raw materials that can be equitably compared with the next one.

The test was made in the following manner: A form 10 by 18 centimeters was employed in making the paper sample. This form was covered with a piece of regular paper machine wire. It is advisable to use a fine wire for the reason that when a large wire is employed irregularities are produced in the sheet of paper. The frame of this form was provided a close fitting cover. The stock chest was a large vessel, with a capacity of approximately 15 liters. This vessel contained 12 liters of the stock mixture at a dilution of one to 500. The paper web was removed from the wire to a sheet of dry cellulose board and then pressed in a regular copying press. As no drying cylinders were available, the paper samples were hung in chambers to dry in air.

Although this method of drying the web afforded the advantage of the possibility of testing paper which had not been subjected to special calendering or heating and hence in which certain factors which had some bearing on the results were excluded, nevertheless it had the great disadvantage that it prevented the fibers of the paper from becoming united into a smooth sheet but an undulating or wavy sheet was obtained. This made it impossible to arrive at an exact determination of the degree of stretching to which the paper sheet was subjected when under a certain tension. For this reason it was found advisable to dry the paper sheet on a flat iron which was heated electrically. The sheet of paper was accordingly dried in this way between sheets of blotting paper.

Before a sample of pulp was taken from the stock chest the material in the vessel was stirred up very thoroughly but at the same time care was taken to see that no waves were formed which could influence the deposition of the pulp on the experimental wire frame. In this manner a characteristic sample of pulp was obtained on the wire. Great care must be taken in taking the sample. (Exact details of the procedure which must be closely followed in order to obtain samples of paper under like conditions in all the testing are given in the original article but are omitted from this translation for want of space.—Translator.)

The finished sheets of paper were 10 by 18 centimeters. Strips 18 centimeters in length might be cut from the testing purposes, but these would not be long enough for testing in the regular form of tester. The Schopper rapid tester was used, in whnch the distance between testing points was 50 millimeters, and strips ten millimeters wide were cut from the sheet of paper for testing with that instrument. It is claimed that in this manner a more characteristic sample may be obtained for irregularities may occur in larger samples.

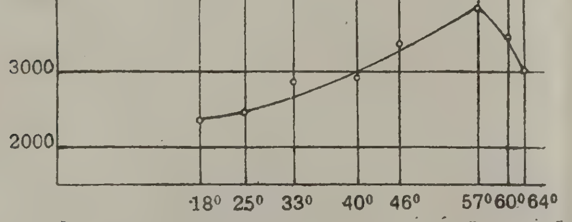
In making samples for testing, the sheet was cut both lengthwise and in transverse direction, so that the testing could be carried out with and across the grain. When the paper was made on the machine quite different results were obtained when testing samples in both directions, but when the paper was made by hand in the manner described above, there did not seem to be any appreciable difference between the results. From seven to ten samples of each grade of paper were tested. The strength determinations were made in air possessing a relative humidity of 61 percent.

Results of the Experiments

The following tabulation shows the results of experiments made to determine what effect the temperature at which the wood was converted into mechanical pulp had on the strength of paper manufactured from the pulp.

Grinding Temperature degrees C	Tearing length meters	Stretch Percent
18	2395	2.3
25	2478	2.4
33	2887	2.3
40	2928	2.3
46	3372	2.5
57	3856	2.8
60	3483	2.9
64	3002	2.6

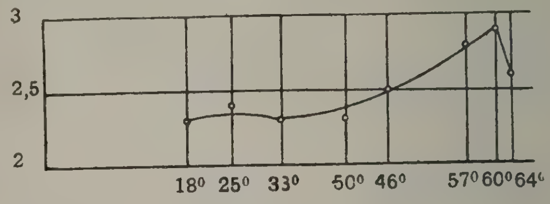
The values given in the tabulation above are plotted in the form of curves which are given below.



Influence of grinding temperature on tearing length

When these curves are studied a little intensively, it is seen that the tearing length increases with the grinding temperature. However at a temperature of 57 degrees C, the curve seems to reach a maximum value and as the grinding temperature is further increased, the tearing length decreases.

As has been learned from the micro-photographs which were described in a former article, at this temperature the individual fibers start to become isolated in the mass of pulp and at still higher grinding temperatures, which is brought about by reducing the quantnty of spray water, a quantity of hydrated slimy stuff is formed which cannot be completely washed off the stone by the spray water. Hence, at higher temperatures the stock appears to be "dead ground." From this it may be concluded that a temperature of 57 degrees C is most favorable for the production of mechanical wood pulp.



Influence of grinding temperature on stretch

The same conclusion may be reached with respect to the percentage of stretch that is induced in the sample of paper. This increases as the grinding temperature increases until a maximum is attained at a grinding temperature of 60 degrees C. Then as the grinding temperature is further increased, the percentage of elongation or stretch decreases.

These tests permit the investigator to see for himself how advantageous it is to grind the wood at elevated temperatures. A much higher grade product is obtained without increasing the consumption of power.

Rosin and Fat Content of the Pulp

The presence of rosin in the pulp causes strong foaming of the stock and hence considerable trouble at the doctors on the paper machine. It also has the effect of causing the formation of spots on the paper web and tends to stop up the wire. Furthermore, the paper is caused to stick to the presses and cylinders and rosin spots are generally found in the finished paper under these conditions.

The question as to the exact cause of these difficulties, whether they are brought about by the rosin or the fat content in the pulp, has received considerable attention. Tests have been made in which rosin and fatty substances were added directly to the paper stock. From these experiments it has been concluded that when the rosin is free from fatty substances no spots are formed on the paper, but the color of the paper is darker. On the other hand, the presence of fat alone in the stock caused spots in the finished paper which were hardly recognizable owing to their light color. When both rosin and fatty substances were present in the paper, then the spots were very apparent. The theory is that the fat causes the precipitation of the dark colored rosin with the result that the spots, which are barely visible when just fats are found in the stock, become very distinct.

The importance of this matter was apparent and it was hence of interest to determine how the rosin and fat content of the mechanical wood pulp was affected by varying the temperature at which the grinding was carried out. The quantity of rosin present in the wood was determined by extraction in a Soxhlet apparatus with organic solvents. After the solvent was evaporated the residual matter was weighed and calculated in percentage on the weight of the original sample.

In making the analysis air dried wood was used. This necessitated the drying of the sample of moist wood pulp taken from the grinders. In drying the temperature was not allowed to rise beyond 30 to 35 degrees C, as it was found that quite different values for the rosin content of the pulp were found when the samples were dried at comparatively high temperatures than when the method was carried out at low temperatures. The extraction lasted six hours and the residue was dried to constant weight at a temperature of 90 degrees C. The following tabulation gives the average results that were obtained with various grades of mechanical wood pulp when analyzed as above:

Grinding temperature	Ether Extract Percent	Alcohol Extract Percent	Total weight of extracts percent
18	0.66	0.32	0.98
25	0.58	0.34	0.92
33	0.78	0.36	1.14
40	0.53	0.28	0.81
46	0.62	0.19	0.81
57	0.73	0.31	1.04
60	0.53	0.34	0.87
64	0.61	0.23	0.84

Discussion of Results

It is clear upon examination of these figures that the grinding temperature has no effect on the percentage of rosin and fat in the pulp. It may be expected that the wood ground at the higher temperature will contain more fats and rosin than that ground at lower temperatures, for the reason that the higher temperatures cause the separation of the fatty substances out of the woody fiber in such form as to fix the particles of rosin. The comparatively small amount of spray water used is not sufficient to wash this material away. However, there does not appear to be any well established law or rule according to which this process takes place and there is really no reason to believe that the temperature of grinding has any effect one way or the other on the amount of rosin and fatty substance found in the mechanical wood pulp.

The following general conclusions may be drawn from this series of experiments.

The grinding of wood at elevated temperatures improves the quality of the mechanical pulp without involving an increased consumption of power. It appears that a temperature of 57 degrees C is the maximum temperature that should be used with a stock concentration of 1:20.8. The photo-micrographs show that the action of the temperature is to promote the formation of isolated fibers and of hydrated substance in the pulp. Furthermore, the mechanical resistance of the fibers is increased by the rise in grinding temperature.

The tearing length of a hand-made paper increases from 2359 meters, when the mechanical pulp is ground at 18 degrees C, to 3856 meters for mechanical pulp ground at 57 degrees C, but decreases again to 3002 meters for pulp ground at 64 degrees C.

This points clearly to the final conclusion, which can be reached from these investigations, namely, that the best temperature at which to conduct the grinding process is 57 degrees C.

Profit from Sulphite Waste Liquor

Sulphur Dioxide Removed by Aerating or Passing Through Steam, Liquor Evaporated and Fermented and then Distilled for Alcohol

By **Ralph H. McKee, Ph. D.***

Professor of Chemical Engineering, Columbia University, New York

IN the making of sulphite pulp about 50 per cent. of the wood is dissolved by the cooking liquor and discarded as waste into the river. The pulp mills in the United States are annually discharging into the watercourses of the country about 6,000,000,000 gallons of such water, each gallon carrying nearly a pound of organic material obtained from the wood. This represents an enormous volume. If 6,000,000,000 gallons had to be carried in tank cars it would require each day 600 trains, each of 35 tank cars.

The mills of Canada similarly inflict on the watercourses of that country about half as many gallons annually of the same kind of waste liquor.

It is obvious that the ideal utilization would be either one where the material was used at the pulp mill or one where its values are concentrated to a small volume before shipment and which at the same time left no injurious material to be dumped into rivers or streams. The proposal which follows ships only 1 per cent. of the volume and uses the remainder at the pulp mill.

The sulphite waste liquor has been shown to be beyond question decidedly injurious to the fish and plant life of rivers and streams as well as to the use of the water for civic supplies. In some cases States or cities have compelled the closing down of sulphite pulp mills because of the objectionable character of this waste liquor. Indeed a number of State legislatures have passed laws, which, if enforced, would stop the emptying of this sewerage of the sulphite pulp mills in water courses. Congress also has taken steps in the same direction.

From this it is evident that there is a real need for a method which will utilize these large quantities of sulphite waste liquor. There are several mills with sulphite waste liquor utilization plants but these altogether use only about 1 percent of the sulphite waste liquor of the country. These plants make alcohol, tanning extract, adhesives (road binders and core binders), and other materials in still smaller amounts. Moreover the alcohol plant discharges its residual slop into the river, so in this case the nuisance is only decreased, not eliminated.

I wish to present for your consideration a two-phase process which can be used to obviate the running of waste sulphite liquor into the watercourses and which in addition permits considerable profit to be earned on the investment. In the development of the first step of the complete process, I had an active hand. The second phase has been in use in a few European mills for several years.†

---

* *Read before the American section of Societe de Chemie Industrielle, October 12, 1923.*

The first phase is to ferment and distill off the alcohol. The second is to evaporate the residue to 50 percent solids and use it as fuel for steam making.

About a fourth of the 10 percent of solid material present in the sulphite waste liquor is a fermentable sugar. In times past mills have neutralized this sulphite waste liquor with lime, and fermented it after filtering and the addition of yeast foods. The alcohol obtained on distillation is of ordinary commercial quality. There are some twenty-seven European and one American mills which have alcohol plants of this type. The yields of alcohol by this old process are generally considerably lower than would correspond to the sugar content of the sulphite waste liquor used. The explanation of the low yield commonly given is that it is due to the effect, in the neutralization step, of a local excess of lime on the sugar, it being well known that fermentable sugars are readily destroyed by alkalies.

New Alcohol Process

The new fermentation process which has been developed in the chemical engineering laboratories of Columbia university is based on the discovery that, contrary to common belief, sulphur dioxide and sulphites are not poisonous to the yeast organism. That these do prevent the growth of the yeast organism in many liquids is true; but we have evidence that this is due to the fact that they are reducing agents and use up the dissolved oxygen in the liquor rather than that they have any direct action on the yeast organism. If we are right in this conclusion then by keeping oxygen dissolved in the liquor by bubbling oxygen or air through the sulphite liquor we should be able to carry on fermentation. This was found to be true experimentally.

An outline of the method of operation follows. The hot waste sulphite liquor draining off from the woodpulp in the digester blowpit is run into a desulphurizing column about 16 feet high, where it meets a counter current of steam and has the larger part of its sulphur dioxide removed. The sulphur dioxide recovered in this way is taken to the absorption towers to be used in the manufacture of fresh cooking acid.

The hot desulphurized liquor is next evaporated to approximately half its value, preferably in a thermocompressor type of evaporator. The choice of this type of evaporator is determined by the fact that the sulphite waste liquor shows a colloid character and accordingly boils, even when partially concentrated, at approximately 100°C. This makes evaporation of such a material cheap and requires but a small installation expense. The liquor as it comes from the desulphurizing tower may be fermented without evaporation, but this is not wise from a financial point of view, for to do so means doubling the capacity of the fermentation tanks and the building containing them.

The hot liquor is next cooled counter-currently with water. The warm water thus produced has decided advantages over cold water in the pulp mill for the washing of pulp. The sulphite waste liquor at about 29°C. is run into fermentation tanks and hydrolyzed yeast, ammonium sulphate and calcium acid phosphate added as yeast foods along with the yeast. The slight air current serves the double purpose of furnishing the required oxygen needed by the yeast, and of keeping the yeast mixed with all portions of the fermenting liquor.

After fermentation the alcohol is distilled best in a continuous still, to give a crude alcohol, and this crude alcohol is then re-distilled in a discontinuous or batch still. On to one of the upper plates of the distillation column there is run a dilute alkali to neutralize the free sulphur dioxide which accompanies the alcohol during distillation.

I have carried out fermentations using samples of sulphite liquor from some fifteen mills. The yields of 95 percent alcohol vary between 0.55 percent and 1.35 per cent, with an average of nearly 1 percent, calculated from the volume of sulphite waste liquor.

Cost of Producing Alcohol

Using the data obtained at the plant of the Hammermill Paper company, Erie, Pa., in fermentation and distillation of charges of 13,000 gallons of sulphite waste liquor, I give herewith the costs of producing alcohol for a 100-ton sulphite pulp mill. The percentage of alcohol used is 1 percent, though the percentage obtained in the experimental work, using the 13,000 gallon charges mentioned, was 1.07 percent.

A—PLANT

Total cost per gallon	26.17c

Utilization of Residue as Fuel

By making use of the advances made in evaporator design in the last few years in this country, and of the experience of Swedish and German mills in burning concentrated sulphite liquor, it appears that utilization for fuel of the residual sulphite liquor after fermentation offers an excellent means of disposing of this nuisance material and at the same time making a real profit on the investment.

When this residual sulphite liquor after fermentation is evaporated we have the residue showing an average heat value, on a dry basis, of 7,950 B. T. U. per pound with an ash of 13.9 percent. For each ton of pulp there is obtained about 9,900 pounds liquor after fermentation, containing 14 percent solids, *i. e.* 1,386 pounds solids. To concentrate to 50 percent solids will require the removal of 7,128 pounds water, with formation of a mobile pitch of 50 percent solids weighing 2,772 pounds.

B.T.U. developed by burning 1,386 lb. of fuel of 7,950 B.T.U.	11,018,100
B.T.U. required to drive off 1,386 lb. of water: 127,512 and 1,344,420 B.T.U. (raising temperature and vaporizing)	1,471,932
Theoretically available B.T.U.	9,546,168

This is equivalent to 682 pounds coal, 14,000 B.T.U. per ton of pulp made, or 34.1 short tons coal per day for a 100 ton pulp mill.

If this sulphite pitch is burned under a boiler to give steam of 150 lb. gauge pressure, there will be obtained a boiler efficiency varying between 60 and 80 percent, according to the design of the boiler and its firebox.

We may use the steam generated for the development of power in non-condensing steam engines and the exhaust steam of such engines can be used to evaporate the liquor in multiple effect evaporators. On the basis of this system we have the following: A simple non-condensing Corliss engine, using steam of 150 lb. pressure, has a steam consumption of about 35 lb. per indicated horse power. The steam exhaust from this type of engine is at a pressure of 3 to 5 lb. per square inch, and is about 88 percent dry. Assume that owing to pipe condensation and other heat losses it delivers but 75 percent of the theory to the evaporators.

I shall not weary you by going through the calculations but it can be easily shown that such an engine will, in addition to giving power for plant use give more than enough exhaust steam to supply the triple effect evaporator needed to concentrate the residual slop from the still to a mobile fuel of 50 percent solids.

If the boiler shows a fuel efficiency of 60 percent then for

(*Continued on page 21*)

Swedish Pulp and Paper Exports

THE production and export of Swedish paper and pulp during the first six months of 1923, in spite of the prolonged labor difficulties, reached quantities exceeding by a considerable margin those for the corresponding period of last year, and comparing well even with so-called normal pre-war years, reports Acting Commercial Attache' H. Sorensen of Copenhagen to the Department of Commerce under the date of September 7. The present position of the industry is, on the whole quite favorable, especially when compared with the position of other Sweedish industries.

The cellulose market, while still quiet, is showing signs of improvement under the stimulus of a considerable number of inquiries and the prospect for an increased demand from Great Britain during the fall months. There is, according to experts, a general feeling that the sulphite market has now passed its dead season and that steady improvement in demand may be expected. Reliable estimates place that part of the Swedish sulphite which was unsold at the beginning of September at only 20 per cent of the year's total production.

The demand for mechanical wood pulp according to latest advices, is moderately lively, and sticks in continental and English markets are said to be rather low, one estimate placing them at only two-thirds of normal. Latest quotations for wet wood pulp for this year's delivery are £5 10s. per ton, c. i. f.; and for dry wood pulp 170 crowns per ton, f. o. b. Goteborg.

Present cellulose prices, per ton, c. i. f. British ports or Amsterdam, are as follows: Bleached sulphite, £20 21s.; easy bleaching, £16 16s. 15 d.; and strong, £15 15s. 15d. In general the tendency in prices seems to be firm or slightly rising.

The Swedish paper production and export have also (since the settlement of the labor conflict) reached a level comparing favorably with last years', and are much above the 1923 level.

Swedish exports of wood pulp, paper, and cardboard during the first six months of the current year are given in the following statistical table. To permit the formation of an opinion regarding the entire northern European exports, there are also included statistical data showing exports of paper and pulp during the same period, from Norway and Finland. All the figures are based upon official statistical data made available by the Swedish Board of Trade.

	Sweden		Norway		Finland	
Items	1922	1923	1922	1923	1922	1923
Woodpulp:	Tons.	Tons.	Tons.	Tons.	Tons.	Tons
Mechanical ...	75,900	77,200	178,600	262,100	19,900	23,000
Chemical	210,100	221,500	95,800	122,600	83,500	103,100
Paper	99,700	127,400	97,200	110,800	94,300	88,000
Cardboard	8,100	13,400	2,100	5,100	10,500	12,300

Swedish exports of paper and pulp during July of the current year totaled 28,900 tons of mechanical wood pulp, 79,000 tons of chemical wood pulp, 2,119 tons of cardboard, 12,408 tons 2of newsprint, and 11,650 tons of miscellaneous classes of paper, against 23,800 tons of mechanical wood pulp, 76,265 tons of chemical wood pulp, 1,719 tons of cardboard, 10,752 tons of newsprint, and 10,438 tons of other classes of paper during July, 1922. As will be noted, the figures for July of this year show a substantial increase in exports of all classes of pulp and paper over July, 1922.

Australian Woods for Papermaking

THE desirability of establishing a pulp and paper industry in Australia has led to a further and more comprehensive study of many Australian woods hitherto regarded as unsuitable for papermaking. The soda process was used throughout, and encouraging laboratory experiments were repeated on a semi-commercial scale. An abstract of a report by L. R. Benjamin in Bulletin 25 of the Australian Institute of Science and Industry covering the experiments is given in *Jour. Soc. Chem. Inst.*, Sept. 28, 1923, p. 923 A.)

By using comparatively weak liquors, *e. g.*, 30% of caustic soda (on the dry weight of chips) at a concentration of approximately 44 grams per liter, and moderate cooking pressures, *e.g.*, 100 ℔. per sq. in., for about six hours, many varieties of immature eucalypts are capable of yielding 41 to 48% (bone-dry pulp on bone-dry wood) of screened pulp requiring 10 to 16% of bleach.

The digester used in the commercial trials was fitted with an external liquor-heater and a circulating pump to avoid excessive dilution of the cooking liquor, which would result from the use of live steam for maintaining the cooking pressure.

The Victorian eucalypts, "mountain ash" (*E. regnans*), "woollybutt" (*E. delegatensis*) and "silvertop" (*E. sieberiana*), and the Tasmanian varieties, "swamp gum" (*E. regnans*), "gum-top" (*E. delegatensis*), and "stringy bark" (*E. obliqua*) are the easiest woods to prepare and give a high yield (47 to 48%) of easy-bleaching pulp. "Karri" (*E. diversicolor*), "marri" (*E. calophylla*), and "blackbutt" (*E. pilularis*) give rather lower yields (46.9%, 43.5%, and 43.2% respectively) of pulp with a higher bleach consumption (14 to 16%), but, being denser woods, show higher yields when ℔. of pulp per cord of wood is taken as the basis.

All these woods give over 30% more pulp per cord than does poplar or spruce, and can be cut and transported all the year round.

Papermaking tests, using a 750-℔. beater, show that the bleached pulp, though short-fibred, hydrates well, and if beaten carefully for about four and a half hours, avoiding excessive cutting, and relying on a moderate brushing action, using dull knives, can be used in admixture with sulphite pulp in the production of high-grade printings, etc.

Papers containing 60 to 65% of eucalypt pulp possess good opacity, should be capable of taking a high finish, and are as strong as or stronger than similar papers containing 90% of sulphite pulp. There is less shrinkage during the drying of papers containing much eucalypt pulp than is experienced with sulphite stock beaten to the same degree of wetness and fineness.

The total estimated cost of producing bleached soda pulp from immature "karri" is £12 14s. per ton for a mill having an output of 10 tons per 24 hrs.; with a higher output this figure could be probably reduced to £10 to £11 per ton. In view of this and the enormous quantities of wood available in the form of re-growth resulting from saw-milling operations, notably in Victoria and Tasmania, it should be possible to establish a pulp industry capable not only of supplying home requirements but also of building up an export trade.

The suitability of immature eucalypts as a source of mechanical pulp has not as yet been fully investigated, but, with imported newsprint at £22 per ton, it appears probable that, under favorable conditions, if made on a large scale, newsprint containing chemical pulp alone, including 20 to 30% of imported newsgrade sulphite pulp, could be profitably made for home consumption.

Meeting of Box and Label Men

Affiliation with the United States Chamber of Commerce was unanimously decided upon at the annual convention of the National Label Manufacturers' association, which adjourned October 19 folowing a three-day meeting at Kalamazoo, Mich., held jointly with the Folding Box Manufacturers' association of America.

The label manufacturers paid a compliment to John F. Byrne, president of the folding box association, by adopting as its code of ethics a document similar to that recently adopted by the box manufacturers. Br. Byrne, president of the box manufacturers and of the Standard Paper company of Kalamazoo, also is the author of the code of ethics.

At the convention of the label manufacturers it was stated that the plants of the association now are operating on a 70 to 75 per cent capacity and that the outlook for an increase in business volume next year is excellent.

Executive Secretary Dickie reported to the two conventions that the delegates to the folding box meeting represented plants with a capitalization of $80,000,000 and that the delegates to the label convention represented mills with a capitalization of more than $40,000,000.

Thursday afternoon was given over to entertainment features, beginning with the luncheon at the cafeteria of the Standard Paper company at noon and closing with the dinner at the community house of the Kalamazoo Vegetable Parchment company in the evening. In the afternoon the delegates and their wives were taken on a trip of inspection through the chief mills of the Kalamazoo valley.

Addresses were made at the evening meeting by Charles S. Campbell, of Kalamazoo, on "The Fallacy of Selling Below Cost"; Jacob Kindleberger, of Kalamazoo, on "The Harmony Club"; and Julian Armstrong, of Chicago on "The Paper Industries Exchange". An industrial film on paper making also was shown.

President Biermans of the Belgo-Canadian Co. returned recently from a trip to Europe. While in Belgium he is understood to have cleaned up the final details for the transfer of the company to Canadian interests.

Nepco Installs New Improvements

New Alexander Mill the Best Equipped Yankee Mill in Existence—Is a Wasteless Mill in the True Sense of the Word—Construction and Installation in Record Time

THE starting of the second Yankee machine at the Nekoosa mill of the Nekoosa Edwards Paper company on Friday, October 5, 1923, practically finishes one of the most extensive construction programs since the consolidation of the John Edwards Manufacturing company, then owning what is now known as the John Edwards paper mill operating two paper machines; the Port Edwards Fibre Co., owning what is now known as the Port Edwards sulphite mill with three 14 foot by 42 foot digesters; and the Nekoosa Paper company, owning what is known as the Nekoosa paper mill then operating four paper machines, all of which by consolidation in June, 1908, became the property of the present Nekoosa Edwards Paper company with main offices at Port Edwards, Wisconsin, and subsidiary offices at Nekoosa, Wis. and Chicago, Illinois.

The money was appropriated in December, 1922, when the board of directors voted to build a new two machine mill at Port Edwards, Wis., this mill to be what is known as the "Alexander mill." It was decided to build two new Yankee machines, to erect one in the Alexander mill, move one of the Nekoosa machines to Port Edwards and to erect the other Yankee in its place at Nekoosa.

The following program was carried out:

(1) The erection of the new building known as "Alexander mill".
(2) The erection of one of the new Yankee machines in the new mill.
(3) The shutting down of the Worlds Fair Machine at Nekoosa and moving to Port Edwards.
(4) The erection of the second Yankee at Nekoosa.

On December 15, 1922, the contract for the two new Yankees was signed with the Beloit Iron Works of Beloit, Wisconsin, and the contract for the building was signed with the C. R. Meyers Construction Co. of Oshkosh, Wisconsin, on March 10, 1923.

The paper was first put over the new Yankee at Port Edwards on July 24, 1923, just seven months after the order was placed for the machine and four months after the ground was broken for the building and is, as far as we know, a record for this class of work.

This machine is the second 12 foot dryer machine to be built by Beloit Iron Works, the first being the "Dryden machine." This machine is a 132 inch Fourdrinier, with a 12 foot dryer and many other special features; it trims 126 inches.

The Alexander Mill

The Alexander mill is 156 feet wide by 185 feet long and the entire building is of reinforced concrete construction and with the exception of the wood sash it is fire-proof.

The machine and beater room is 70 feet wide by 135 feet long and is 24 feet clear to the trusses. The roof is steel truss with 5 inch gypsum slab on steel purlins over which is Johns Manville standard "A & A" roofing. Lupton skylights and Swarthout ventilators were used. The machines, beaters and Jordons are all in one room. The basement is 13 feet high and is free from all machinery except pumps and stock tanks.

Adjoining the machine room on the dry end is the finishing and storage room, which is 61 feet wide and 135 feet long, containing basement and two stories. Two elevators take care of the handling of paper and pulp. The finishing room is on the main floor and is finished in white enamel and gray wainscot. Floors throughout are painted with Koverfloor paint. Machines are finished in Royal Red enamel and all pipe is painted to standard code. Paints were furnished by Detroit Graphite Co., and A. G. Adams Co.

Adjoining the finishing room is a covered car shed for shipping, all under one roof, capable of handling eight 40 foot cars at one time.

Equipment

The beaters are 2000 pounds capacity Niagara type furnished by the Valley Iron Works of Appleton, Wisconsin, but the filling installed by Nekoosa Edwards Paper company is "Youngchild filling" which is doing such good work in the Nekoosa mill, where it was developed. The granite bed plates were

Mills of Nekoosa-Edwards Paper Company at Port Edwards, Wis.

No. 1—John Edwards mill in background at left. In the center is the new Alexander mill, containing machine and beater room, finishing and paper storage room, shipping room and car loading shed. Loading shed of sulphite mill on right, also garage which houses four trucks.

No. 2—Alexander mill during construction period.

No. 3—Groundwood mill at left with stacker. Paper mill in Center. Alexander mill was erected directly behind standpipe. Office at right.

No. 4—Groundwood mill at left. John Edwards mill is directly back of smoke stack. Alexander mill in center back of standpipe. Sulphite mill at right.

No. 5—In foreground is space in which Alexander mill was erected.

(*Continued from page* 9)

furnished by the Green Bay Foundry and Machine Co. These beaters are driven by 150 HP General Electric motors through Link-Belt silent chains.

The Jordons are the Appleton Machine Co. No. 1 Jordons and are direct connected to General Electric 150 HP, 450 RPM motors.

The stock pumps furnished by Beloit Iron Works are 8 inch by 18 inch duplex and these are gear driven by G. E. motors.

Centrifugal water pumps and stock pumps in this mill were furnished by the Dayton-Dowd Co. of Quincy, Illinois. There are five of these pumps in 3 inch and 6 inch sizes handling water and stock.

The vacuum pumps for both the wire and felt are Nash Engineering Co. pumps furnished by Thos. E. Savery, Jr. A No. 2 pump is used on the felt and a No. 4 pump on the wire suction boxes, both being direct connected to G. E. motors.

The Murray Iron Works of Wausau, Wisconsin, furnished the direct connected motor driven agitators with which the stuff chests are equipped.

The hood over the machine was furnished by Wolff & Bero Co. and the Briner economizer with which it is equipped was furnished by J. E. Ross Engineering Corp., of Chicago.

The screen is a No. 2 Bird furnished by Thos. E. Savery, Jr.

All of the drives for this machine are on the main floor. The Yankee drive is by a 110 HP 900-3600 RPM variable speed Kerr turbine designed for 40 pound back pressure. The machine is direct connected through leather belt without line shaft or core gears. Less than half the shafting and bearings usually required are included in this drive. Pulmax belt tighteners are used.

The cutters supplied by the Hamblet Machine Co. are 124 inch special extra heavy type with 12 roll backstand.

The Maxson Automatic Machinery Co. supplied a 134 inch by 45 inch duplex, six pile, automatic Erie lay boy.

The rewinders were furnished by Cameron Machine Co. and are Universal type 42 inch and 84 inch.

There is a crane running the full length of the machine room, furnished by H. D. Conkey & Co., Mendota, Ill.

This mill is equipped to handle deckered stock, both groundwood and sulphite being pumped in 6% consistency from groundwood and sulphite mills. This stock is pumped into large steel tanks over beaters. The triplex stock pumps were furnished by Hayton Pump and Blower Co. of Appleton, Wisconsin.

The machine is equipped with a 50 foot wire 132 inches wide, two presses, a 12 foot dryer and a 4 foot sweat dryer. There is a 5 roll stack of calenders, duplex reel and two drum winder.

The clothing was furnished by Lindsay Wire Weaving Co., F. C. Huyck & Sons Co. and Orr Felt & Blanket Co.

Wasteless Machine the Outstanding Feature

The outstanding features of the Alexander mill and the new Yankee machine therein is that it is the best equipped Yankee mill in America and is the first wasteless mill in existence, at least known to us, it being so equipped that no waste water can get into the river without first flowing over the machine room floor. There is no connection to the sewer, making this machine the nearest to wasteless yet designed and equipped. There was a time when most paper makers were of the opinion that a paper machine could not be run without a connection to the sewer but this one was so designed and works wonderfully well.

The white water at the wet end of the machine drops into a pit under the wire and into a 1000 G.P.M. pump and this returns the water needed to the mixing box by a 6 inch pipe; the balance not needed goes into a white water tank over beaters for beater supply. The overflow of this tank goes back of the machine over an inclined saveall, the stock saved going by gravity back to the machine chest, and the water going through the wire being returned to a tank in the basement for make up water to the shower pumps. The white water from wire suction boxes also goes into basement for make up water. There is no overflow from the wire pit to the sewer, but the machine tender regulates the level of the supply in the pit by regulating his white water showers.

Any stock going into pit at the couch goes back to the chest and there is no connection with the sewer from this pit. An overflow allows any surplus water to go into the pit under the wire.

If the wire pit overflows, it goes onto the floor in front of the machine and over the machine tender's feet, but if he watches his job there is no overflow and none goes to waste.

When changing colors, the machine is equipped with double chests so the beaters can be running on one color and filling one chest, while the machine is still running another color from the other chest.

The white water tank over beaters has a washout for use at color changing time and a float valve for an automatic supply of fresh water when this change is made.

Product and Speed

The product of this machine will be what is known as "machine glazed," being highly finished on one side and rough on the other.

The machine is built to run 650 feet per minute on light weight papers and has been averaging over 20 tons a day of 20 pound paper.

This machine is known officially as Nepco No. 8 machine.

The second item on the construction program was the shutting down of the Nekoosa No. 2 machine and moving it to Port Edwards.

Shortly after the new Yankee was put into operation "The World's Fair Columbian machine" which was originally exhibited in 1892 at the World's Fair in Chicago, and which has been running/at the Nekoosa mill since that time was shut down. This was done on August 5, 1923, and moved from Nekoosa to Port Edwards to make room for a Yankee duplicating No. 8 at Port Edwards. A crew of Nepco mechanics set to work and on September 5, 1923, just one month from the day it shut down at Nekoosa, it started making paper at Port Edwards. The machine was first thoroughly overhauled.

This machine is driven by a 12x12 Chandler and Taylor variable speed engine belted to an overhead lineshaft. The beaters, jordons, stock pumps, etc., described under the Yankee machine furnish the stock for it.

This is a 112 inch Fourdrinier machine and makes water finished wrappings from 30 pounds to 100 pounds of the various well known Nepco brands, the same as it made while at Nekoosa. It is known as Nepco No. 7.

The installation of these two units makes the total production of Nepco Port Edwards plant 125 tons and, with 100 tons at Nekoosa, a total of 225 tons of paper per day for both plants.

The building for the Alexander mill was designed and erected under the supervision of E. P. Gleason, chief engineer, C. F. Watson and Henry M. Ford, assistant engineers, and John E. Walley construction superintendent.

The designing of machinery as well as the systems in use were planned by B. T. McBain, director of manufacturing and his able assistants, C. A. Wiley and O. L. LeRoux.

Mr. McBain has been called "King on Waste" and this wasteless mill is his idea; 100 pounds of paper will be made from 100 pounds of stock.

The last step in the construction program was the installation of the second Yankee at the Nekoosa mill where the World's Fair machine stood. Immediately after getting the last piece of machinery out of the way work started on the foundations and the sole plates were set about September 15th. The big 12 foot dryer left Beloit on September 22 and arrived in Nekoosa and was put in the mill on September 25th. Clothing and wires were put on the machine on October 4th and the machine started off on October 5th.

This machine is a duplicate of the machine at Port Edwards. It will make specialties in Kraft paper, striped machine glazed particularly for which there has been a demand by Nepco customers for some time. This machine is known as Nekoosa No. 2.

Brings Total to Eight Machines

The addition of these two Yankee machines brings the total to 8, as follows:

Nekoosa	No. 1	Mch.	116 inch	Rice Barton & Fales	
"	No. 2	"	132 inch	Beloit Iron Works, Yankee	
"	No. 3	"	106 nich	Rice Barton & Fales	
"	No. 4	"	126 inch	Pusey & Jones	
Port Edwards	No. 5	"	108 inch	Beloit Iron Works	
" "	No. 6	"	117 inch	" " "	
Alexander	No. 7	"	112 inch	" " "	Water Finish
"	No. 8	"	132 inch	" " "	Yankee

Nepco makes its own groundwood, sulphite, sulphate and bleached pulps which enables them to always make the same quality paper.

It was not necessary to add to the pulp making equipment as pulp and chemical mills are capable of producing plenty of pulp for Nepco's own needs.

The pulp making equipment is as follows: three 14x42 foot sulphite digesters in the Port Edwards sulphite mill with a capacity of 75 tons, and ten 3 pocket grinders, eight of which are direct connected to water wheels and two are motor driven, these being in the John Edwards groundwood mill, together with a bleach plant capable of producing 50 tons bleached sulphite.

At the Nekoosa mill there are two 14x38 foot sulphite digesters with a capacity of 50 tons and two 8x37 foot sulphate digesters with a capacity of 47 tons, also three 3 pocket grinders direct connected to water wheels.

Additional Electrical Equipment

The additional electrical equipment needed by the plants to operate these paper machines include:

Two 1500 KW extraction type steam turbines which were furnished by the Westinghouse Electric and Manufacturing Co.

A third 1200 HP Allis Chalmers hydro electric unit is installed in the Nekoosa hydro plant to supply additional power.

This installation brings the total number of motors to 500, totalling 9,500 HP. The hydroelectric plant capacity is 7,500 HP and the steam electricity is 6,000 HP. This is in addition to 15,000 HP of direct connected water wheels installed in the three plants at Centralia, Port Edwards and Nekoosa.

With the increased production and business the company is installing a new private automatic exchange telephone system for use in the three plants Port Edwards, Nekoosa and Centralia as well as its offices at Port Edwards and Nekoosa.

The officers of the Nekoosa Edwards Paper company are:

L. M. Alexander, president and treasurer
Judson G. Rosebush, vice president
L. E. Nash, vice president and manager of sales
B. T. McBain, director of manufacturing and asst. gen. mgr.
C. A. Jasperson, secretary.

The directors are: L. M. Alexander, Judson G. Rosebush, L. M. Hanks, G. W. Kibby, F. J. Wood, John E. Alexander, L. E. Nash, J. B. Nash and C. A. Jasperson.

With the Tissue Paper Makers

The following appeared in recent issues of the Official Gazette of the United States patent office:

1923

Trade-Marks Published For Opposition

O. G. of September 11, 1923

Serial No. 173,508

(Design consisting of an oblong with the upper line extended and pointed in the middle and at the ends, and with the lower line rounded at the corners and pointed in the middle.)

Levey Printing Company, Indianapolis, Ind.
Published for opposition September 11, 1923
Claims use since January 1915

O. G. of September 11, 1923

Serial No. 181,742

BLUEBILL

Fisher Bros. Paper Co., Fort Wayne, Ind.
Published for opposition September 11, 1923
Claims use since January 15, 1923

Trade Mark Registrations Granted

O. G. of September 19, 1923

Registration No. 173,233 Serial No. 166,864

AUBURN

(A symmetrical scroll design of roses, with the word "Auburn" in the upper part.)

Wortendyke Mfg. Co., Richmond, Va.
Published for opposition June 19, 1923
Claims use since June 5, 1922
Registration granted September 18, 1923

O. G. of September 25, 1923

Registration No. 173,467 Serial No. 179,911

WARREN

(A symmetrical scroll design of roses, with the word "Warren" in the upper part.)

Wortendyke Mfg. Co., Richmond, Va.
Published for opposition June 19, 1923
Claims use since January 1, 1923
Registration granted September 25, 1923

The following brand names have been registered in the Toilet Paper Label Registration, bureau of the Tissue Paper Manufacturers association:

Sussex	Wortendyke Mfg. Co., Richmond, Va.
Unipaco	National Paper Products Co., San Francisco, Cal.
Wakefield	Wortendyke Mfg. Co. Richmond, Va.

Arbitration Finding in Holyoke

A finding that amounts to a compromise has been made in the wage controversy between the Stationery Firemens union and the Holyoke, Mass., paper manufacturers. The controversy was submitted to arbitration and the following award was made by Fred M. Knight of the state board of arbitration and conciliation; time and one-half for Sunday work and double time for six holidays of the year. The demand for an increase of approximately 10 per cent was negated, the wage schedule remaining the same.

By agreement of the parties the award is retroactive as of October 1st. and will continue in force for a period of three months. The following concerns are affected by the award: American Writing Paper Co., Hampshire Paper Co., Carew Paper Co., Taylor-Logan Co., Franklin Paper Co., Valley Paper Co., Parsons Paper Co., and the Newton Paper Co.

Construction in Wisconsin River Valley

Work on the new 330 foot dam of the Wausau Paper Mills company at Brokaw, Wisconsin is progressing. A crew of about 100 men are at work. The work started in April and the way things are going this should be completed early next year.

This new dam is being built below the old dam and one of the features is that the mills are kept in full operation during this construction work.

The dam will replace one that was originally built in 1881 and which was rebulit in 1899 by the Wausau Paper Mills company.

The mammoth dam and power house being built at Grandmother falls on the Wisconsin river for the Tomahawk Kraft Paper company is rapidly progressing. Power will be furnished for the mill of this company at Tomahawk which was recently purchased from the Pride Pulp and Paper company.

Concrete piers are already in place and set ready to receive 4 of the gates. The draft tubes have been set and the forms rapidly being put into place.

What has been an exceedingly quiet place has developed into one of work. A large camp for the accommodation of the workers has been built.

This is one of the most important waterpowers in Northern Wisconsin.

Tempting Offers for New Hawley Mill

Architects and engineers are working on the plans for the new plant which is to take the place of the Hawley Pulp and Paper company's mill that was destroyed by fire at Oregon City, Oregon. The new structure, together with the new unit previously planned, will require an expenditure of approximately $2,000,000.

Other cities are offering the Hawley Pulp and Paper company enticing inducements to get the new paper mill. The Seattle Washington, chamber of commerce offered the company a free site with tide water and rail connections and agreed to take a block of stock in the company. The Long-Bell Lumber company offered President Hawley a free site in the timber belt at Longview, Washington. Many Willamette valley Oregon points have made similar offers.

Mr. Hawley has given out no statement as to what he plans to do in regard to offers received from outside of Oregon City. Residents of the place expect the mill to be rebuilt there.

The Pulpwood Situation

A striking expression of opinion on the proposed Canadian pulpwood embargo is contained in a letter to the New York *Times* of October 18, the writer of which signs himself "Timber." The letter comments on articles that have been published in previous issues of the *Times* and is as follows:

While it has been frequently stated and generally assumed that an embargo on Canadian freehold pulpwood would force many American paper manufacturers to transfer their business activities across the border into Canada, careful inquiry among Eastern manufacturers who are in touch with all of their confreres fails to develop knowledge of any manufacturer contemplating such action.

In the first place, the scrapping of the tremendous investment in a paper mill, with its complicated and expensive equipment, would be economic suicide on the part of any individual or company.

In the second place, should Canada impose an embargo, American paper manufacturers could readily supply the 20 percent. of the total pulp used that is made from the freehold wood imported from Canada, by purchases of both mechanical and chemical pulp from Germany, Scandinavia and Finland, which is offered freely at the seaboard at prices even lower than pulp can be imported from Canada. Besides this, many practical substitutes for wood are now receiving a great deal of attention, and many of them would serve as excellent substitutes for at least chemical pulp made from wood.

Further, it is pointed out by a man who is well acquainted with the situation in Canada that all Crown land limits which are accessible and contiguous to adequate waterpowers are already in the hands of lessees who would not part with them. He says further, to go to the remote forests which might be utilized in the lower Gulf of the St. Lawrence on the north shore, and there to acquire timberland limits, develop the waterpower, build the mills and establish the industrial towns, would involve an extraordinarily high investment which the owners would find difficulty in financing in the face of the many enterprises now on the books.

Water Shortage Closes New Jersey Mills

The water shortage in Bergen county, New Jersey, has seriously interfered with the operations of four paper and board mills in that section, together with about three hundred other industrial plants.

The water supply of these plants was summarily cut off October 18, throwing more than 10,000 employes out of work. Announcement was made that this action was necessary in order to utilize the small supply in the reservoirs for domestic and sanitary purposes.

The paper and board mills affected were the Flintkote Co., Inc., at Little Ferry; the Bogota Paper & Board Co., the Continental Paper Co. and the Federal Paper Board Co., Inc., all of Bogota.

Will Have a Collection Department

The establishment of a collection department was decided upon by the Gummed Paper Manufacturers association at its recent meeting in New York. The success of the credit bureau established a year ago has been such that it was decided to take another step in advance by the instituting of the collection bureau.

The association spent most of its day in discussing the problem of cost accounting. How to proceed to establish a cost committee to work out a uniform method of cost accounting was discussed in detail, but definite action was left for later determination.

Will Abandon Water Power

A shortage of water is seriously hampering production of paper in the mills at Holyoke, Mass. Within the past three months the mills have been forced to suspend operations fifteen times due to the shortage of water.

Business is reported to be good, the books of the various mills of the city showing an unexpected large volume of orders.

Temporary suspension of operations it is hoped will be obviated when all the mills are equiped to be operated electrically.

New Paper Machine

A patent has been issued for a new paper machine that will take a news sheet from the wire to the first dryer automatically at all speeds and from 40 to 60% dry, with but one set of plain press rolls.

The machine is the invention of John D. Tompkins, of Valatie, N. Y., and the patent bears date of October 30, 1923.

Forestry in the Paper Industry

Conducted by J. R. Simmons, Secretary Forester,
The New York State Forestry Association

National Forest Policy

Attitude of Technical Societies Toward this Question Emphasizes Its Importance

The engineering profession is vitally interested in maintaining and increasing our supply of timber and forest products near heavy consuming centers and in the maintainance of forest protection on the watersheds of navigable streams.

The executive board of the American Engineering Council of the Federated American Engineering Societies, at its closing session in Rochester, N. Y. on Oct. 13, urged constructive co-operation between the federal government and the states. The board adopted a resolution prepared by its Reforestation committee, Chas. H. MacDowell of Chicago, embodying the following recommendations:

"That the president, the congress, and the federal budget bureau make every effort to renew yearly appropriation at the rate of $2,000,000 for the purchase of forest lands on the watersheds of navigable rivers under the Weeks law."

"That as fire prevention is so important, present appropriations should be materially increased for co-operation with the states and individuals in fighting and preventing forest fires, and in maintaining fire patrols."

Special resolutions were adopted suggesting the inauguration of new policies by states possessing timber reserves, particularly New York State, which owns large areas of forest in the Adirondack and Catskill mountains. In regard to New York the suggestion is made that the state could at any time safely put its forest problems in the keeping of trained foresters whose reputation depends on so maintaining the forests that they will become an increasingly valuable asset.

Prof. Ralph S. Hosmer of Cornell, president of the Society of American Foresters, recently gave to the U. S. Senate Committee on Reforestation a very able statement in behalf of the society on the attitude of the technical foresters throughout the country toward a national forest policy. The statement is too long to permit of a complete review in these pages, but a few of the major points may be cited. In his main argument Professor Hosmer says:

"From the data that are now before us it is the opinion of a majority of the professional foresters that only from forests within the confines of our own country can we seek for the solution of the problem of creating a permanent timber supply for the United States. What little hope there may have been in looking to the importation of timber from other countries is shattered by the conclusions reached by Messrs. Zon and Sparhawk of the forest service in their recently published book 'The Forest Resources of the World'. That comprehensive and authoritative presentation makes it absolutely clear that our vast needs for wood in its various forms can only be met from forests near at hand. When the softwoods in what remains of our original forests are exhausted, there is no other place to which we can turn, except at prohibitive cost, for more coniferous timber. The prices that would result from competition in the world markets and from transportation makes any other course impractical, if the United States is to continue to be a wood-using nation in the sense that it is today. And who of us wishes to lower the high standard of living that has come about in so large part because we had an ample supply of timber and of wood?"

"Even as regards pulpwood from Canada the situation is but little better. As regards forest resources the United States and Canada are essentially in the same boat. The forests of the Dominion of Canada are no more inexhaustible than were our own. Canadian timber will undoubtedly help us to tide over in part the period of greatest stress but, at best, this aid can be but temporary. Furthermore, the British Empire is even now making plans for the utilization of the major part of the resources of the empire within its own boundaries. But even if this were not so to attempt, by whatever means, to force a repetition in the dominion of the ill considered methods of exploitation of the forest of which we have seen all too much in this country, would be but to rock the boat. The conservation through wise use of the forests of the North American continent must be regarded as a matter of international concern. In the opinion of foresters the forests of North America form a single unit, and must be treated as such."

Professor Hosmer places special stress upon the need for management, this to be applied to all forest lands irrespective of ownership. This move, he argues, can best be made by placing emphasis upon the five things for which all those who have given this subject serious consideration are in practical accord:

1—Prevention of forest fire.

2—Just forest taxation.

3—Addition to the existing areas of publicly-owned forests.

4—Better provision for the assistance of the private forest land owner, both in aid in reforestation and in the proper management of existing woodland.

5—Increased support of forest investigation and research.

Practical Example of Reforestation

Paper is conducting, through this department, an investigation into the amount of land that is being annually reclaimed through reforestation by paper and pulp manufacturers. The data will be available at first by separate states and eventually, in so far as possible, for the entire country.

In this connection the industry will be interested in a study begun by a forester in 1914 and completed this year, on a pine plantation of 12 acres containing 5,430 trees. Fortunately for all concerned this plantation was set out in the year 1875, and was mature at time of cutting. We also have definite information to the effect that the seedlings were native-grown, dug from an old pasture, planted 8 feet by 100 feet apart, and that they received absolutely no care from the time they were planted until they were cut.

The plantation was made in Plymouth county in Massachusetts. In 1914 it was thirty-nine years old and an estimate, based on the measurement of every tree in the plantation, gave approximately 300,000 feet board measure. In 1922 the plantation was harvested. The logs were cut into four foot lengths preparatory to being sawed into box boards and the yield, checked at the mill, was 589 cords—considerably better than the 1914 estimate predicted.

Prior to planting, the land had never borne a successful agricultural crop except beans. The forest crop exclusive of the land sold in 1922 for over $5000, and the company that took it over reports a good profit on its purchase.

The only inefficient feature about the entire undertaking is that the crop was cut in one lump instead of by thinnings from time to time over a period of years. A plantation should, in so far as is practical and according to the principles of forestry, be made a perpetual proposition. But on account of the wide spacing, these trees all matured at about the same time and were never thinned. Growth practically ceased at forty years, the last ten or more annual rings being scarcely thicker than a sheet of writing paper.

This is one of the few cases where a crop of trees has been planted, grown to muturity and harvested in the United States. Our figures on the practibility of forest plantations have been based largely upon European experience. This plantation, grown on poor soil that was idle for many years, cannot fail to serve as an encouragement to American timberland owners who contemplate reforestation to increase future timber supplies and to set their idle lands to work.

Average Yield of Coniferous Plantations

If the plantation referred to above could be accepted as an accurate indication of what it is reasonable to expect from planted forests in this country, the paper and pulp industry would be in a position to draw up future plans with confidence. But one successful plantation is hardly sufficient to prove the case. The question may logically be asked, "Has America any material number of full-grown coniferous plantations on which records have been kept and estimates made?"

The answer is that she has. The same study that was applied to the twelve acre Massachusetts plantation was also applied to a dozen other plantations ranging from 35 to 60 years of age. While the figures are not based upon the actual cut at the mill, (most of the plantations are still standing) they are accurate to the extent that sample plots were carefully selected and measured for diameters and heights, and they are founded on conservative volume tables.

The total results of the investigation in terms of board measure for pine are as follows:

	Yield in board Feet Per Acre
Plantations 30 to 40 yrs. old	22 M
Plantations 40 to 50 yrs. old	33 M
Plantations 50 to 60 yrs. old	41 M

The significant fact is that these figures compare favorably with measurements made of healthy stands of native pine in the same localities. Therefore, if a piece of cutover land on which sufficient seed trees have been left so that it is reproducing itself with good coniferous seedlings is a good investment, a plantation is an equally good investment.

If these figures are taken as a basis for reforestation plans it should be borne in mind that they apply to the eastern portion of the United States and to the area known as the Northern Forest. Quite naturally, reforestation projects commenced in the section of our country first cut over, and our mature plantations are located in the east.

1,000-Acre Forest Gift

The gift of 1,000 acres of Adirondack land to the New York State College of Forestry by Charles Lathrop Pack of Lakewood, N. J. was announced by Dean Franklin Moon October 21. The property will be known as "The Charles Lathrop Pack Demonstration Forest."

Mr. Pack was for many years President of the American Forestry association and is now President of the American Tree association. The area, located on Barber Point, Cranberry Lake, has for nine years been the temporary abiding place for the Syracuse foresters. Its acquisition in perpetuity makes possible the carrying out of many plans for research to combat timber impoverishment.

The State already owns 20,000 acres adjoining Cranberry Lake. A hunting club controls 10,000 acres also adjacent to the Pack Forest, and on the inlet of Cranberry Lake is the experimental area of 1,800 acres for the New York State Ranger School, a department of the College of Forestry. Directly across from the Ranger School is a magnificent virgin stand of hemlock and white pine. Investigations of soil conditions controlling the growth of these species are already in progress in co-operation with the New York Botanical Garden. These forests will be actually combined in one big experimental area on which practically all conditions confronting the owners of forest land in the State of New York exist.

Sustained Forest Yield a Necessity

A statement recently made by Dean Franklin Moon of the New York State College of Forestry at a public hearing on reforestation is to the effect that in the pioneer stage of American development the harvesting of the forest crop was considered a nomadic industry.

Labor was cheap, construction costs far less expensive than to-day, freight rates comparatively moderate; a mill to cut 100,000 board feet per diem could be built for considerably less than $100,000 and be amortized within ten or twelve years.

Increasing cost of all kinds of labor, freight, construction materials, make mill plants far more costly. Competition is far keener, the margin of profit, owing to increased stumpage prices and higher manufacturing costs, much smaller; sawmills, and particularly high priced paper and pulp plants, can not be scrapped after a few years and villages wiped out of existance.

Forest industries must now be operated on a more secure basis and this makes sustained yield from forest areas an absoulte necessity.

Interesting Government Book

Announcement has just been made by the Department of Commerce in Washington of a new book of 368 pages entitled "Trade Association Activities".

It contains a directory of all national and international trade associations, and is the result of a searching inquiry into the workings of these agencies made jointly by the Bureau of Foreign and Domestic Commerce, the Bureau of the Census and the Bureau of Standards. Various phases of the work of trade associations have contributed to our social welfare and industrial progress. The book recounts the history of these associations. Paper manufacturing associations and forestry bodies are among the organizations listed.

Copies of the book may be obtained by application to the Superintendent of Documents, Government Printing Office, Washington, D. C. The price is fifty cents. Stamps should not be sent. The best medium when ordering is money order or coin.

Forestry a Vital Problem

Theodore Roosevelt said in 1903 that the forestry problem was in many ways the most vital internal problem before the American people. B. E. Fernow, who was the first forester this country ever had, who has been called the dean of American foresters, and who died at Toronto about a year ago, said that forests were important to the extent that "we are surrounded from the cradle to the coffin with forest products."

The seaplane is rapidly becoming an important factor for photographing and reconnaissance work done by pulp and paper companies in Canada. The Abitibi Power and Paper Co. has arranged for the use of a seaplane over its limits, work having begun in three districts around Iroquois Falls, Ont. The wood cut is expected to run about 150,000 cords this winter, another 50,000 cords being secured from settlers.

Bank Surveys Pulp Field

The United States is the largest producer of chemical pulp in the world, but its production is not sufficient to meet its requirements. The production last year was 2,038,000 tons. Practically the whole of this was consumed in the United States, and was supplemented by about 932,000 tons imported from Canada, the Scandinavian countries and Germany.

Canada ranks after the United States and Sweden as a producer of chemical pulp, with an output of 284,000 tons in 1913. Twenty per cent. of this was exported, chiefly to the United States, Japan, the United Kingdom and China. The rest was manufactured into paper by the local mills. By 1922, production of chemical pulp had increased to 690,000 tons, and Canada is regarded as the main source of the world's future supply.

During the war period, says the National Bank of Commerce in a review of the trade, Canadian exports of chemical pulp to the United States were stimulated by the exclusion from the American markets of the larger part of Scandinavian products. Since the war, although imports from Europe have grown, Canada, has retained its position as the leading foreign source of American chemical pulp.

Chemical pulp, because of its strong unbroken fibre, is the chief raw material used in the manufacturing of wrapping paper. "Manufacturers of paper in this country are now producing nearly all of the grades of wrappings made abroad prior to the war," says the review. "There is an increasing demand on the part of merchants for domestic papers on account of less delay in delivery and uniformity of quality."

"An interesting branch of the wrapping industry as well as an important and rapidly growing one is the manufacture of vegetable parchment, grease-proof and glassine papers. Vegetable parchment, a chemical product made chiefly of cotton cellulose combined with a small percentage of bleached sulphite, is a valuable food product wrapper. It is used for wrapping products to retain moisture, flavor and odor. Domestic mills are equipped to supply an immense demand. Glassine paper is composed of sulphite pulp. Its transparency and its grease-proof qualities are effected by special beating and super-calendering, and it makes a hygienic and attractive paper for food products or for packages where both protection and transparency are desired. Before the war there was only one or two manufacturers of glassine in this country. Today there are eight or more with a production of about one hundred tons a day.

"The Anonymous Market"

The market bulletin of the New York State College of Forestry at Syracuse has increased in subscriptions this year fifty per cent and over 300 per cent in the amount of material advertised. This bulletin performs the functions of an advertising medium for wood products, timber land and lumbering equipment that would find no other source of publicity. It is a want ad sheet that brings into contact all those who have lumber, land or equipment for sale with those who want to buy.

The service is free and the material is usually in such small quantities that it would not be placed in any advertising medium where expense was involved. But the totals represented are large. More than 20,000 copies of the bulletins were issued which brought a return of 1307 inquiries from various sections of the United States and Canada, the bulk coming from New York State. The "Want" items advertised included 202,350,000 feet of logs, 10,150,000 feet of lumber; the "For Sale" items included 737,535,000 feet of timber on the stump and logs; 9,200-000 feet of lumber; 57,575 cords of pulp wood; 12,850 cords of fuel wood and large quantities of car sticks, posts, piles, piling, ties, shorts, saw dust, dowels, excelsior and bark.

No names are published in the bulletin, the college acting as a sort of clearing house between parties in that inquiries arising from the circulation of the bulletin are addressed to the college and the college in turn sends them to those who are interested. The growth of this public service to the farmer and lumberman has increased to its present proportions since being established in 1915 when only four bulletins were sent out. The growing popularity of the market bulletin is proof of its usefulness.

Offers Uniform Cost System

A uniform system of cost accounting, for the manufacturers of glazed and fancy paper, has been laid out by a special committee of cost accountants representing members of the Glazed and Fancy Paper Manufacturers association, and has now been made available to all manufacturers of these grades. The cost system, representing the combined experience of the specialists in this branch of the paper industry, is not being forced upon any of the manufacturers but is offered as a model system both for those already maintaining cost departments and for those who have not as yet installed up-to-date cost methods.

It is pointed out in the introduction to the method recommended that the amount of detail involved will differ greatly in meeting the requirements of the differnt plants but a uniform method is urged upon the manufacturers in order to enable them to determine definitely the actual cost to figure properly the results of fluctuations in raw materials and changing labor conditions.

The associations so thoroughly believes in the principle of uniform cost accounting that it has offered the assistance of its committee to manufacturers wishing to install the system recommended.

A Correction

In the issue of PAPER dated October 11, in referring to the committee appointed to select a location for the new Paper Industries Exchange, it was stated that one of the committee was W. J. Alford, jr., "of the Continental Paper and Bag Mills." The name of the company should have been Continental Paper company, of Bogota, N. J. The latter has no connection with the Continental Paper and Bag Mills.

New Developments in Paper Making

Waterproof Paper Board

Waterproof paper board or box board is manufactured in accordance with United States patent No. 1,468,959 by heating finely divided Montan wax into a pulp mass of cellulose fiber. This fiber mass has been previously mixed with finely divided calcium hydroxide.

A precipitating agent is then added to throw down the mass of fillers and waterproofing agents on the pulp fiber and the pulpy mass is worked up into sheet or web.

The board may also be made in composite form, wherein the lower layer is made of felted fiber and the top layer is made of thin highly-waterproof fiber, Montan wax and a voluminous flocculent precipitate.

* * *

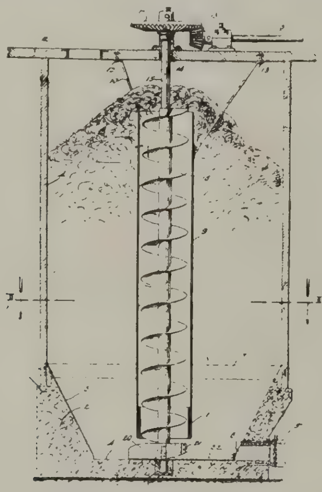
Coating Paper in a Vacuum

British patent No. 200,301 is concerned with a process for coating paper in a vacuum. The patent covers means for coating and otherwise treating paper in vacuum chambers whereby an improved product is manufactured. The main idea is the maintenance of unbroken vacuum conditions.

* * *

Pulp Bleacher

The apparatus which is shown in the accompanying diagram represents an arrangement for bleaching paper pulp according to a method described in United States patent No. 1,466,499. The apparatus consists of a tank in which there is a vertically arranged cylinder. This cylinder is suspended within the tank with its lower end at a certain distance from the floor of the tank. This cylinder is so arranged that it may be rotated and it contains a spiral conveyor or collector which rotates in conjunction with the cylinder. This conveyor collects the material from the floor of the tank and conveys it upward and discharges at the upper end while bleaching is going on.



* * *

Utilizing Old Paper

In order to recover the fibrous part of old paper the paper is suspended in a liquid and is subjected to an extremely fine mechanical action by means of rotating parts which at one and the same time work on the mass of material both in the liquid and in the solid condition. These parts also receive a forward motion so that the paper never assumes the speed of the driving, rotating members.

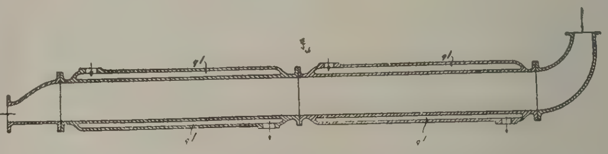
The inertia of the paper stock suspended in the liquid and the high speed of rotation of the drums on the other hand produce two forces which are opposed to each other, with the result that the paper mass is torn up into separate finely divided fibers. This results in the easy separation of the printing ink and the color from the fibrous substance. A chemical is added to the mixture in order to saponify the loosened ink with the result that it is completely removed from the paper fibers. This process is patented in Germany.

* * *

Beating or Refining Pump

It has been proposed to incorporate in the beating or refining apparatus a heat exchanger the temperature of which is controllable so that temperature of the material in the apparatus may be regulated. The heat exchanging device is usually in the form of pipes or plates inserted in the vessel or a jacket through which water can be pumped.

The present invention, which is patented in British patent No. 201,757, consists in the use of a heat exchanging device which is separated from the beating apparatus. The heat exchanger may be fluid jacket fitted to the pump employed to circulate the stock or a fluid jacket arranged partially or wholly around the pump line. The figure shows the heat exchanging device applied to a pipe line.



* * *

Controlling Paper Machines

In a paper making machine it is desirable that the speed of the various sections shall be individually variable and controllable. The purpose of British patent No. 201,235 is to afford such flexibility of control in paper making machines. Furthermore this control is exercised while the machine is in full operation.

A constant speed drive, a single speed alternating current electric motor for example, drives a fluid pressure pump connected to other minor pumps which are directly or indirectly coupled to the various parts of the machine which are to be driven at constant relative speeds. A feature of the improvement is that while each of the minor pumps is individually controllable by hand they are also automatically controlled in such a manner that, assuming the load on one of the units varies, the driving of that unit will not race or slow up.

The improvement is described as applied to a paper making machine constructed for use with oil pumped by the main pump or motor to several smaller pumps or motors, each of which is coupled to a section of the machine.

The automatic control of the several small pumps or units may be effected in various manners wherein a fluid or mechanical governor is applied to each small unit under the joint control of that unit, such as a rotating shaft, common to all the governors, for example. These governors are in balance between the unit and the shaft and will, if that balance is disturbed, alter, by means of a rack and pinion, a valve controlling the fluid pressure from the main pump to the small pump.

As an alternative for the common shaft one pump could be connected to one end of each of the cylinders and adapted to apply equal pressure on the pistons and to be used in balance with the pressure from the separate pumps driven from each unit.

Psychology of Advertising

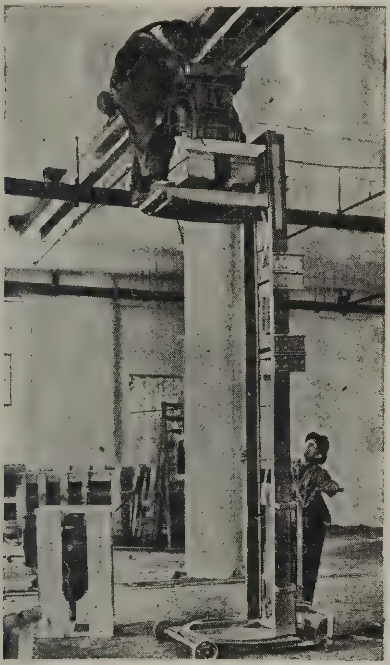
Col. B. A. Franklin, vice-president of the Strathmore Paper Co., speaking before the Publicity club of Springfield, Mass., discussed the psychology of direct mail advertising.

The money spent in advertising should be an investment he declared, and the fundamental fact to remember in preparing this kind of literature is the individual who is to receive it. He outlined three ways in which to catch the attention of the busy business man. These he said were through his love of the beautiful, his curiosity and his sense of the novel.

New Use for Well Known Device

The Revolvator, first introduced as a piece of equipment to elevate and lower bales, barrels, casks, boxes, crates and other heavy packages of merchandise has found a new field of usefulness.

A short time ago a wide-a-wake contractor saw much merit in using a Revolvator in place of scaffolding for setting heavy motors in place on ceilings. The saving in time, labor, and wood made such an impression on this contractor that he has used a Revolvator ever since for such work.



The knowledge of this new idea has spread rapidly so that today erectors, contractors and also industrial concerns are using the Revolvator for similar work. The accompanying illustration shows clearly how the Revolvator is used in this novel manner.

Two New Machinery Catalogs

The W. A. Jones Foundry & Machine company of Chicago, announces two new catalogs which will be sent to interested parties on request.

These catalogs are as follows:

Catalog No. 27—Pulleys. Is full of new and valuable information on cast iron pulleys, such as weights, illustrations, and extra lists for special types, rubber covering list; also describes, illustrates and lists "Lemley" ball bearing loose pulleys, and ring oiling loose pulleys. Steel, wood, and paper pulleys are also listed.

Catalog No. L-28—Friction Clutches. Fifty-six pages of valuable data on Lemley friction clutches, most of which is entirely new. Sleeve clutches, cut-off couplings, clutch pulleys, ball bearing clutch pulleys, gas engine clutch pulleys, are completely covered with price lists, dimensions, illustrations, horsepower ratings, etc.

Use of Glue in Coating Paper

The bureau of standards of the Department of Commerce is carrying out some experiments dealing with the use of glue in coating paper.

During the past month 9 runs have been made on the experimental coating machine, using 2 makes of bone glue for 8 of the runs and a French casein glue for one. The clay used for all runs was Lee Moor, a good grade of English coating clay.

The results indicate that the water resistance of glue-bound coating containing chrome alum compares favorably with that of casein-bound paper containing no formaldehyde. It is believed that the degree of waterproofness will prove sufficient for most of the papers used for halftone printing.

Difficulties have been experienced in obtaining a uniform coating, because of variation of the fluidity of the coating mixture and mechanical defects in the machine, so that additional work will be necessary before paper suitable for printing tests can be produced.

The International Paper Co., New York, is developing a tract of property in the vicinity of its mill at Niagara Falls, N. Y., for residential purposes for employes. Work is now in progress on a large group of houses to be sold to operatives on convenient terms. The total development will comprise about 250 homes. A contract has been awarded to the Westinghouse Electric & Mfg. Co., to equip 50 houses now nearing completion, with electric ranges.

Modern Methods

in our mills constitute one of the reasons for Appleton efficient service and fine quality.

CONSTRUCTION NEWS

Baltimore, Md.—The Paper Products Co., has awarded a contract to A. P. Lawrence, Baltimore, for the erection of a new one-story plant at 2409 Franklin street, estimated to cost $20,000. Plans have been filed and work will commence at once.

Anacortes, Wash.—The Consolidated Paper Corporation, Tacoma, Wash., has acquired local property, formerly used as a cement mill, and will convert the structure into a paper mill. Extensions and improvements will be made and the building occupied at an early date. The new works will specialize in the production of roofing papers, wrapping paper, waterproof stocks for paper boxes and kindred products. Machinery will be installed for maximum output and present operating equipment overhauled and utilized where possible. O. H. Fair is president.

Bogalusa, La.—The Union Bag & Paper Corporation, Woolworth building, New York, is reported to be planning for the construction of a new plant in the vicinity of Bogalusa, for the manufacture of its regular line of specialties. It will consist of a number of units, estimated to cost close to $500,000, including machinery.

Chicago, Ill.—The Western Bag & Paper Co., 521 West Sixty-third street, has awarded a general contract to Erickson & Christianson, 7219 Vernon avenue, for the erection of a new two-story building at Sixty-fourth street and Wentworth avenue, to be used for general operating and warehouse service. It will be 60x100 ft., and is estimated to cost approximately $43,000. H. G. Sailor, 318 West Sixty-third street, is architect.

Oregon City, Ore.—The Hawley Pulp & Paper Co., has preliminary plans under consideration for the rebuilding of the portion of its plant destroyed by fire, Oct. 9, with loss estimated in excess of $600,000, including machinery. The fire originated in the heater and machine rooms.

Dayton, Ohio—The Elam Paper Co., Marion, Ind., is having plans prepared for a new two-story plant on local site, totaling about 70,000 sq. ft. of floor space, for its proposed works in this city, recently announced. It is expected to proceed with erection and occupy the structure at the earliest date. The present plant will be removed to the new location.

Philadelphia, Pa.—G. A. Bisler, Jr., 245 North Sixth street, manufacturer of paper boxes and containers, has tentative plans under advisement for the erection of a new plant at 710-20 North Fifth street, for extensive increase in capacity.

Juneau, Alaska—C. A. Millington and K. J. Carney, Denver, Colo., engineers, are interested in a project to construct and operate a new paper mill in this section, with site on Shrimp Bay, Behm canal. The proposed plant will have an initial output of 100 tons per day. It is purposed to build a hydroelectric generating plant on Orchard Lake, with capacity of about 10,000 hp., for service at the mill. It is said that a company will be formed in Los Angeles, Cal., to carry out the project.

Nashville, Tenn.—The Nashville Paper Stock Co., Second and Church streets, has awarded a general contract to Maugaus & Bell, Murfreesboro, Tenn., for the erection of its proposed new local plant, estimated to cost about $45,000. Work will be placed in progress at once and a list of equipment arranged for installation. D. L. Ledbetter is head of the company.

Buffalo, N. Y.—The Buffalo Waste Paper Co., 98 Terrace street, is said to be perfecting plans for the construction of a new plant at 365 Babcock street. Baling machinery and other mechanical equipment will be installed.

Pittsburgh, Pa.—The Keystone Box Co., Twenty-sixth street and Liberty avenue, manufacturer of paper boxes and containers, has acquired the plant of the American Cigar Co., Twenty-eighth and Smallman streets, consisting of a six-story structure, 100x420 ft., secured for a consideration stated to be $120,000. The new owner will remodel and improve the building for a main works and will expend about $50,000 for this purpose. Additional machinery will be installed for complete operation. It is said that the present factory will be removed to the new location. Occupancy is now expected early in the coming year. Mark H. Nolan is president.

South Bend, Ind.—The La Salle Paper Co., 402 East Madison street, has awarded a general contract to Kuehn & Jordan, 725 Welber street, for the erection of its proposed new one and two-story paper mill on the St. Joe river, to consist of a number of units, with power house, estimated to cost approximately $1,000,000, with equipment. Freyermuth & Maurer, Farmers' Trust building, are architects and engineers. Claude E. Nicely is president.

Trenton, N. J.—Fire recently destroyed a portion of the plant of the Agasote Millboard Co., Fernwood, manufacturer of paper stock board, with loss estimated at close to $25,000. It is planned to rebuild.

New York, N. Y.—The Paul Bendix Paper Co., has leased space in the building at 113-19 Fourth avenue, for a local works and headquarters.

Park Falls, Wis.—The Flambeau Paper Co., has revised plans in progress for the construction of its proposed new one-story and basement plant addition, estimated to cost close to $150,000, including equipment. Brust & Phillips, 405 Broadway, Milwaukee, Wis., are architects. C. E. Perry is president.

North Tonawanda, N. Y.—The Daily News Paper Corporation, recently organized as a subsidiary of the Ontario Paper Co., Thorold, Ont., has commenced work on its proposed new local mill, on site on Little Island, lately purchased. A contract for a large dock has been awarded to S. W. Thompson, Tonawanda. The new plant will cost in excess of $500,000, with machinery, and it is expected to have the first unit ready for service during the coming year. Warren Curtis is general manager.

New Companies

Wilmington, Del.—The F. G. Leslie Paper Co., has been incorporated with a capital of $200,000, to manufacture paper products. The company is represented by the Corporation Service Co., Equitable building, Wilmington.

New York, N. Y.—Theodore Steffek, Inc., has been incorporated with a capital of $10,000, to manufacture wall paper and kindred specialties. The incorporators are T. J. Steffek and T. P. Andre. The company is represented by A. J. Wolff, 206 Broadway, New York.

San Francisco, Cal.—The Standard Paper Co. has been incorporated with a capital of $100,000, to manufacture paper products. The incorporators are George A. Connolly, C. M. Treacy and Arthur J. Harsfeld. The company is represented by Jerome Politzer, Mills building, San Francisco.

New York, N. Y.—Josephenson & Jacobson, Inc., has been incorporated with a capital of $10,000, to manufacture and deal in paper mill supplies. The incorporators are E. H. Coller, M. M. Corcoran and M. Fienkelstein. The company is represented by Coller & Coller, 277 Broadway, New York.

Profit from Waste Liquor

(*Continued from page 7*)

a 100-ton pulp mill there will be obtained 860 H.P. day and 76,300 ℔. of 3 to 5 ℔. steam, besides that used in the triple effect evaporators.

If the boiler shows a fuel efficiency of 80 percent, then for a 100-ton pulp mill there will be obtained each day 1150 H.P. and 190,000 ℔. of 3 to 5 ℔. steam besides that used by the evaporators.

The investment required to carry through this fuel economy is:

Triple effect evaporator to evaporate 30,000 lb. water an hour installed	$75,000
Boiler 1,000 H.P. installed	35,000
	$110,000
The operating expenses will be:	
Depreciation and repairs, 15%	$ 16,500
Labor 2 x 24 65c x 300 days	9,360
Yearly cost of operation	$ 25,860
With H.P. year $100 and coal $8 ton the income is as follows:	
If boiler has 60% efficiency	
860 H.P. has a year value of	$ 86,000
76,300 ℔. steam at 3 ℔.,	5,232
	91,232
Cost of operation	25,860
Yearly credit value	$ 65,372
If boiler has 80% efficiency	
1150 H.P. at $100 H.P. year	$115,000
190200 ℔. steam at 3 ℔., coal at $8 ton	13,040
	128,040
Cost of operation	25,860
Yearly credit value	$102,180

Financial Recapitulation

1.	Investment alcohol plant	$330,000
2.	Fuel evaporator & boiler plant	110,000
3.	Cost of alcohol per gallon	.2617
4	Profit at 36c sales price (excluding royalty)	56,915
5.	Value from recovered sulphite SO_2	3,000
6.	Value of hot water for washing pulp	8,000
7.	Value of power and fuel at 60% efficiency (if at 80% efficiency) $102,180)	65,372
8.	Total investment	440,000
9.	Total yearly profits and savings	125,287

The question arises whether the country can absorb without difficulty the alcohol from sulphite waste liquor. The present yearly alcohol consumption of this country varies between 75,000,000 and 100,000,000 gallons. This is excluding the war years when it reached 202,000,000 gallons in one year. An average sulphite mill will give less than 600,000 gallons alcohol if it ferments all its sulphite waste liquor, *i. e.* less than 1 percent of the country's present needs, an amount insignificant in its effect on the market price.

As to fuel—a local supply of fuel should be and would be most welcome at every pulp mill.

In conclusion I would repeat that the method of utilization which it has been a privilege to discuss before you does away with a waste that is injuring streams of the country and changes it, though at considerable capital expenditure, into useful products; one of which the pulp mill itself can use and for the other there is a large and yearly increasing commercial demand.

Short Ends from the Paper Field

The Grove Hill Paper Corporation of Rock City Falls, near Saratoga Springs, N. Y., has been charted by the secretary of state to manufacture paper, ink and yarn. The capital stock is $5,000 and the directors are Clarence K. Butler, Charles L. Hoey, and Clarence B. Kilmer of Saragota Springs. Rock City Falls was at one time the leading industrial center of Saratoga county when paper mills were operated by Chauncey Kilmer and George West.

The Zellerbeck Paper Co., of Los Angeles, Cal., is about to begin the erection of a paper mill on a 25-acre tract recently purchased in Cudahy, Cal., bounded by Santa Ana avenue, Independence avenue and Otis street. The cost of the plant is to be about $2,000,000, and the factory will be operated by the National Paper Products Co.

The Western Woodenware Co., of El Paso, Tex., has changed its name to the Western Paper & Woodenware Co., and has decreased its capital from $200,000 to $75,000.

The Paper Products Co., has let the contract for erection of a 40x50 foot addition to its paper mill in Cedartown, Ga.

The Bureau of Foreign Domestic Commerce, Washington, D. C., has received an inquiry from Goteborg, Sweden, for American paper mill machinery, designated as Opportunity No. 7876. Also, from Concepcion, Chile, for machinery for paper bag manufacture, Opportunity No. 7819. Full information available at the office noted.

The Paratz-Marr Manufacturing Co., of New Haven, Conn., has been incorporated to manufacture paper specialties. The incorporators are Edward Baratz, Bert L. Marr and Alexander Tarrantul, all of New Haven.

The Salisbury Company of Pawtucket, R. I., manufacturers of tags and paper specialties, has purchased the mill at Pawtucket formerly owned by the American Hair Cloth company and will remodel it for its paper specialties.

Low water resulted in the closing of the paper mills of Holyoke for the 11th time this fall, for an 18-hour period on October 12. Mills operating with other than water power were not affected. Owing to the low water level due to lack of rain, further curtailment is expected unless heavy rains come soon.

The Burnside tissue mills plant at East Hartford, Conn., has been sold to Thomas F. Garven of Hartford to Charles Boyland of New York City. The purchase price is understood to be approximately $125,000. It is also understood that the new owner will make extensive improvements in the plant and will operate it for the manufacture of tissue paper.

B. Parker Babbidge, 56 years, a member of the Hollingsworth & Whitney company of Boston, who had entered the employ of the company 37 years ago and had later acquired an interest in the company, died at a hospital in Brookline, Mass., September 29. His home was in Salem, Mass. He is survived by a widow.

The paper warehouse of M. F. Driscoll, between Milk and Central streets, Boston, was damaged by fire Friday night, October 5, to the extent of about $15,000, mostly to stock. The blaze started on the second floor of the six story structure and three alarms were sounded but the blaze was soon under control. All six floors were damaged. This is the second fire at the place recently, a fire about two and a half years ago badly damaging it. The building is numbered 210 Milk street and extends through to 205 Central street. The loss is covered by insurance.

One of the suggestions made by those interested in the conservation of pulpwood in Canada is that the pulp and paper companies allow the farmers as much for the pulpwood secured from that source as it would cost the companies to remove the wood from their own areas. And the further suggestion is made that the companies make as large purchases as possible from the farmers and conserve their own wood.

Charles Walmsley & Co. (Canada) held their first annual general meeting recently and it was reported that the reconstruction of the plant of the company at Longueiul, Que., was practically completed and that the manufacture of complete pulp and paper mill equipment on a large scale would be soon commenced. Sir William Price, of Quebec, is at the head of the company and all the old officers were reelected.

Michael Ludwig Jr., superintendent of the Mead Pulp & Paper company, Chillicothe, Ohio, who a few months ago was seriously ill in Mt. Carmel Hospital, at Columbus, Ohio, following his superintending the installation of a 140-inch Pusey & Jones book-paper machine in the plant of the Mead Fibre Co., Kingsport, Tenn., is now well on the road to recovery and has been about his duties at the Chillicothe mill for the past few weeks.

The Dennison Manufacturing company of Framingham, Mass., has prepared plans for the construction of bridges over Clinton street in that town to connect the various parts of its mills. It will be necessary to secure permission from the state before the work can be carried out.

The Crown-Willamette Paper company suffered a loss when a forest fire burned several hundred acres of timber and a large quantity of cordwood near their plant at West Linn, Oregon in September. Although the company had a large crew of men fighting the fire it burned from the river to the top of the ridge. The early fall rains have now lessened the danger from forest fires.

The new floor in the beater room of the Crown-Willamette Paper company mill, at Lebanon, Oregon, is practically completed.

The International Paper Co. has resumed capacity production at its mill at Glens Falls, N. Y., for the first time since last June, the plant recently having been on a three-day week basis. It is proposed to continue on a full-time schedule for an indefinite period. The company has recently placed its new hydroelectric power plant on Sherman Island, about 5 miles from Glens Falls, in operation, and will furnish service for its mills as well as supply power for distribution to the Adirondack Power & Light Corporation, Amsterdam, N. Y. The plant has a rated capacity of 37,500 kw., and is being operated on an output basis of about 25,000 hp. It has been in course of construction for about three years past.

Mill Project Went Wrong

All that remains of one of the pulp mill projects of eastern Canada is a pile of bricks.

Twenty years ago a company was formed to build and operate a pulp mill at the mouth of the Mispec river in New Brunswick. The mill was constructed on a hill overlooking the Bay of Fundy. Power was furnished by the Mispec falls nearby.

However, although the mill was opened, operations were suspended after several years, the men responsible for the organization being inexperienced, and unable to cope with the strange problems that faced them. After operations had been suspended for some time, work was resumed, and then finally discontinued. The mill was torn down, and all that remains of the industry that was predicted would build up Mispec are some wooden outbuildings. The population of Mispec has dwindled to less than a hundred.

Although located near the wood, the mill could not market the product. In the company were St. John N. B. men.

Courses at Technical School

Arrangements have been completed for the courses to be given at the new pulp and paper school which is affiliated with the Technical school in Three Rivers, Que. This result was the outcome of a conference which was held recently by representatives of the industry and the forestry service of the province.

The object in view was to arrange two systems of courses to be given in the new school and the co-operation of the advisors named by the pulp and paper association had been sought in this respect.

The first series of courses will last four years, during which the students will frequent the schools for a period of thirty-six weeks per year, following the courses and working in the pulp and paper mills eight hours per day from September to June. A fifth year will comprise special courses to specialize in pulp and paper fabrication.

To allow the men employed in pulp and paper mills to become experts in their trades, special evening courses will also be conducted.

Paper Products in Oregon

The number of paper and paper products manufacturing plants in 1921 located in the state of Oregon was nine; the number of employes was 1,799 and the payroll, as furnished the Bureau of Labor, was $2,132,560.38. The offices and location of the plants are as follows: The Crown-Willamette Paper company, Pittock Block, Portland, (plants at West Linn and Lebanon); Hawley Pulp & Paper company, Oregon City, (plants at Oregon City and Milwaukee); Oregon Pulp & Paper company, Salem, Steno Carbon Paper company, Portland, and Western Waxed Paper company, Portland. Several of the plants have been enlarged since these statistics were compiled.

Fred Webster has been appointed advertising manager of the American Writing Paper Co., which position he held three years ago. Mr. Webster is well known in paper circles, being the originator of the "Eagle A" trade mark for the American Writing Paper company and the creator of the advertising department.

The Drown Paper Goods Co. is the name of a new concern established at 18 Grafton street, Worcester, Mass., by William L. Drown of 6 Field way, Worcester, who has been connected with several leading New England paper houses for the past few years.

Stock Distribution Hinted

Kaministiquia Power Company shareholders have received the following notification: "Kaministiquia Power Company distribution of one share of Kakakbeka securities for each share of Kaministiquia stock of record 31st October".

It is thought that the distribution will probably take the form of allotting 25,000 shares of Kakakbeka Securities company to Kaministiquia shareholders with the securities company remaining separate from the power enterprise and administering the latter's interest in the paper company.

While full details of the plan are not yet known it is understood that the notice merely intimates the intention of the Kaministiquia Power company to distribute among its shareholders its substantial stock interest in the Fort William Paper Co. Limited. The latter makes newsprint, having a daily capacity of 160 tons, it being understood that it is associated closely with the Spanish River Pulp and Paper Mills.

The Kaministiquia Power Co. was organized in 1905 by Canadians, but it is believed that a strong group of English investors subsequently secured control. Sir Herbert Holt is the president.

Heavy Production of Newsprint

According to the best obtainable figures, the Canadian newsprint mills during September produced 48 per cent of all the "news" turned out in Canada and the United States, the total for the two countries being 212,695 tons. These figures are based on returns from 65 companies, 45 of which are in the United States and 20 in Canada. It will thus be seen that the average production of the Canadian mills is much greater than that of the American.

Though the total production of Canadian mills for September was less than in August, or 102,486 tons, as compared with 113,584 in August, this was due to the circumstance that during the former month there were only 24 producing days, as against 27 in the latter. The daily average, however, was 4,270 tons, as against 4,207 in August. Of the total, 99,189 tons were shipped leaving stocks on hand of 18,670 tons at the end of the month. The total production of American mills was 110,209 tons.

More Opposition to Embargo

The outstanding feature of the sessions of the Pulpwood Commission, which is now in eastern Canada investigating the necessity or non-necessity of an embargo on shipments of woodpulp to the United States, is that about eighty percent of the testimony has been against an embargo. Sessions have been held in Halifax, North Sydney, New Glasgow, Bigby, St. John, Fredericton, and with Edmundston, Bathurst, Newcastle, Campbellton, St. Stephen and Woodstock to follow.

S. E. Wardwell of the St. Croix Paper company was quoted as strongly against an embargo. His company controls about 160,000 acres of pulpwood holdings in New Brunswick. He said an embargo would shut them off from Canada and force the company to confine activities to Maine. At present the St. Croix Paper company, he stated, produces fifty four thousand tons of newsprint annually. He added that if an embargo were imposed the St. Croix Paper company would operate the mill at Woodland, Me., exactly on the international border, for about ten years, and then establish a pulp manufacturing plant in Canada. But he contended that there would be no material benefit to Canada in this. The pulp would be piped across the line to the paper mills of the company in Maine.

W. B. Wentworth, of the Penebscot Chemical Fibre company, of Old Town, Me., in testifying stated this company secures about ten thousand cords of pulpwood from New Brunswick farmers yearly. In addition the company controlled stumpage in New Brunswick, in the Pokick section, of fifty thousand dollars for five years. The company bought this stumpage on the assumption there would be no embargo.

Mr. Wentworth asserted the company had no intention of moving the plant to Canada. In the past eight years the company had expended over a million dollars for Canadian pulpwood. In addition the company had spent a half million for freight and about three hundred thousand dollars for wages and supplies for employes.

It was the plan of the company to cut about forty five thousand cords of pulpwood from the crown lands leased in New Brunswick in the five years the lease operates. The cut would be up to about three inches.

The Penobscot Chemical Fibre Company is now paying from five to six dollars per cord at the shipping point, and the wood on their own stumpage costs about five to six dollars per cord. Peeled spruce costs from fourteen to sixteen dollars per cord at the Old Town mill. Mr. Wentworth said if the embargo was imposed, the price of pulpwood in Canada would decrease substantially. And in the United States, the price would be increased owing to the keen competition. He said it would not be practicable for the company to establish a mill in Canada, as it was better to have the mill nearer the market than the wood.

In speaking of forest conservation, Mr. Wentworth stated his company was making vigorous efforts in New Brunswick to prevent forest fires. The same program for fire prevention applies to the New Brunswick holdings as to the Maine pulpwood areas from which the company cuts. In discussing the slash burning question, he said slash was beyond the danger mark after about two years.

Increasing Newsprint Production

During the current year six machines for the production of newsprint have been installed in Canadian mills as follows: St. Lawrence Paper Mills, Three Rivers, two producing 125 tons daily; Belgo-Canadian Co., Shawinigan Falls, one of 85 tons; Fort William Pulp and Paper Co., two of 120 tons; one at Bathurst, N.B., of 50 tons, or a total of 380 tons daily or 114,000 tons a year.

Two machines are planned for installation in January, 1924; one at Donnacona, 100 tons; one at Price Bros., Kenogami, 100 tons and another soon after; one at Backus-Brooks plant, Kenora, 100 tons; one of the same capacity for the Manitoba Pulp and Paper Co. These will total 500 tons, or 150,000 tons for the year.

New Record for Production

The Belgo-Canadian Paper Co. recently set up another record for one day's newsprint production when over 300 tons were turned out. This will be materially increased when the second of the two new machines being installed gets under way towards the end of November. The first of these, though rated to produce only 75 tons a day, has actually been producing up to 96 tons. Two new ground wood machines were also set in operation several weeks ago, increasing the pulp capacity of the mill by about 40 tons a day.

Paper and Board

New York, October 30—Activity of broad scope continues to be manifest in most branches of the paper industry. There are some kinds of paper for which demand has not developed in quite as heavy volume as was expected, and mills making these grades could readily accomodate considerable more business at the present time, but a large majority of paper manufacturers are busily engaged, are operating their plants at close to capacity and are encountering little or no difficulty in finding an outlet among consumers for practically all the papers they are producing.

The heavy rains over a considerable portion of the country last week came as a Godsend to paper and pulp mills. The drouth in some sections had become so severe that mills had been compelled in a great many cases either to close down or materially curtail their operations because of lack of water. For instance, three of the large box board plants in Northern New Jersey were so badly affected by low water they were almost entirely shut down for several days, while newsprint mills in New York State, in Maine and Wisconsin were reported to have been obliged to greatly curtail production. It was stated that curtailment in the production of newsprint at one time amounted to 500 tons a day in New York State alone, while an authority in the trade in close touch with the situation figured that the curtailment in the three States of New York, Maine and Wisconsin amounted to fully 1,000 tons of newsprint daily.

The heavy rains, reaching a total in excess of three inches of rainfall within two days, early in the week greatly relieved this condition, however, and latest reports are that mills have resumed more normal operations. For a time it appeared as if a serious shortage of some kinds of paper, notably newsprint, might arise, but now that mill streams are full again and production has been resumed there is apparently little or no danger of this.

Newsprint continues in a very firm market position. The curtailment of production has accentuated the market strength, and has led to a tight situation as regards immediately available supplies. Coupled with this condition at the mill end is a record-breaking consumption of print paper. Publishers in New York and throughout the country are using newsprint in tremendous tonnage, and doubtless would increase their consumption further if the paper were available. There is still a good deal of discussion in the trade concerning the probability of an advance in newsprint prices the first of the year. There are no concrete signs at the moment that manufacturers intend to raise quotations, yet an advance would not be surprising in the trade.

Demand for box boards has improved perceptibly since the ending of the strike of paper box workers in New York City. Board mills are better fixed with orders than in some time but most of them could still accomodate considerable more business. Prices are fairly well maintained. Manufacturers in the East are quoting $60 a ton delivered New York on both news and chip board though in some cases they are shading this price, reports having been heard of some sales to jobbers at $55 per ton. One of the leading mills is said to be quoting the lower price in certain instances and other manufacturers are obliged to sell at the same basis in order to compete.

Fine papers are in moderate demand. There is a steady though slow expansion of activities in this branch of the industry. Mills in the Holyoke district are gradually in-

CURRENT MARKETS—Continued

creasing their production as the demand improves, and quotations on bonds and ledgers are firm as well as they might be in view of the generally firm position of rag stock.

Book paper is moving in a steady manner and at maintained prices. Most mills quote 6.50 cents a pound f.o.b. New York or thereabouts on machine finished book, quotations ranging from a low of 6.25 cents up to beyond 7 cents on this kind of paper, depending on quality and tonnage. Coated book is quotably steady at from 8 cents per pound upward f. o. b. New York.

Wrapping papers are in fair demand and steady in price. There is a growing call for tissue and prices show a stiffening tendency. Bag papers are in an almost booming position. Demand is broad and advances in raw material have a tendency to boost prices on the finished product.

Mechanical Pulp

Improvement in water conditions has aided the statistical position of mechanical pulp, and while production has doubtless increased to some extent since mills have been enabled to speed up operations, so far as is observable there is no larger supply of ground wood in the market. In fact, indications are a shortage still exists in many districts, and consumers in a great many cases are looking to Canada to secure the bulk of their current requirements of ground wood. Most sales are in the neighborhood of $45 a ton f. o. b. pulp mill. In some instances Canadian grinders are reported getting up to $50 a ton for their pulp but the smaller percentage of moisture in Canadian ground wood reduces the delivered cost to consumers about to the same levels prevailing on domestic ground wood.

Foreign and Domestic Chemical Pulp

There is a very unsettled tone in chemical wood pulp. Demand is very unsatisfactory—from the point of view of the producer or importer—as paper manufacturers are buying in an exceedingly cautious way and almost solely against direct requirements. Moreover, there are some sellers of pulp who have stocks on hand which they are anxious to convert into money, and the fact that offerings are made at prices below recognized market levels serves to make for an upset market condition. Under the circumstances it is a difficult matter to determine what pulp values really are. Unbleached sulphite of No. 1 domestic grade is quoted at 3 cents per pound f.o.b. pulp mills but there seems little doubt that some sellers are shading this price. Similarly, bleached sulphite is quoted at

Domestic Rags

Most grades of papermaking rags are steady in price and are favored with a fair demand from consuming sources. It is apparent that mills are buying principally to cover actual needs yet there is a fair movement, and dealers say that stock is coming in from country districts in such small volume as to help to sustain values. Old white rags are particularly firm, and thirds and blues show a tendency to advance. Dealers in New York quote No. 1 repacked whites at an average price of 7.50 cents a pound f.o.b. this city, and No. 2 whites at 4.25 to 4.50 cents at shipping points, while repacked blues are quoted at 3 to 3.25 cents per pound and miscellaneous packing at around 2.50 cents f.o.b. New York. Roofing stock is bringing 1.50 cents a pound and higher for No. 1 packing, and 1.30 cents f.o.b. this city for No. 2 stock. There is not much demand for new rags though prices are quotably maintained. F.o.b. New York quotations are:

Imported Rags

Occasional sales of dark colored cottons to felt paper mills at about 1.45 to 1.50 cents a pound ex dock New York are reported, and other descriptions of foreign rags are wanted by mills in moderate amounts. Blue cottons are selling rather freely, and a steady call prevails for linens. No changes of consequence are reported in quoted prices, which, on an ex dock New York basis, are as follows:

Lins., White No. 1	12.00	@	13.00
Ger. Blue Cottons..	2.75	@	3.00
French Light Blue.	3.00	@	3.25

German Light Prints	2.50	@	2.75
Dk. Colored Cottons	1.45	@	1.50

Bagging, Ropes, Etc.

Old manila rope is characterized by market conditions bordering onto a boom. Demand is active, and dealers contend they are unable to locate all the supply inquired for by mills, with the result prices have scored further advancement. No. 1 domestic manila rope has sold at 6.25 cents per pound f.o.b. New York, and this is about the minimum price dealers will now entertain, with some asking 6.50 cents. Foreign rope has

FRANKFOLD
ENAMEL

gives your direct advertising the final touch of impressiveness. Clearly and convincingly both message and illustration are carried to the prospects' attention, with all the original freshness you have embodied into it.

FRANKFOLD ENAMEL with its extra long fibre filler prevents cracking when folded, and its blue white, smoothly coated surface takes impressions faithfully from finely screened haftones.

We will gladly forward some printed specimens or blank sheets for dummy purposes.

THE FRANKLIN
COATED PAPER COMPANY
Franklin, Ohio
Eastern Sales Office:
110 E. 42nd Street New York City

CURRENT MARKETS—Continued

sold at 6 cents a pound and higher ex dock at this port. Old bagging is quiet and rather nominal in price. Quotations f.o.b. New York are:

Gunny, No. 1	1.30	@	1.40
Foreign	1.20	@	1.30
Wool Tares, light ..	1.30	@	1.40

Domestic Rope	6.25	@	6.50
Mixed Strings	1.00	@	1.25

Old Paper

To say that the old paper market is characterized by a tone of uncertainity is describing the situation somewhat mildly. As a matter of fact, prices are very irregular, and it is problematical what actual market levels really are. The establishment of the Paper Industries Exchange in New York has upset the market to such an extent that dealers are puzzled what to quote, and added to this factor is that of a very poor demand from mills. Old folded newspapers, which are about the firmest grade in the market owing to board manufacturers concentrating their buying on this particular stock, are selling at 1.05 to 1.10 cents per pound f.o.b. New York. No. 1 mixed paper is neglected and can be readily bought at 80 cents a hundred pounds New York, and probably for less. Magazines are in slow movement and are quoted at 1.80 to 1.90 cents per pound New York, while very little activity is noted in shavings, with offerings of No. 1 hard white shavings recorded at 3.90 cents a pound and of No. 1 soft white shavings at 3 cents f.o.b. New York. Ledger stock is steady at about 2.10 cents or a trifle less, and old kraft paper is firm at 2.15 cents per pound New York. Quotations f.o.b. this city are:

No. 1 Hard White Shavings	3.90	@	4.00
No. 2 Hard White Shavings	3.40	@	3.60
No. 1 Soft White Shavings	3.00	@	3.15

No. 1 Mixed Papers	.75	@	.80
White Blank News.	2.25	@	2.35
Common Paper	.40	@	.45

Twines

Twines are moving in a routine manner and in rather limited amounts. Consumers show little interest in other than supplies immediately required, but prices are quotably maintained and an advancing trend in raw material is likely to be reflected in the finished product shortly. Quotations follow:

Sisal Hay, pure ...	12.25	@	13.25
Manila Hay, pure..	16.25	@	17.25
Sisal Lath Yarn ...	11.25	@	12.25

American Light India—			
No. 6	14.50	@	
No. 7	13.50	@	

Chemicals

The papermaking chemicals market displays no feature of note. There is a fair movement of most chemicals at maintained prices. Casein is reported showing a little easier tendency owing to increased imports from the Argentine.

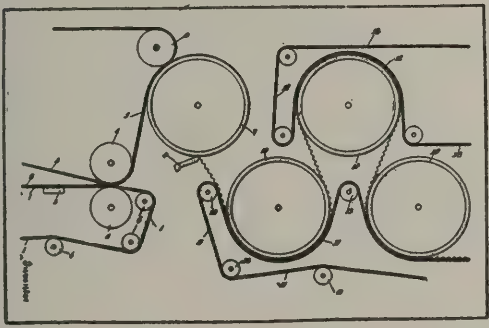
Improved Process of Creping Paper

The Best and Most Profitable

For the manufacture of CREPED PAPER Napkins, Toweling or Stretchable Bag Papers and Creped Packing or Crepe Wrapping Papers the system has no equal



The crepe being formed while the fibres are steaming hot and pliable is dried without stretching; not only retaining form better, but shedding less lint than cold creped paper products.

For particulars address:

Tompkins-Hawley-Fuller Co.
VALATIE, N. Y., or OREGON CITY, ORE.

Hamilton Board Felts

OUR style No. 82 top felt and style No. 87 bottom felt have the bulk of the filling threads on the face of the fabric. This style of weave causes the felts to give a smoother finish and longer service than can be secured from plain weave board felts, besides shedding the water better. They do not "roll on the edge" and are billed at the same list and pound prices as are our plain board felts.

ORR FELTS and JACKETS

Lowest Cost per Ton

If you judge felt values, not by what you put into the equipment, but what you get out of it—then you will specify ORR 3 stripe Endless Felts for ORR felts will produce the lowest cost per ton. They "stand up" under severe usage. Orr durability is acknowledged everywhere. Their strength and long life are as dependable as their reliability and quality.

In the 32 grades of Felts and Jackets we can match your most exacting demands. Tell us the kind of paper you desire to make, and we will send you samples of felts that will economically serve you and help you to produce paper at lowest cost per ton.

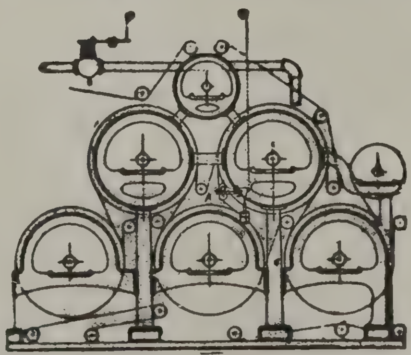
THE PICKLES DRYING REGULATOR



Reasons why you should have it on your machine are: First, it regulates the drying of paper automatically, irregularities are eliminated; second, higher machine finished papers are attainable, because it is possible to maintain the proper quantity of moisture in sheet, as it passes to calenders; third, mills having tried it on one machine have ordered it for all their machines. Full particulars upon application to

Dyeing and Tinting of Paper*

Dyestuff Absorption Experiments Described by Noted British Authority on Chemistry of Cellulose Fibers—More Attention to Paper Dyeing Necessary to Establish Standard

By **Julius Huebner, M. Sc.**

A SUPERFICIAL comparison of the methods employed in the dyeing of paper pulp with those employed in the dyeing of cotton or linen textiles does make the former seem simple and crude, because in order to obtain satisfactory results in dyeing textiles a careful purification and preparation of the material has, as a rule, to precede the dyeing, whilst in dyeing ordinary shades on paper pulp many dyestuffs can be readily applied without such special preparation.

This does, however, not apply to the production of shades on paper pulp which have to possess special properties, such as fastness to light, to the atmosphere, to water, etc.

The dyeing of such shades requires a thorough knowledge of the properties of the dyestuffs used, of the behavior of the different fibers towards the dyestuffs and of the effect of mordants, loading materials and sizing.

Table I. (Cotton).

	Time of immersion in hours	Original fibres	1.5 hours' beating	3 hours' beating	4.5 hours' beating	6 hours' beating
Average length of fiber in mm.		20.0	2.5	1.5	1.1	0.7
Percentage of night blue absorbed	1	14.5	52.2	56.9	58.4	62.3
	6	24.5	58.9	59.2	59.2	62.3
	18	27.6	59.2	59.2	60.1	62.3
	72	32.2	60.7	63.5	64.7	65.3

The conditions which affect the results in dyeing paper pulp are much more varied than those met with in dyeing textile materials, because, as a rule, a greater variety of fibers has to be taken into consideration, and frequently more complicated fiber mixtures have to be dealt with.

It is, therefore, impossible to draw a direct comparison between the dyeing of fibers, such as cotton or linen, in the entire or original state, or when spun into yarn or woven into fabrics, with the dyeing of these fibers when converted into paper pulp. In the latter case, the point to which the fibers are disintegrated in the beating operation influences both the amount of dyestuff absorbed and the rapidity with which it is absorbed to a very marked degree.

In order to ascertain this effect, carefully purified cotton yarn, spun from American cotton, was beaten for 1.5, 3, 4.5 and 6 hours respectively.

The weight of fibers used for each of the absorption experiments corresponds to 20 grms. of absolutely dry fiber. In each case the material was immersed in 900 c.c. of water, containing 0.2 grms. of night blue. The amount of dyestuff remaining in the dye bath after immersion was found by titration with naphthol yellow. The percentage of night blue absorbed in the various stages of disintegration after the different periods of immersion is given in Table I.

The unbeaten cotton yarn showed a constantly increasing absorption during the 72 hours of immersion, whilst the most highly disintegrated pulp absorbed dyestuff very rapidly during the first hour of immersion, but a very small further amount of dyestuff was taken up during the remaining 71 hours of immersion. Thus in the case of cotton, the amount of dyestuff absorbed and the rate at which absorption takes place are very considerably influenced by the degree of disintegration of the fibers. When comparing the dyed samples it was found that the most highly disintegrated material was dyed to the same depth of shade as the original cotton yarn, although it had absorbed more than twice the amount of dyestuff.

---

* *Read before Technical Conference of Papermakers at Edinburgh, Scotland, September 26, 1923.*

This is no doubt due to the larger amount of fibrous surface exposed by the disintegrated fibers to the dyebath.

In order to ascertain whether this view is correct some fibrous material of simpler physical character was examined. For this purpose artificial silk of two kinds, differing only in that they consisted of fibers of the average diameters 0.0299 mm. and 0.184 mm. respectively, was used. Quantities of these two silks were cut into lengths of about 2 ins., and 10 grms. of each (dry weight) were immersed for 72 hours in 750 c.c. of solution containing 0.15 grm., of night blue. The fine silk absorbed 0.0986 grm., and the course silk 0.0558 grm., of coloring matter. It is thus clear that the finer silk, which exposes the larger surface, absorbs considerably more dye than the coarser material, and a direct indication is obtained that in the absorption of Night Blue by artificial silk the proportion taken up is roughly proportional to the surface exposed by the fibrous material.

Further confirmation of this result was obtained by studying the absorption of night blue by a chemically inert substance, namely, emery powder; two samples of levigated emery, the one very fine and the other much coarser, were used. One hundred grams of each kind were immersed for periods of 1, 6, 18 and 72 hours in 750 c.c. of water containing 0.15 grm., of night blue. The results were as follows:—

Table II.

Time of immersion in hours	1	6	18	72
Coarse emery	0.00081	0.0167	0.0263	0.05
Fine emery	0.05	0.0618	0.09	0.09

The behavior of the fine and coarse emery is clearly very similar in kind to that of the fine and coarse artificial silks, and also to that of the various grades of disintegrated cotton fiber. It is, therefore, concluded that the amount of surface exposed to the action of the dye solution greatly influences the proportion of dye absorbed, not only in the case of a material such as emery, which is certainly chemically inert, but also in that of cotton or artificial silk.

Although wool fibers are but rarely employed in the manufacture of paper, it seemed of interest to study this fiber under similar conditions, but using 10 grms., of absolutely dry fiber instead of 20 grms., as in the former experiments. The percentages of dyestuff absorbed is given in Table III.

It will be noticed that the results differ very materially from those obtained with cotton. The percentage of dyestuff absorbed after 72 hours' immersion was the same whether the fibers were in their original state or in a very highly disintegrated condition. In the case of wool the degree of disintegration influenced the speed at which the dyestuff was absorbed, but did not influence the amount of dyestuff absorbed.

Apart from the effect of the disintegration of the fibers on the absorption of dyestuffs, the degree of purity of the fibers and the amount of dyestuff absorbed by different vegetable fibers is, however, of considerable importance in the dyeing of paper pulp, particularly when a pulp consisting of a mixture of two or more fibers has to be dyed.

Table III. (Wool).

	Time of immersion in hours	Original fibres	1.5 hours' beating	3 hours' beating	4.5 hours' beating	6 hours' beating
Average length of fibre in mm.		29.0	3.12	2.2	0.7	0.4
Percentage of night blue absorbed	1	15.3	17.6	19.1	23.0	24.5
	6	18.3	19.1	20.7	23.1	26.1
	18	20.7	21.4	22.2	23.5	26.1
	72	26.1	26.1	26.1	26.1	26.1

Investigations with Principal Fibers

It was, therefore, considered necessary to extend the investigation to the following celluloses, which comprise the principal papermaking fibers, *i.e.*, bleached cotton waste, specially purified for the manufacture of gun-cotton; cotton half-stuff, made from the above by beating; bleached linen half-stuff; unbleached sulphite wood cellulose; bleached sulphite wood cellulose; bleached and purified sulphite wood cellulose; unbleached soda wood cellulose, made from pine wood; mechanical wood pulp; bleached esparto half-stuff; bleached straw half-stuff and unbleached jute half-stuff.

It having been shown that the length of the fibers may influence the amount of dye-stuff absorbed, it was decided to ascertain, as accurately as possible, not only the mean length but also the mean diameter of each of the fibers used. The method adopted in measuring the dimensions of the fibers was a variation of that usually employed, *i.e.*, by means of an ordinary microscope and a table micrometer; because in this, approximation often plays a more important part than actual measurement, especially when the objects present strongly curved lines. In the present method the apparatus used for photo micrography was employed.

A white screen was substituted for the camera, and a scale was first marked on the white screen from the magnified image of the scale on the table micrometer. The dimensions of the images of the fibers were then actually measured by means of a pair of dividers with reference to the scale on the screen. No knowledge of the degree of magnification is, therefore necessary as both the scale and the object are magnified to the same extent. In order to obtain greater accuracy in the case of very sinuous images an opisometer was used. The diameter of the fibers was ascertained by measuring the breadth of the images at several points and by taking in each case the mean of about 100 readings.

The hygroscopic moisture contents of the air-dry celluloses were also determined by drying at 100 deg. C. They were as follows: Cotton waste, 5.952 per cent.; cotton half-stuff, 6.817 per cent.; linen half-stuff, 5.332 per cent.; unbleached soda, 8.175 per cent.; bleached soda, 7.584 per cent.; unbleached sulphite, 8.229 per cent.; bleached sulphite, 8.484 per cent.; bleached and purified sulphite, 7.237 per cent.; poplar, 5.957 per cent.; mechanical wood, 9.548 per cent.; esparto, 6.805 per cent.; straw, 7.653 per cent.; jute, 8.978 per cent.

Absorption of Iodine

It is well known that the amount of iodine absorbed by different fibers varies. It was, therefore, considered of interest to ascertain the amount of iodine absorbed by the different celluloses used in the experiments.

Table IV.

	Length in Millimetres.			Diameter in Millimetres		
	Max.	Min.	Mean.	Max.	Min.	Mean.
Straw	2.0	0.15	0.535	0.024	0.005	0.021
Beached sulphite cellulose	3.2	0.12	0.908	0.058	0.012	0.029
Jute	2.6	0.14	1.175	0.020	0.005	0.0104
Esparto	1.96	0.15	0.643	0.015	0.005	0.009
Linen	2.39	0.15	0.710	0.026	0.006	0.015
Poplar	1.40	0.20	0.744	0.032	0.007	0.020
Soda Cellulose	3.65	0.32	1.605	0.046	0.015	0.030
Cotton halfstuff	3.10	0.27	0.90	0.023	0.009	0.019

For this purpose weighed amounts of the different celluloses each representing 10 grms., of absolutely dry substance were taken. The celluloses were reduced to pulp with water, and each was made up with water to 700 g. 50 c.c. of N/10 iodine solution was added to each and left for 48 hours, with shaking at intervals. The amount of iodine remaining in the solution was ascertained by titration with sodium thiosulphate solution. The amounts of iodine absorbed by the celluloses were then calculated. The results are given in Table V.

Table V.

	Absorption in per cent. of the total iodine added.
Cotton waste	9.70
Cotton half-stuff	10.46
Linen	13.08
Bleached sulphite	10.50
Bleached and purified sulphite	11.16
Unbleached sulphite	34.66
Bleached soda	10.36
Unbleached soda	35.50
Poplar	24.80
Mechanical wood	76.14
Jute	65.40
Straw	18.10
Esparto	16.14

The results show that the absorption of iodine in the case of all the bleached celluloses, with the exception of poplar, straw and esparto, are of the same order, that is about 10 per cent. of the total iodine used. The two unbleached wood celluloses, *i.e.*, unbleached sulphite and unbleached soda, absorb nearly the same amount (about 35 per cent.). In the case of both jute and mechanical wood (lignified celluloses) the absorption figures are very high indeed (jute 65.4 per cent., mechanical wood 76.14 per cent.).

In order to examine the coloration of the fibers after immersion in the iodine solution, the celluloses were filter-pressed. It was then noticed that the color of the different cakes did not only vary in intensity but also in shade.

Unbleached sulphite was a dark brown; bleached sulphite, much lighter and more yellow than above; bleached and purified sulphite, brown (a little darker than above); poplar, a light brown (about the same color as the bleached sulphite); unbleached soda, dark brown (darker in shade than unbleached sulphite); bleached soda, light yellowish brown (lighter than bleached sulphite); esparto, light brown (more yellowish than above); straw, a cream color with a bluish tinge (paler in shade than the other celluloses); linen, light brown; cotton half-stuff, brown (darker than linen with a bluish tinge); cotton waste, brown (darker than cotton half-stuff with a bluish tinge); jute, dark brown (yellow tinge); mechanical wood, dark brown (intermediate in shade between unbleached sulphite and jute).

In order to ascertain whether the iodine absorbed by the celluloses would show a tendency to go into solution, 250 c.c. of water was added to each of the cakes obtained by filter-pressing and left for 72 hours, shaking at intervals, after which the amount of iodine in solution was ascertained. The amount of iodine in the cakes after filter-pressing was then calculated from the quantity of the solution contained in each.

With the exception of jute, the amount of iodine actually found to be present in the water was a little less than that obtained by calculation. The poplar cellulose had become white, the solution colorless, and a pronounced odor of iodoform was noticeable. In the case of the unbleached sulphite and soda wood, the quantities of iodine found in solution were very minute.

After titration, the celluloses were left in the remaining solutions for some time.

A comparison with the coloration of the celluloses before immersion in water shows that considerable changes had taken place. The following colors were noticed after 96 hours:—

Cellulose	Colour of the Cellulose	Colour of the Solution
Unbleached sulphite	Brown	Almost colourless
Bleached sulphite	Cream colour	Slightly yellowish
Bleached and purified sulphite	Cream (lighter than above)	Slightly yellowish
Poplar	White	Colourless
Bleached soda	Yellow	Yellow
Unbleached soda	Dark brown	Colourless
Esparto	Yellow	Yellow
Straw	Light greenish-blue	Yellow
Linen	Light blue	Yellow
Cotton half-stuff	More bluish than above	Yellow
Cotton waste	More bluish than above	Yellow
Jute	Dark yellowish-brown	Yellow
Mechanical wood	Dark yellowish-brown (slightly lighter than above)	Yellow

In the dyestuff absorption experiments methylene blue and metanil yellow, respectively, were used. Weighed amounts of the different celluloses, representing in each case 10 g. of the dry material, were immersed in 450 c.c. of a solution containing 1 g. of methylene blue for 48 hours. The bottles were shaken at intervals. The amount of dyestuff remaining in the solution was then ascertained by means of a colorimeter. The amounts of dyestuffs absorbed are given in Table VI. in per cent. of the total dyestuff used.

The fibers from the absorption experiments were then made into paper by adding water to make up to 1 liter and by making sheets on a mould. Cotton waste was dyed the lightest, jute the heaviest shade. The depth of the shades increased in the following order: Cotton waste, cotton half-stuff, linen, bleached sulphite, esparto, bleached and purified sulphite, poplar, mechanical wood pulp, bleached soda, unbleached soda, straw, unbleached sulphite, jute. A comparison of the depth of shade to which the celluloses have been dyed with the amount of dyestuff absorbed shows that while there is decided agreement in some cases, there are marked differences in others.

Further absorption tests were carried out under identical conditions with metanil yellow, using, however, 0.25 g. of this dyestuff only.

Table VI.

	Per cent. of total dyestuff used.
Cotton waste	1.6
Cotton half-stuff	6.1
Linen	7.7
Bleached sulphite	14.8
Bleached and purified sulphite	.6.1
Unbleached sulphite	52.3
Bleached soda	20.5
Unbleached soda	29.5
Poplar	18.7
Mechanical wood	37.8
Jute	87.6
Straw	34.8
Esparto	18.7

The depth of the shades of the papers made increases in the following order: Cotton waste, cotton half-stuff, linen, bleached and purified sulphite, bleached soda, straw esparto, poplar, bleached sulphite, unbleached sulphite, unbleached soda, mechanical wood pulp, jute.

Table VII.

	Per cent. of dyestuff absorbed of the total added.
Cotton waste	8.8
Cotton half-stuff	10.1
Linen	9.4
Bleached sulphite	18.9
Bleached and purified sulphite	10.1
Unbleached sulphite	19.5
Bleached soda	7.5
Unbleached soda	17.3
Poplar	17.3
Mechanical wood pulp	57.1
Jute	64.7
Straw	7.5
Esparto	16.6

The absorption figures in the case of metanil yellow show less irregularity than those of methylene blue. The same applies to the order in which the depth of the shades increases.

A comparison of all the tables shows that the lignocelluloses and the unbleached celluloses derived from lignocelluloses give the highest absorption figures. The bleached wood celluloses, bleached straw and bleached esparto, give absorption figures which are lower than those of the unbleached celluloses. Bleached cotton and bleached linen and purified sulphite cellulose give the lowest absorption figures. Mechanical wood pulp absorbs more iodine than does jute, but the latter absorbs more dyestuff than the former.

A comparison of the moisture contents of the celluloses with the iodine and the dyestuff absorption figures shows that in the case of the lignocelluloses (mechanical wood and jute) and the unbleached wood celluloses, there seems to be a distinct relation between the absorption figures and the moisture contents. In the case of the bleached celluloses, the iodine and the dyestuff absorption figures agree fairly well, but they do not agree as satisfactorily with the moisture contents.

That both the quality and the quantity of loading material added play an important part in the dyeing of paper pulp is well known.

It was found that china clay absorbed 67.5 per cent. of the total night blue, 10 per cent. of the total diamine sky blue FF, and 7.4 per cent. of the total iodine used.

A comparison shows that the absorption figures for china clay and for beaten cotton are practically identical.

It is also well known that the addition of resin size and the precipitation of free resin in the pulp and on the fibers is a valuable assistant in the dyeing of paper pulp.

The results of a large number of experiments have, however, shown that the color fixing action of the resin, although very marked, is but little influenced by the nature and the degree of purity of the fibers or by the kind of dyestuff employed.

So far, the investigation has been confined to the simplest methods of dyeing paper pulp. There are, however, other fields which require systematic investigation, the results of which should be of value to the industry.

More Attention to Dyeing Needed

Enormous strides have been made in the dyeing of textiles within the last twenty years particularly in the production of fast shades, while, comparitively speaking, but little progress has been made in the dyeing of paper pulp.

I venture to suggest that the paper dyer, who has not done so hitherto, should pay more attention to the processes of dyeing, which are a little more complicated than those in general use, but which produce shades of superior fastness, and which, in many cases, would result in lowering the cost of production.

Among such processes are the application of the natural vegetable dyestuffs, such as logwood and catechu, either alone or in combination with the coal tar dyestuffs, in order to improve the fastness of the latter; the use of basic dyestuffs in conjunction with acid dyestuffs in dyeing heavy shades with a colorless

(Continued on page 25)

Summary of Paper Industry for September

THE statistical summary of the paper industry is submitted herewith for the month of September, 1923, and previous months.

The following associations cooperate in the collection and compilation of data from their members, namely, Binders Board Manufacturers Association, Converting Paper Mills Association, Cover Paper Manufacturers Association, Newsprint Service Bureau, Tissue Paper Manufacturers Association, Wrapping Paper Manufacturers Service Bureau and Writing Paper Manufacturers Association.

Tonnage Summary

GRADE	Number of Mills	Stocks on hand first of month	Production	Shipments	Stocks on hand end of month

P. L. Buttricka, graduate of the Yale School of Forestry has been engaged by the Connecticut Forestry association to serve as a full time secretary and forester. His three chief campaigns, as determined by the association, will be the acquisition of a forest to be called the association forest and managed for recreation and timber production; to assist every town in the state to acquire a woodland park; and to assist private owners in securing adequate fire protection for their timber.

The Independent Paper Stock Co., Fresno, Cal., has let the contract for a factory and warehouse at 3035 Buller avenue, to cost about $40,000 and be two stories high and 60x140 feet. W. H. Bates is manager.

Wood Pulp Review for September, 1923

THE American Paper and Pulp association in cooperation with the U. S. Pulp Producers association submit herewith statistics on pulp production, consumption and stocks for the month of September, 1923 and previous months.

Pulp Production

The statistical table following gives the number of mills reporting stocks as of the first of the month and end of the month, production during month, amounts used by mills producing same with amounts shipped to concerns other than those producing same.

GRADE	Number of Mills	On hand first of month	Production for month	Used during month	Shipped during month	On hand end of month
Ground Wood Pulp:

Waste Paper Specifications

The Paper Industries Exchange has adopted the following specifications for waste paper as drawn up by its paper stock committee:

No. 1 Mixed Papers:—This grade shall consist of dry waste paper which has been sorted and cleaned by screening, dusting or hand sorting, and packed in machine pressed bales weighing not less than 800 pounds or more than 1500 pounds. Not to contain more than one (1%) per cent of foreign materials and objectionable papers. See definitions.

No. 2 Mixed Papers:—Dry, unsorted paper in bales of 100 pounds and over. Not to contain more than five (5%) per cent, either weight or bulk, of foreign material and objectionable papers. This grade to be free from city dump paper. See definitions.

Dump or City Mixed:—To be packed and sold as such.

Box Board Cuttings:—To consist wholly of cuttings and clippings from paper box factories. It shall be dry and free from dirt and refuse matter, and packed in bales weighing 100 pounds and over. This grade to be accepted as good delivery on No. 1 repacked Mixed Paper.

News Over Issue:—This grade shall consist of overruns and unsold newspapers direct from the newspaper offices, folded as they come from the press in securely tied bundles.

No. 1 News:—Strictly dry, clean, sorted and repacked newspapers in machine pressed bales weighing not less than 500 pounds or more than 14500 pounds. Not to contain more than one (1%) per cent of foreign material and objectionable papers. See definitions.

No. 2 News:—This grade shall consist of dry newspaper, which has not been recleaned or sorted, in bales weighing between 500 and 1500 pounds each. Not to contain more than five (5%) per cent of foreign material and objectionable papers. See definitions.

News Blanks:—Shall consist of white news cuttings or sheets, free from all printed matter, and not to contain more than two (2%) per cent tinted blanks. In bales of 400 to 1500 pounds each.

No. 1 Printed Manilas:—Shall consist of dry, sorted and repacked manilas and strong fiber paper, writing paper and good office waste. in bales of 400 to 1500 pounds each. Not to contain over three (3%) per cent of mixed, news, box cuttings or objectionable paper and foreign material. See definitions.

Container Manilas:—Shall consist of sorted or unsorted department store paper, which contains a large per cent of strong fiber stock, in bales of 300 pounds and over. Not to contain more than three (3%) per cent of foreign material and objectionable paper. See definitions.

No. 1 Kraft:—Shall consist of dry, sorted and cleaned Kraft Papers in bales of 300 to 1200 pounds each. This stock must not contain more than one (1%) per cent of foreign material and objectionable papers. See definitions.

Hard White Shavings:—Shall consist of dry, hard, sized, white writing paper, free from all colors and tints, ground wood, foreign materials and objectionable papers. May have some machine ruled paper, but not printed ruled. In bales 400 to 1200 pounds each. See definitions.

Soft White Shavings:—Shall consist of dry, all white book paper cuttings, not to contain more than two (2%) per cent ground wood, colors and tints or more than eight (8%) per cent coated paper. In bales 400 to 1200 pounds each.

Definitions

Foreign Material includes every non-paper substance.

Objectionable papers, including paraffined, greased, glazed, parchment, tar, carbon, wall paper, book covers and strings.

When stock of an inferior grade is shipped and the fact is apparent without opening bales, notice of rejection must be promptly given shipper.

If No. 2 stock is shipped where No. 1 stock has been ordered, buyer can refuse the shipment by giving seller reasonably prompt notice, or he may take same in at a reduction of four ($4.00) dollars per ton.

Joint Convention at Appleton

Technical Association, Cost Association and Northwest Division of Superintendents Association Hold Highly Successfully Meeting—Summary of the Proceedings

THE most successful series of meetings that have ever been held by the Technical association, the Cost association and the Northwest division of the Superintendents association was held at Appleton, Wis., October 25, 26 and 27. Over three hundred and fifty members of the three associations and guests attended the various meetings and it was the unanimous opinion that it was the most successful Fall meeting ever held.

Thursday, October 25th, members of the different organizations began to arrive at the convention headquarters, which was the Conway hotel. Emmet J. Carey, registrar, opened up for business immediately after dinner and over fifty members registered that evening.

Friday morning a meeting of the Kraft association was held at the Conway hotel. Professor White of the University of Michigan read his report.

The business session of TAPPI, was also held on Friday morning.

H. S. Taylor, president of the association, in his address of welcome stated that there were nineteen committees making investigations along lines of interest to both technical men and executives in the pulp and paper industry.

He emphasized very strongly the necessity of cutting down waste and increasing efficiency.

There are now 560 members in the Technical Association.

After Mr. Taylor's address W. D. McNaughton, secretary of the association, stated that there had been 51 new members added and also that he was very glad to report that the $5000 deficit in the Vocational Education Text Book Fund had been cleaned up, all the credit for which was due to the untiring efforts of B. T. McBain. He also referred to the new apprenticeship system which is being worked out.

The revision and re-drafting of the constitution was discussed.

The following committees reported:

Coated and Process Paper by Secretary MacNaughton.

Light, Heat and Power by W. W. Cronkhite.

Mr. Spence reported progress of soda pulp investigation.

Mr. MacNaughton read the report of Sulphite committee.

Mr. Bearce of Drying Committee spoke on Paper Drying methods.

J. D. Rue gave a talk on decayed pulpwood.

O. M. Porter, secretary of the Woodlands section said members were glad to co-operate in the furtherance of the apprenticeship idea in forestry, especially in the woods, and that there was a dire need for trained foresters.

The joint session of the three associations was held Friday afternoon. B. T. McBain, asistant superintendent of the Nekoosa-Edwards Paper company, acted as chairman.

After expressing his appreciation of the honor thus conferred upon him, Mr. McBain continued, "It is an honor further, however, for the reason that this is the first joint convention of members of these three truly great associations of this 7th greatest industry of our own America. The Industry needs more such meetings, where all departments may become better acquainted, rub shoulders together and learn that they are not such bad fellows after all, learning that the industry needs all three types of men that these three associations represent, needing one just as much as the other.

"There was a time when the profit in the pulp and paper industry in America was so great that the bank balance of each company told the story in a manner satisfactory to the board of directors without expensive cost systems; when the amount of wasted everything from log to finished product went by unnoticed and the technical man was not of much face value, nor even thought of; when the superintendent was Lord of all he surveyed and did not need assistance from anyone, or at least thought he did not.

"These conditions have changed; our timber supply is about exhausted; the margin between cost and selling price is many times on the wrong side, while the waste in many if not all plants amounts to more than the old time profit, and the industry now badly needs that complete co-operation that alone can bring results; that complete co-operation from each of the three types here seated, that each of the three legs of a three legged stool lend each other. When that is accomplished, then and then alone will the pulp and paper industry in America be on the right basis.

"The superintendent who thinks he knows it all is going backward; doesn't belong to the Superintendents association and the Superintendents association does not want him as a member.

"The Technical man who flags or waves his education and technical terms in the face of his fellow worker, the superintendent or cost man, is not worthy of the name of a Technical association brother; the cost man in any plant who takes things over the head of the superintendent or his fellow worker, the technical man, without trying to co-operate with the other two, will never get ahead and reach that goal of success we all look forward to.

"We all have positions of responsibility and where responsibility lies, there must authority also rest; but just because

Those attending the Papermakers' convention at Appleton, photographed before the Kimberly club at Kimberly, Wis.

we have certain authority is no reason why we should consider we have it all, nor why we should exercise what we do have. We must give and take in this life and those who are so inclined, make the best executives and get the best results.

"I look forward to the day when the annual convention of these three cooperating associations will be held at one time for three or four days to a week and at least one day thereof given to joint papers and discussion and a general love feast. In fact, I recommend such action at this time to the national officers of the Technical association as well as to the division and national officers of the other two associations, who may be present."

Mayor Reuter of Appleton welcomed the delegates to the city and responses were made by H. S. Taylor, president of the Technical association; F. C. Boyce, for the Superintendents association and C. A. Jasperson, president of the Cost association.

Mr. Boyce, "the father, and grand old man of the association," reviewed the history of the association and predicted that within five years every superintendent "who is a superintendent" would be a member. He also sketched the growth of the papermaking industry in Wisconsin from the establishment of the first paper mill in the state in 1860 at Appleton by G. N. Richmond and brother.

Mr. Jasperson referred briefly to the function of the cost man in the operation of a paper mill and showed the necessity for correct figures on costs necessitated by the keen competition in the industry.

The forestry question was discussed by Secretary Porter of the Woodlands section and R. S. Kellogg of the Newsprint Service bureau.

This ended the joint meeting, the different associations holding separate sessions.

The following papers were presented at the Friday meeting of the superintendents:

Beaters and Beating by C. E. Youngchild of Nekoosa Edwards Paper Co.
Colors by K. T. King of Dupont Co.
Wires by J. D. Buchanan of Appleton Wire Works.
Waste in Sulphite Industry by O. L. Berger of G. D. Jenssen Co.

While the superintendents were discussing their papers and problems the technical men held a meeting. There were reports on Heat Losses and the Method of Handling Materials. Considerable discussion was held on these subjects.

At the Cost association meeting F. C. Shymanski of Whiting Plover Co. was elected president, and P. D. Baron of Marathon Paper Mills Co. was elected secretary and treasurer.

The visiting ladies were not forgotten by the committee. On Friday afternoon they attended the football game between Cornell and Lawrence college and from the reports everyone was delighted with the game. Saturday afternoon a tea and musical was held in their honor at the Appleton Women's club rooms.

Business Meeting of Superintendents

There was only one meeting scheduled for Friday evening, that being the business meeting of the Superintendents association.

The following officers were elected for the coming year:

L. E. Smith of Nekoosa Edwards Paper Co., chairman
V. P. Edwardes, Interlake Pulp and Paper Co., 1st vice chairman.
A. A. Stone, Marinette & Menominee Paper Co., 2nd vice chairman.
Paul Smith, Combined Locks Co., 3rd vice chairman.
Wm. Kraske, Consolidated Water Poper and Paper Co. secretary and treasurer.

The chairman was authorized to appoint a committee to select a time and place for the Spring meeting.

Addresses were given by F. C. Boyce who urged continued cooperation. Jos. H. Slater spoke of the good that the organization was doing and how the enforcement of the 18th amendment in the industry is exceptionally helpful to all. B. T. McBain gave a very interesting report on industrial Education the past year at the Nekoosa Edwards Paper Co. and urged all superintendents to try and get their mills to do as his company had done and is doing.

Saturday morning was spent in visiting the various mills. Practically every member of the three associations visited the Kimberly mill at Kimberly where they were shown through the plant by guides. A fine complimentary lunch was served in the new clubhouse of the Kimberly Clark Co.

At the Saturday afternoon joint meeting of superintendents and technical men the following papers were presented:

Oiling by C. H. Bromley, S. F. Bowser Co.
Heat Losses by E. P. Gleason, Nekoosa Edwards Paper Co.
Felts by A. H. Theurer, Appleton, Woolen Mills.
Groundwood by Lyman Beeman, of Consolidated Water Power & Paper Co.

At its meeting Saturday the cost association decided to hold a meeting every two months, the next being on the 18th of December.

There was considerable discussion on the following: Manufacturing Burden and items coming under that head; administration and general; Depreciation and Obsolesence and the handling of repairs of an extraordinarily large nature.

A joint banquet of all three associations was held in the Eagles hall. After the very eleborate banquet Mr. McBain led the singing.

Gustaf Keller acted as toastmaster and introduced Geo. P. Hambrecht, state director of vocational education of Wisconsin, who gave an exceptionally interesting address on "The Part Time School Movement in Wisconsin." Prof. Alfred H. White, professor of chemical engineering, University of Michigan, also presented a very interesting address.

Each and every member of the three associations went home with a feeling that two days could not be more profitably spent and that the trio the technical man, superintendent and cost man were getting closer together which will result in greater production and decreased cost.

The general committee of the joint convention consisted of B. T. McBain, F. C. Boyce, J. H. Slater, W. A. Kelley and Vance P. Edwardes and to them is due the credit for the fine papers which were represented.

The local committee consisted of Vance P. Edwardes, chairman, Paul Smith, John Hersher, E. A. Peterson, O. P. Schlafer and H. G. Corbett and to this committee and the business houses and Chamber of Commerce of Appleton is due the credit for making this convention the best of its kind that has been held.

Those In Attendance

Cost Association Members

The following is a complete list of those registered at the meeting:

R. D. Baron, Marathon Paper Mills Company.
Harry Deyo, Nekoosa-Edwards Paper Company.
J. A. Harky, Tomahawk Fibre & Paper Company.
John Hemminger, The Falls Mfg. Company.
C. A. Jasperson, Nekoosa-Edwards Paper Company.
Paul Koenigs, Continental Paper Bag Mills.
Herman A. Korth, The Falls Mfg. Company.
L. Larson, Menominee & Marinette Paper Company.
E. A. Lindberg, Northern Paper Mills.
D. J. McIlm, Falls Mfg. Company.
A. M. Plier, Falls Mfg. Company.
Arthur A. Zimmerman, Hummel & Downing Co.

Technical Association Members

John E. Alexander, Nekoosa-Edwards Paper Co.
Amos L. Allen, General Electric Company.
A. E. Armstrong, Armstrong Machine Works.
W. H. Artz, Westinghouse Elec. & Mfg. Co.

Parker K. Baird, U. S. Forest Service, F. P. Lab.
W. E. Byron Baker, The York Haven Paper Co.
Geo. D. Bearce, News Print Service Bureau.
John S. Bersch, Falls Mfg. Co.
O. L. Berger, G. D. Jenssen Co.
L. M. Booth, Booth Chemical Co.
Ralph L. Bosworth, Croker-McElwain Co. and Chemical Paper Mfg. Co.
S. C. Brayton, Consolidated Water Power & Paper Co.
James A. Cameron, Cameron Machine Co.
James L. Carey, James L. Carey Co.
C. J. Christiansen, Fibre Making Proc.
P. W. Codwill, Beaver Products Co.
W. W. Cronkhite, General Electric Co.
Phillip Dennett, Bird Machine Co.
O. S. Egan, Nekoosa-Edwards Paper Co.
T. L. Edmonds, Wausau Paper Mills Co.
Gust, Ferd, Enderlein, Ontonagon Fibre Co.
Ervan Erisyan, Marinette & Menominee Paper Co.
I. Gordon, Lee Paper Company.
H. W. Guettler, Fibre Making Processes.
R. O. Harper, B. D. Rising Paper Co.
H. H. Harrison, Crystal Tissue Company.
John A. Hanson, Menasha Printing & Carton Co.
Chas. L. Henderson, Kimberly-Clark Co.
C. C. Hockley, American Lakes Paper Co.
R. S. Kellogg, News Print Service Bureau.
W. L. Lawrence, Western Paper Makers Chemical Co.
R. E. Lofton, Bureau of Standards.
C. R. Mac Donald, Gardner & Harvey Co.
W. G. Mac Naughton, Secrteary T. A. P. P. I.
Ernst Mahler, Kimberly-Clark Co.
R. N. Miller, U .S. Forest Products Laboratory.
A. E. Montgomery, J. O. Ross Engineering Corp.
R. G. North, G. B. Lox Mch. Wks.
W. A. Pitts, York Haven Paper Co.
Arthur T. Randall, Westinghouse Elec. & Mfg. Co.
L. E. Randecker, Hammermill Paper Co.
Francis C. Rawling, Forest Products Laboratory.
Henry A. Rotschild, Kimberly-Clark Co.
John D. Rue, Forest Products Laboratory.
Thomas H. Savey, Bird Machine Co. and Nash Engineering Co.

Nepco Entertains Paper Salesmen

Thirty-two Chicago representatives of the Inlander Steindler Paper company headed by Mr. Steindler, vice president and general manager, in two special cars visited the plants of the Nekoosa Edwards Paper company October 20. A. R. Jackson, manager of the Chicago office of "Nepco," accompanied these gentlemen on the trip.

The first place visited was the Nepco hydro-electric plant, at Wisconsin Rapids, which furnishes about ½ of the Company's Hydro Electric Power; from this power house the party proceeded to Port Edwards. Here they saw the processes in the manufacture of paper, starting with the sawing and barking of the wood, the groundwood and sulphite process, the making of the paper from these and the shipping of the finished product. Luncheon was served at the Nepco hotel.

After lunch the men resumed their journey to Nekoosa visiting all the plants there. At Nekoosa there is also a sulphate mill. One of the famous brands of Nepco paper in which these men were particularly interested was on the Nekoosa machines so they were able to see just what went into it and how it was manufactured.

A dinner at the Bull's Eye Country club at Wisconsin Rapids closed the days program, the party leaving on the evening train for Chicago.

Use of Control Methods In Grinding

Two Methods Available in Groundwood Mill, Control of Stock Volume and Individual Stones—Graphic Charts Show Results of Operation

By **Lyman Beeman***

Consolidated Water Power & Paper Co., Wisconsin Rapids, Wis.

THE use of laboratory control methods in grinding has been a fairly recent development in the operation of groundwood mills. It has been a part of the rapid growth in recent years of pulp and paper technology. When control methods are spoken of it is naturally assumed that some avenue of information as to the facts has been provided to make possible the most efficient and desirable supervision of the operating units. This, then, is the basis of grinding by laboratory control—to learn quickly and accurately the facts in regard to the product of the grinders and to use these facts in sustaining or correcting the output.

The old so-called "practical" methods of operating grinders by the feel and looks of the stock and the running conditions of the stone are very effective when used by an experienced pulp maker but lack the quality of numerical expression which is so essential to keeping of records and to standardization of operating conditions. The use of these vague and uncertain practical methods can by no means be abandoned with benefit but rather should be used to supplement the more definite and reliable numerical indication of quality which such a test as the "freeness test" gives.

The most common and familiar method of measuring the quality of the stock which a stone is producing is by the use of the "freeness" or "sedimentation test." Although the strength test on hand sheets of groundwood gives some indication of the stock quality, the freeness test may be said to be practically the only test of any wide use or importance. It is the use of this test that we will consider. Other tests such as examination by the blue glass, the microscope, or the lantern slide give some indication of quality but do not lead themselves to routine work or to numerical expression. The blue glass is the most simple and we sometimes use it if some further information about a stock seems desirable.

The problem of control may be approached from two angles—first, the control of the aggregate volume of stock going to paper machines or, second, to the control of the individual stones producing the stock. By controlling the freeness of the aggregate volume going to the machine the pulp mill may serve the paper mill to the best possible advantage and by controlling the individual stones the pulp mill may grind with the greatest efficiency. These two phases of control naturally go hand in hand.

Control of Stock Volume

With the object of delivering a stock of uniform freeness to the machine chest, the groundwood as it enters the measuring system is sampled and tested every hour, the results being then posted on the testing station log sheet and on the chart on the grinder room bulletin board in the form of a freeness curve.

Three of these bulletin board sheets are shown in Charts Nos. 1, 2, and 3 just as they were taken from the bulletin by the testing station operator and filed. Chart No. 1 was made on May 4, 1923, during the spring grinding season when the stock was being produced at 100-110 freeness. Chart No. 2 was made on July 24, 1923, when practically all of our consumption was being ground but at a freeness of 90-100. Chart

(Continued on page 17)

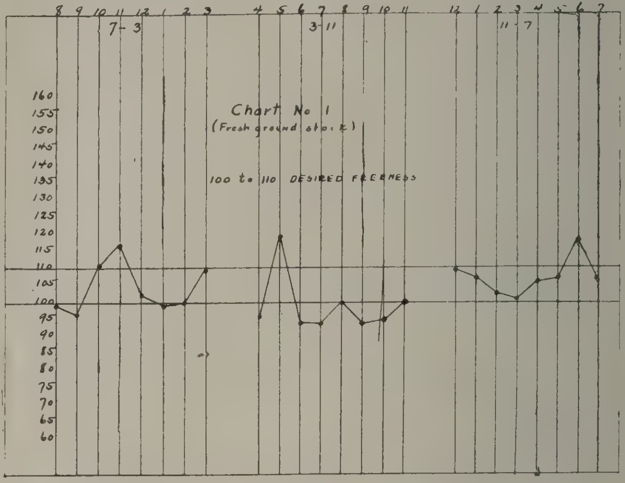

Chart No. 1. Desired freeness 100 to 110.

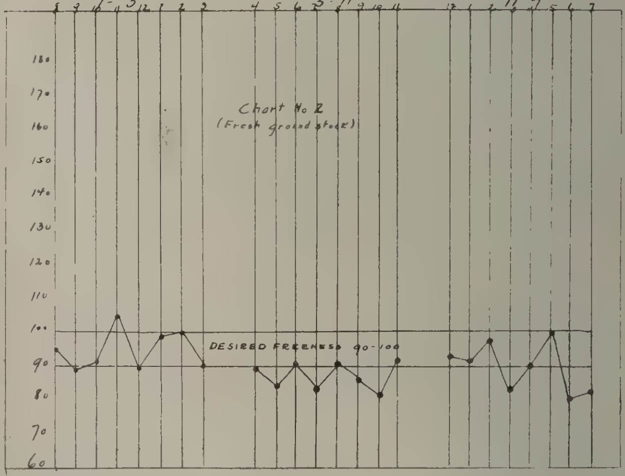

Chart No. 2. Desired freeness 90 to 100.

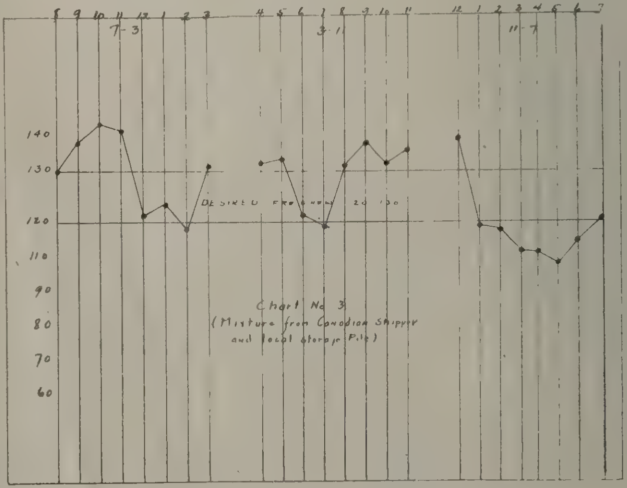

Chart No. 3. Desired freeness 120 to 130.

Forestry in the Paper Industry

Conducted by J. R. Simmons, Secretary Forester, The New York State Forestry Association

Protective Association Organized

An aggresisive campaign for a definite progressive forestry policy for the state of Wisconsin will be the outcome of an important meeting held at Wausau, Wis., October 23rd, at which representatives of fourteen Wisconsin paper and pulp mills organized the Wisconsin Forest Protective association, with a program of scientific taxation, adequate forest fire prevention and reforestation as the objectives.

The new organization was perfected after a conference of the paper manufacturers with several state officials, including State Tax Commissioner Lyons, State Conservation Commissioner Hall and State Forester Harrington. D. C. Everest of the Marathon Paper Mills company of Rothschild, Wis., was elected president, J. L. Delbridge of the Falls Manufacturing company of Oconto Falls, Wis., vice-president, and B. T. McBain of the Nekoosa-Edwards Paper Co. of Port Edwards, Wis., secretary-treasurer.

The conference will have an important bearing upon the future of the Wisconsin paper industry as concerns its supply of pulpwood. Wisconsin, third in the amount of production of paper among all the states of the Union, has been backward in its forestry development, not having felt the pinch of shortage already evident in the East.

The conference is due to the efforts of the American Paper and Pulp association, in cooperation with such men as Mr. Everest from the Wisconsin field, to develop a forestry policy for Wisconsin that will insure the permanency of the paper industry in that state through preservation of its forests and their continued production of the raw material needed. Recent forest fires aided not a little in bringing about a realization of the need for aggressive action by the mills themselves.

The announced policy of the new organization is to take active leadership in forestry matters as an economic matter, and Dr. Hugh P. Baker, executive secretary of the American Paper and Pulp association, was one of the chief speakers at the Wausau meeting. It was his cooperation with State Forester Harrington and Mr. Everest and other manufacturers which made the conference possible. He has pledged to the organization all the assistance that the paper industry can give.

Fires in Wisconsin

What fire prevention in the forest means to the paper industry was brought seriously to the minds of all timberland owners of Wisconsin by fires occuring this month in the northern area of that state and in northern Michigan. Fires in both states threatened paper company holdings and it is very possible that more complete reports will indicate that some losses were actually sustained by paper companies in those regions.

Two arrests were made for the setting of fires in northern Michigan and confessions secured from those accused. The two men arrested, however, deny starting a fire which resulted in a fatelity.

Forest fires between Ashland and Superior, Wisconsin, were in the region where several paper companies have holdings. A fire in the Upper Peninsula of Michigan did heavy damage to a lumber company's holdings, but fears for the property of the Ontonagon Paper company proved to be baseless. The company's timberland holdings were endangered but the fire was checked in time. The fires in northwestern Wisconsin were so serious that detachments of the national guard were called out to fight the flames. Rain was the final factor in turning the tide of loss, and there is not much liklihood of further danger this fall.

These fires have accentuated the need for better fire prevention methods. One of the companies that has been in active cooperation with the state and federal authorities is the Cornell Wood Products company, which has established a cooperative fire prevention system.

Forestry Legislation Among States

Twenty-two states enacted some form of forestry legislation during the year 1923. This means that action was taken by more than half of the states where legislatures were in session and timber taxation was one of the live issues of the year

Thirteen states east of the Mississippi enacted some form of forestry legislation, but California enacted the largest number of laws—seventeen in all, including resolutions and amendments.

Vermont decided to exempt all artificially planted forest land from taxation on its timber content for thirty years, such land to be taxed on its value as bare land alone.

Michigan passed a deferred tax law, but it was vetoed on a technical basis by the governor. It will probably be repassed in a corrected form by the next legislature.

Minnesota will submit a constitutional amendment to a vote of the electors providing for a deferred yield tax.

Several states passed laws to promote fire prevention, but most of these do not apply in a material way to paper and pulp company holdings.

Aeroplane Survey Continued

The use of aircraft for fighting forest fire and for forest cruising in Quebec has not been checked by this season's series of accidents. Flying has been resumed in the Lake St. John district and an attempt will be made to complete this summer's surveying program.

In addition to the work of the government, several surveys are being made for Price Brothers and the inventory of the forest resources of that company will be carried on next summer on a larger scale than ever.

Final Hearings by McNary Committee

The schedule has been completed for the final hearings of the so called McNary committee of the U. S. Senate which has been investigating forestry conditions throughout the country.

Before presenting its report to the Senate the committee will hold hearings at Asheville, N. C., Nov. 15 and 16; Harrisburg, Nov. 19 and 20; Washington, D. C., Nov. 22, and possibly 23.

The hearing at Asheville will involve the forestry problem of the Carolinas and Virginia, where the paper industry is rapidly developing, and the Harrisburg hearing may be attended by Pennsylvania paper men.

R. S. Kellogg, chairman of the National Forestry Program committee, will be an important witness at the final hearing at Washington where he will urge the cooperative method in the Snell bill, and in general outline the requirements of the paper industry as well as the other wood-using industries.

Senator McNary is quoted in an interview at Tacoma, Wash., as saying that the senate bill for the promotion of reforestation will include the following probable provisions:

Greatly augmented equipment and personnel for protection against forest fires.

A nominal tax on logged off lands segregated for reforestation, probably a form of yield tax.

Improved logging methods and elimination of waste.

Cooperation between national government, states and private owners in promotion of reforestation.

Secretary Wallace on Alaska

Secretary Wallace of the Department of Agriculture has issued a new statement on the possibilities of Alaska in the development of the paper industry on the Pacific coast, in the form of a correction of an editorial in a paper trade journal. His letter, which has been given wide distribution, discusses in some detail the waterpower and transportation situation in Alaska and concludes by saying:

"In short, the rate of development of the pulp and paper industry in the Territory will be controlled by the economic factor of distance from consumption centers, and by the necessity, inherent in the industry itself, for large capital investments rather than by physical disadvantages.

"The physical conditions in southeastern Alaska—presence of cheaply developed power, an enormous supply of inexpensive wood, and the availability of water transportation—are the very factors which make inevitable the expansion of pulp and paper manufacturing in the Territory."

Hoo Hoo Adopts Forestry Program

Hoo-Hoo, the fraternal society of the lumber industry, at its recent annual meeting adopted a forestry program and has authorized the extension of its membership to foresters.

The convention adopted resolutions making tree planting a recognized activity of every Hoo-Hoo club. Where possible such planting will be conducted in cooperation with state and national forestry departments and a permanent forestry committee will be appointed. This decision has already been followed by several announcements of the establishment of Hoo-Hoo experimental plantations in various parts of the country.

European Methods Impress U. S. Senator

Senator Couzens of Detroit, who visited Europe while the Senate Committe on Reforestation was touring the United States, has given out an interview on his return saying that the European method of meeting the reforestation problem has given him valuable information.

He proposes to utilize this information in future work with the committee.

The New York State Forestry association has been making a special effort along the lines of municipal and industrial forestry. A considerable number of the 65 municipal forests now under development in the state have been started under Forestry association influence. The industrial forestry movement is being carried on largely among the business firm members of the association. Nearly one thousand firms, representing all lines, joined with the association last year.

Prospect of New Frazer Mill

The Fraser Companies Limited may establish a paper mill at the mouth of the Tobique river in New Brunswick, at the junction with the St. John river. When the hydro electric development at Grand Falls is undertaken this mill will likely be built. The Fraser Companies Limited was originally known as the Fraser company, and founded by the late Donald Fraser of Fredericton N. B. Besides lumbering interests in Fredericton, pulp mills were built at Edmundston and Chatham in New Brunswick. The company executives are: Archibald Fraser, president; Donald Fraser, vice president; A. W. Brebner, treasurer; W. Matheson, secretary. The board of directors consists of the Messrs. Fraser, Matheson and Brebner in association with Thos. Matheson and W. C. Pitfield. The president and vice president of the concern are sons of the founder. The executive offices are in Fredericton.

The Fraser business was founded within the family forty-six years ago. Four years ago, an issue of two million dollars in six per cent ten year first mortgage bonds was made. This was followed by another two million dollars issue in eight per cent general mortgage bonds two years ago.

The Edmundston mill is the larger of the two mills controlled by the company. Capacity at this mill is 120 tons of bleached pulp daily. The capacity of the Chatham mill is 60 tons of unbleached pulp daily.

Somewhat over four million cords of pulpwood is owned on the company's extensive timber lands, in New Brunswick and Quebec.

The Fraser company suffered severely during 1921 and 1922, there being a deficit of nearly $1,500,000 for 1921, and $260,000 for 1922. The surplus has been reduced by these deficits to $523,759.

Some improvement is said to be exhibited thus far this year, and there is a possibility of a surplus for this year, although no definite statement will be available for some months. Both the Edmondston and Chatham mills have been operated steadily, although there is a report of the pending suspension of operations at the Chatham mill. It is believed that if the company establishes a paper mill at the junction of the Tobique and St. John rivers the cheap power available from the Grand Falls development operations, formerly controlled by the International Paper Company, will be instrumental in showing a profit in operation. The only object to the mill at this site has come from salmon and trout fishermen and fishing clubs, who assert the dam at the month of the Tobique river will injure the fishing.

Embargo Seems Remote

The reason for the marked drop in exports of pulp wood during September is undoubtedly to be found in the fact that American mills have come to the conclusion that there is very little need to worry over the threatened embargo.

This view seems to be well founded. There are two reasons for it. In the first place, there is the prime minister's statement during the last session of parliament to the effect that if an embargo were placed on exports of such wood cut on privately owned land the wood of farmers and settlers would be exempt. In the second place, on August 14th the Canadian government passed an order in council which exempted from an embargo that may be declared exports of wood under contract dated prior to June 1st, 1923. As Mr. Barnjum points out, there is now very little wood left that would be affected by an embargo.

This turn in affairs confirms reports to PAPER that the opposition to the embargo proposal was growing to such an extent that it was likely to defeat the project.

Vol. XXXIII November 8, 1923 No. 3

May Forclose A. W. P. Co.

That foreclosure proceedings will shortly be instituted by the bondholders against the properties of the American Writing Paper Company of Holyoke, Mass., and elsewhere is broadly hinted in a notice issued by the Old Colony Trust Co. of Boston, leading depository for the six per cent first mortagage bonds of the company.

In its statement the company says: "The time for receiving deposits under the bondholders' protective agreement has been extended to and including Nov. 20, 1923. Since the date of the first notice calling for deposits of the bonds, permanent receivers have been appointed on creditors' bills filed in New York, Massachusetts and other jurisdictions in which the company owns property. These appointments constitute a default under the mortgage.

"To protect the interests of the bondholders foreclosure proceedings should be instituted promptly. The committee, however, will not feel justified in requesting the trustees under the mortgage to institute such proceedings until a substantial amount of the bonds have been deposited. The importance, in their own interest, of promptly depositing their bonds is therefore urged upon all bondholders who have not already deposited."

The company urges that bonds be deposited with it, with the Central Union Trust Co. of New York or with the Springfield Safe Deposit & Trust Co. of Springfield, Mass. Certificates of deposit will be issued and application has been made to list these certificates on the Boston and New York Stock exchanges. Josiah F. Hill of 44 State street, Boston, Mass. is secretary of the Protective committee.

Special Meeting of Paper Exchange

A special meeting was held October 25 on the New York Paper Industries exchange in the Pershing Square building, 100 East Forty-second street, at which were present President George W. Gair and Executive Vice President John R. Mauff of the exchange, and more than half a hundred waste paper packers and brokers, and a scattering of paper board dealers. The meeting was held at 11 a. m., prior to the usual hour of trading betewen 12 o'clock noon and 1 p. m., and was arranged by the exchange officers to provide a time and place for paper stock dealers to ask questions concerning the operations of the exchange, its purposes and plans.

President Gair opened the meeting and talked at considerable length on the aims of the exchange and the benefits to be derived from membership in the trading body by waste paper concerns. He stated that the primary purposes of the exchange are to stabilize prices of box board and waste paper, to determine the market values of these commodities through the exchange system of trading, and to breed a more cordial feeling and better business relations between board and paper mills and the dealers in raw material consumed by such mills.

Mr. Mauff followed Mr. Gair and outlined the system of trading in practice on the Paper Industries exchange in New York and Chicago, and emphasized how sucessful this mode of trading had been in other commodities, notably sugar, wheat, coffee and cotton. He told of the advantages to be gained by membership in the exchange, and stated that its operations in Chicago were regarded as quite satisfactory, no less than 13 of the largest paper stock concerns in the Middle West having joined the Chicago branch, and the exchange in that city functioning in a highly successful manner.

Mr. Gair and Mr. Mauff then answered a number of questions regarding different phases of the exchange's operations asked by the paper stock dealers present, and an invitation was thereupon extended to any and all of the waste paper packers and brokers to become members.

Three responded, Atterbury Bros., of New York; the Lincoln-Melrose Company, Inc., of New York, and the Concord Paper Company, of Brooklyn. The announcement was made that the drive for members among the paper stock fraternity of Greater New York would be continued, and Mr. Gair closed the meeting by saying that he felt sure if the paper stock dealers would give the subject some thought they would readily see the benefits to be derived by membership in the exchange.

Mr. Mauff announced that two of the largest paper stock concerns in the West had just been added to the membership of the Chicago exchange, namely, the Pioneer Paper company, of Chicago, and the Detroit Paper Stock company, of Detroit, Mich.

The announcement also was made that trading by non-members on the New York Exchange would be continued for the balance of the week but that on Monday, October 29, none but members would be allowed to trade on the local exchange.

Development in Alaska

William G. Weigle, supervisor of the Snoqualmie National forest, whose headquarters are in Seattle, announces that plans are under way to establish two paper mills in Southeastern Alaska and also two new ones in the vicinity of Seattle, Washington, to utilize a portion of the enormous pulp resources of the two regions.

Mr. Weigle states that Colorado interests have dispatched engineers to the Shrimp bay region, near Ketchikan to survey sites for water power. California capital has engineers in the Thomas bay district near Petersburg, Alaska.

Alaska has much pulp wood timber and the government is putting it on the market as fast as surveys and values can be produced.

The Hartford Tissue Mills, Inc., have been incorporated at East Hartford, Conn., with an authorized capital of $100,000. The incorporators are Edward Dugan, 25 Norwood street, and others, all of Hartford.

New Developments in Paper Making

Waterproofing Paper

Paper from which containers, etc., are to be made are waterproofed as follows:

The paper is sized with an approximately ten percent solution of animal size, casein, or albumin at a temperature varying between 35 and 40 degrees C and after passing between press rollers either inside or outside the size bath, is reeled and allowed to stand for several hours to effect uniform distribution of the sizing material. Alkalies (for example, caustic soda up to two percent) or acids (for example, lactic acid up to 30 percent on the weight of the dry size) may be added to the solution to facilitate its absorption by the paper.

The hardening agent, which may be a solution of formalin (0.5 percent), alum, chromium salts or the like, is then applied to one side of the paper preferably by means of a roller, in sufficient quantity to harden the whole of the size, and the paper is again reeled and left for 24 hours.

The treated paper is then cooled in a current of air to prevent the formation of pores and hair cracks and is subsequently air-dried. This process is patented in British patent No. 201,463.

* * *

Hemp and Wood Fibers in Paper Pulp

The difference in the micro-structure of the various fibers is well brought out by applying Cross and Bevan's double staining method, using malachite green and Congo red. In making slides for examination a concentration of pulp of 0.02 to 0.03 percent was found suitable. The slide is examined both under ordinary light and under polarized light. A magnification of one hundred diameters is sufficient, but four hundred diameters should be available for confirmatory examination. Photomicrographs of characteristic hemp fibers under ordinary and polarized light and low and high magnification are shown.

The quantitative determination of the fibers was carried out under the low power magnification, the number of diameters and the fraction of a diameter of the field represented by each of the fibers being estimated in about 20 fields taken from each of three slides. When the percentage of hemp is fairly high (above ten percent) the results are sufficiently good for practical purposes. Full details of the methods are given.

For further information the reader is referred to W. Dickson's article in the Analyst, 1923, volume 48, pages 373-378.

* * *

Beating Problems

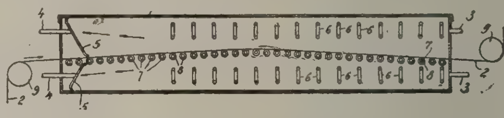
A paper was recently delivered before the Edinburgh conference of the Technical section of the British Papermakers' association on the subject of beating which brought forth a very interesting discussion. Among the points emphasized was the fact that certain tests have seemed to indicate that a wider spacing of the bars that is common gives a better turning beater and that this would be the tendency in future beater design. It was also shown that as far as the density of the stock in the beater is concerned, above eight percent density the power consumption increased and the rate of travel of the stock decreased. A considerable saving in power can be effected by tiling the beater. As far as the temperature of the stock in the beater is concerned it was brought out that a higher temperature was always obtained in concrete tubs than in metal, due to the lower radiation loss of the concrete.

There was also some discussion regarding the degree of beating attained in the beater. This is an important consideration, especially where the pulp is not made in the same factory in which it is finally converted into finished paper. The way in which the pulp is digested has, of course, a marked effect on how long it must be worked in the beater.

* * *

Paper Drying Machine

The accompanying diagram shows a paper machine which is patented in United States patent No. 1,469,048. The dryer is used for removing the moisture from webs of paper.



The dryer unit consists of a casing having passages at its ends for the entrance and exit of the web. Heating means are provided above and below the web of paper as it passes through the apparatus. Means are also provided for circulating air through the casing at the opposite faces of the web to be heated. A series of roller supports are arranged throughout the length of the casing on which the paper web rests while moving through the machine.

* * *

Combined Bleach for Sulphite Pulp

Experiments were carried out on the bleaching of a Rittner Kellner Sulphite pulp suspended in water which under normal conditions was bleached to a full white in from five to six hours, with the consumption of 3.2 percent of chlorine in the form of bleaching powder and a loss in weight of 3.5 percent. By passing the chlorine gas through the suspension of this pulp in water it was impossible to bleach to a full white. The absorption of chlorine was rapid at first, but after 2.5 percent of the chlorine had been absorbed further quantities of the gas passed through unchanged.

Greatly superior results were obtained by a combined chlorine and bleaching powder process whereby the pulp was first treated with chlorine water, then washed either with water or caustic soda lye and finally bleached with ordinary bleach liquor.

It was found advantageous not to use so much chlorine gas in the first treatment as was required to saturate the pulp, but to employ only 0.85 to 0.86 percent of chlorine in the form of chlorine water. Practically the entire quantity of the water used was absorbed to useful purpose. The pulp was then washed either with water or with a solution of caustic soda of one percent concentration. In the latter case the extract was dark reddish brown in color.

The secondary bleaching was performed with ordinary bleach liquor and the consumption of chlorine in this process required to produce a good white was 0.85 percent in case of the pulp washed with water and 0.58 percent where the pulp had been extracted with caustic soda. By using the combined method the total quantity of chlorine required to bleach the pulp could be reduced by 45 to 54 percent, as compared with the single bleaching powder process. *Papierfabrikant, 1923, pages 52 to 60.*

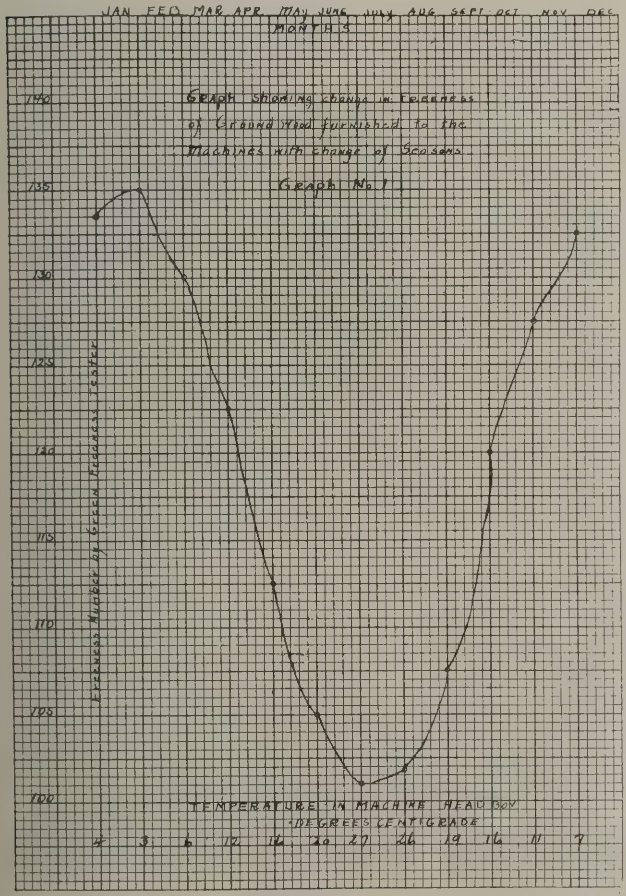
Control Methods in Grinding

(Continued from page 12)

No. 3 was made on Oct. 12, 1923, when nothing was being ground, all the pulp coming from storage and from cars from the Canadian shipper and the machines being furnished with stock at a freeness of 120-130. It will be noted that in Chart No. 3 the freeness was much less uniform, the control being more difficult.

From these three charts it can be seen that at different times of the year the groundwood furnished to the paper machines varies as to freeness, on May 4 the desired freeness being 100-110, on July 24 being 90-100 and on Oct. 12, being 120-130. This change in furnish is necessary because of the great change in temperature in the head box of the machine, the temperature varying from 3° C. in February to 28° C. in July, making a very great difference in freeness effect on the wire.

In Graph No. 1 can be traced the general trend of the desired freeness with the change in temperature caused by the change in seasons. There is no effort of course to hold the stock at some pre-determined point such as might be drawn up in advance but rather the effort is made to follow the machine conditions and provide as nearly as possible the stock that will run the best. This graph does not show exactly what we have done rather shows the general tendency of the fluctuations, the conditions of the moment determining minor irregularities of that moment.



Graph No. 1

The use of the hourly test is not only valuable as an aid to holding a uniform stock with the gradual changes occasioned by the seasons but is also an important aid in indicating and helping to hold quality with the grinding of inferior woods such as balsam, popple, and jack pine or with the reducing of the sulphite content of the paper. This test gives reliable facts in a numerical way so that when some change is made or some improvement is being developed in the handling of the stock a definite means of observation is provided.

The second angle from which the problem of control may be approached, the control of the individual stones producing the stock, is complicated principally by the very great difference in quality and properties of stones. This difference can hardly be appreciated until one has the opportunity of watching the performance of a group of stones by means of the freeness test. Although it might be readily accepted that different quarries would produce different products, but that stones from the same quarry and supposedly from the same ledge should be so different is rather astonishing. It is this difference that makes it so important to observe and handle the grinding units by the aid of some definite test such as the freeness test. If at some time an artificial grind stone can be made which will be uniform and standard, then it will be possible to standardize burring, grinding temperature, etc., with the expectation of obtaining a standard pulp.

There seems to be two general kinds of grinding surfaces—first, one in which the grit holds its cutting edge and gradually roughens until it is making a very free pulp and, second, one which does not hold its cutting edge but gradually falls off in production, continually making a slower pulp. Although the first kind of surface seems to be more prevalent in English stones and the second more prevalent in domestic stones, it can hardly be said that the holding of the cutting edge is typical of English stones. The point is that one can draw no general conclusions but must observe and handle each stone as an individual with its own particular properties.

The samples for the freeness test are taken from each grinder between seven and eight each morning by the grinder room foreman or under his direction so that he knows the conditions at the time of sampling, the test is made immediately

Beaters and Beating

Difficulty of Learning Just What Is Taking Place During Beating Operation—Hint of Invention by Author Reduces Time of Hydration 25 Per Cent

By C. E. YOUNGCHILD*

Paper Mill Superintendent, Nekoosa-Edwards Paper Co.

THERE are many kinds of beaters but the ones commonly used in the manufacture of pulp are the type I will touch upon in this paper. I use the word "touch" advisedly, because in a 10 or 15 minute paper I can even only do that but lightly.

Dr. Sigurd Smith in his new book on "The Action of the Beater" does the subject justice; but his book has over 200 pages of print as fine as that in a newspaper. In his preface he says in part:

"The complete absence of any theory of the action of the beater immediately made itself felt" when he was trying to design a small beater to do twice the work of existing designs. He says further:

"The complete inaccessibility of the actual beating zone renders it impossible to observe visually what takes place between the roll and the bed plate."

This difficulty has been experienced by all when trying to solve the problem of beating. It is a puzzle with no way of telling when it has been properly solved. In his foreword, he says in part:

"The beater, as the pivot of the mill, and the beating preparation of the fibrous raw material, as the paper making operation, are recognized as presenting a number of unsolved problems with the attraction of unrealized margins of advantage, both as regards quality, quanities of product in relation to raw material and cost of production, values of papers in relation to expenditure on account of power, labor and up-keep of machinery."

No one can dispute Dr. Smith in his statements in this work. It is common knowledge that the beating process can make or spoil stock and exercises a very marked influence on the character of the finished product. If the stock has not been properly beaten, it cannot be made into the required quality on the paper machine. It is therefore, a fact that "paper is made in the beaters" that is, for all grades requiring beating.

Some want their stock thin and others heavy consistency ——some want small beaters and others large ones—some call for quick action and large power use, while others think brushing and long time with small power use covers the bill.

Makers of beaters are a good deal like makers of paper mill machinery generally—they either don't know, or don't care to hurt the customer's feelings. They will usually make what is wanted, or claim their beater is a "cure all" for all ills. No two makers will make the same claims, however, for almost exact counterparts in construction except the name and paint on the outside.

My experience to be chronicaled here is with the Jones type of beater, 1600 pound size, as we furnish them, though I understood some mills furnish this same beater up to 2000 pounds dry weight. I have experimented with many types of fillings on various stocks; but chiefly on unbleached sulphite and sulphate, or Kraft stock.

Among the types of bars used were Helin, both wide and bar, all of them without the desired results. I have tried various speeds and bed plates but still without satisfaction, until, a little over a year ago, I tried a filling of my own design and it showed the best of any yet tried, using the North stone bed plate in conjunction therewith. Mr. B. T. McBain helped me with the idea and its application and together we have applied for a patent with report from the Patent office that all our claims have been allowed.

For reasons which most of you will understand, on account of foreign patent rules, I cannot put a copy of claims or picture of the filling in this report; but as soon as patent has been issued, I expect to make the other applications necessary and then will be pleased to have complete details made public. Suffice it to say, however, that on hard Kraft stock to test point for pound or better on the finished paper, my filling has shown hydration of the stock in 245 to 30% less time and with no greater power requirements.

I have eight such fillings in use now at Nekoosa and four at Fort Edwards. As fast as I can equip the balance of Nekoosa beaters, the work is being done. I find it to be of equal value on sulphite stocks. My filling can be put in any type of beater and the old bars now in use can be utilized. My improvement retards circulation some, still it increases the beating surface almost 100%.

The four beaters so equipped at Fort Edwards are of "Niagara" type and they show at 110 R.P.M. less use of power than those regularly equipped by the makers. My theory is a combination of hard and soft steel, by straight and shearing cut or brushing against a stone bed plate and this theory has worked out to the great advantage of the Nekoosa Edwards Paper Co. as the Manager and I, myself, see the results.

Our chemical engineer, Mr. Eagan, has made some preliminary tests to confirm these results and finds with the instruments he has that there is the difference in hydration claimed. Further tests are being made at Port Edwards between the old type of bar in Niagara beaters at J. E. mill and the new Alexander mill beaters of the same make. These tests were not completed at the writing of this paper; but after the issuance of the patent, will be made public.

I truly believe that there is nothing under the sun in pulp and paper making but what can and will be improved and that the beater is one place where not only the design but the method of operation has needed more attention than has been given them in most mills.

New Yellow Dye

The most recent development made in the dyestuff industry has resulted in the practical production of a lemon yellow shade of dye which will work level when used in tinting or dyeing. This is Sulphide or Wood Pulp Yellow G. N., and Bachmeier & Company, Inc., of New York and Boston, have the exclusive agency of this color. The usual high grade standard of all Baco products has been given this product, and all shipments are standardized before leaving the factory.

Baco Paper Yellow G. N. is in every way equal to its pre-war prototype and sells for a nominal price, considering its qualities and level dyeing properties. The dye produces that clear, bright, lemon yellow shade and tint which is in demand by the paper maunfacturers.

To all those interested and who desire a practical try out of this product, a trial tin or keg will be sent on approval upon receipt of requests.

Construction News

HOLYOKE, MASS.—The Judd Paper Co., has awarded all miscellaneous contracts for roofing and sheet metal work, plumbing, etc., for its new three-story and basement addition, 90x100 ft., now in course of erection, estimated to cost $125,000, and purposes to push the structure to completion. George P. B. Alderman & Co., 316 High street, are architects.

TROY, N. Y.—The J. A. Manning Paper Co., 68 George street, affiliated with the Manning Abrasive Co., has plans under way for the erection of a new one-story plant at Green Island, near Troy, estimated to cost about $350,000, including equipment.

NEW HAVEN, CONN.—The New Haven Pulp & Board Co., Greene street, has awarded a general contract to the Dwight Building Co., New Haven, for extensions and improvements in its plant, estimated to cost $21,000. F. L. Smith, 21 East Fortieth street, New York, is architect.

SAN FRANCISCO, CAL.—The Paraffin Companies, Inc., 40 First street, manufacturer of paraffin papers, box board and kindred products, has tentative plans under advisement for the rebuilding of the portion of its mills at Antioch, Cal., destroyed by fire, Oct. 15, with loss approximating $350,000, including buildings, machinery and stock.

EAU CLAIRE, WIS.—In connection with its new pulp and paper mill now in course of construction, the Dells Paper & Pulp Co., has plans for the erection of a new dam on the Chippewa river, for water power and hydro-electric service at the plant. It is expected to cost close to $1,000,000, with necessary equipment. Application has been made to the Wisconsin Railroad commission for permission to build.

PHILADELPHIA, PA.—The Earle-Parris Co., 41 North Eleventh street, manufacturer of paper specialities, has completed plans for the construction of a new addition to its plant at 123 North Eleventh street, including alterations and improvements in the present building.

JUNEAU, ALASKA—It has been definitely decided to construct and operate a new paper mill on Shrimp bay, Behm canal, to be devoted primarily to the manufacture of newsprint, and the project has been placed in charge of A. E. Millington, engineer, Denver, Colo., who will prepare plans and specifications at once. A company will be formed to operate the plant, which will be designed for an initial output of about 120 tons per day. The project will also include the construction of a hpdro-electric power plant for service at the mill. The estimated cost is placed at $750,000, including equipment. C. A. Millington and K. J. Carney, both of Denver, will be associated engineers for the work.

CHICAGO, ILL.—The Western Bag & Paper Co., 521 West Sixty-third street, has awarded a general contract to the Erickson Christiansen Co., 7219 Vernon avenue, for the erection of a new plant at 6354-58 Wentworth avenue. It will be two-story, 60x125 ft., designed for general operating and storage service, and is estimated to cost $35,000. Plans have been filed and work will proceed at once.

TOMAHAWK, WIS.—The Tomahawk Kraft Paper Co. has awarded a contract to the Wausau Iron Works, Wausau, Wis., for structural steel for the erection of a new digester building at its plant, estimated to cost in excess of $80,000, including equipment. It is proposed to lay foundations and commence work at an early date.

New Companies

NEWARK, N. J.—The Rowe-Williams Co., 520 Essex building, has been incorporated with a capital of $100,000, to manufacture stencil papers and kindred products. The incorporators are Joseph W. Rowe, H. Von Lengerke and Daniel A. Williams.

DALLAS, TEX.—The Southwest Tablet Mfg. Co., has been incorporated with a capital of $40,000, to manufacture paper

Pulp and Paper Exports

The regular report of the Canadian Pulp and Paper association states that the total value of the pulp and paper exports from Canada for September was $11,715,869. This was a decline from the previous month of $1,579,400 but an increase of $1,393,586 over September 1922.

Details of the various grades exported are given below:

	September 1922		September 1923	
	Cwts.	Value	Cwts.	Value
PAPER:				
Newsprint	1,591,145	$5,632,758	1,818,591	$6,870,190
Book Paper	4,675	37,759	5,199	40,948
Other Paper and Manuf's.		574,097		653,113
		$6,244,614		$7,564,251
PULP:				
Sulphate	270,053	825,789	234,439	761,695
Sulphite Blchd.	228,190	933,358	225,829	929,121
Sulphite Unblechd.	563,068	1,310,640	456,819	1,282,808
Mechanical	739,364	1,017,882	681,593	1,177,994
	1,800,675	4,087,669	1,598,682	4,151,618

The distribution of these exports in September was as follows:

	Paper	Pulp	Total
U. S. A.	$7,072,584	$2,954,723	$10,027,307
U. Kingdom	190,229	1,095,288	1,285,517
All Other	301,439	101,607	403,045
	$7,564,251	$4,151,618	$11,715,869

Exports of pulpwood in September amounted to 112,366 cords valued at $1,172,814 compared with 94,351 cords valued at $974,568 in September 1922.

For the first nine months of this year the value of the exports of pulp and paper has shown a considerable increase over the value in the corresponding nine months of 1922, the total being $104,636,736 compared with $83,792,893 for last year, an increase for this year of practically 25 per cent. Increases both in quantity and values have been shown in practically all grades of pulp and paper and these exports reflect the increased activity of the Canadian mills.

Details for the various grades are given in the following table:

	9 Months 1922		9 Months 1923	
	Tons	Value	Tons	Value
Newsprint	697,924	$49,689,864	839,222	$63,277,966
Book Paper (Cwts)	20,663	149,017	38,422	259,699
Bond & Writing (Cwts)	8,151	85,544	17,713	181,139
Kraft Wrapping	13,325	2,057,623	15,658	2,369,644
Mechanical Pulp	220,870	6,643,783	248,189	8,222,122
Sulphite Pulp	255,220	15,976,507	295,823	19,961,032
Sulphate Pulp	108,553	6,658,849	107,637	7,031,961
Total Paper		$54,503,754		$69,421,621
Total Pulp		29,289,139		35,215,115

British Empire Forestry Conference

The forest fire danger in its relation to reforestation is the point most strongly emphasized in the formal report of the British Empire Forestry Conference just issued as a review of the conference held in Canada this summer. The report deals at length with the great need for better fire prevention methods, reduction of waste in logging and sawmill operations, and application of more efficient methods of silviculture.

A most important recommendation deals with the establishment of "reserve forests" or clearly defined districts intended to remain as forests, where the arts of fire prevention and silviculture would be specialized. In other forests areas not so well suited for reforestation no attempt would be made to replant trees. Natural reproduction would be the method adopted.

The conference declared that the empire should be self-sustaining in its forest requirements.

Particular attention was paid to Canada, because of its vast forest areas. Fire control, says the report, must continue to play an important part in the protection of the standing timber, and forest officers must be clothed with power to conscript labor in times of special emergency.

The report strongly recommends use of the aeroplane as a medium for spotting and checking fires in the early stages. Subsidies are urged in favor of commercial air companies, sufficient to allow them to carry out forest protection work at rates which are within the means of the forest authorities.

The silvicultural possibilities of Canada are reviewed by provinces, and an abstract of the recommendations follows:

For Eastern Canada—Forest planting, supplemental to the more requisite intelligent management of existing forests. More attention to the hardwood problem.

For The Prairie Provinces—Extention of forest shelter belts on the prairie farms.

For Western Canada—More economical logging; protection of seed trees now imperiled by debris and waste matter following logging operations.

Almost coincident with the report, Robson Black, secretary of the Canadian Forestry association, told the Ottawa Rotary club of the danger of forest fire in relation to the forest policy of the dominion. He said that two men by carelessness had been responsible for the burning up, in a single fire, of sixty-six years' supply of timber for one mill and he added that, along the Montreal river, prospectors had destroyed twenty years' supply of wood for the mills of Ottawa.

Report to Forestry Conference

Timely warning of the seriousness of the present timber situation in Ontario and throughout the dominion is sounded in the reports of committees presented to the Second British Empire Forestry Conference, which made a six weeks tour of the forest areas of Canada this summer. A report of the proceedings and resolutions of the conference has just been issued by the Dominion government.

The matters brought up which particularly affect Ontario were concerned with forest fire protection, reforestation and State forest regulation.

It is indicated that at the present rate of use and destruction, the accessible areas of virgin softwood will not last 25 years. Since similar situation exists in the United States, and since that county is dependent on Canada for two-thirds of its newsprint, the committee on softwoods resources advises that Canada should take the necessary steps to conserve and augment its resources of growing coniferous timber. The need for the dedication of certain areas as reserved forests, containing within them "regulated State forests" is stressed by the conference.

The annual treking of timber and pulpwood cutters to the woods in the Fort William district has commenced, several of the larger concerns now having men and supplies on their way to the scene of operations. The Fort William Paper Company lately sent a large quota of pulpwood cutters to Yond, their principal camp, 172 miles west on the Grand Trunk lines to Sioux Lookout. The average wage paid is $45 a month and board.

(Continued from page 19)

specialties. The incorporators are V. A. Stovall and W. C. Fullilove, both of Dallas. Plans are being developed for early operations

New York, N. Y.—The Sunshine Folding Box Co., has been incorporated with a capital of $50,000, to manufacture folding boxes and other paper containers. The incorporators are M. Feinstein and H. Barshop. The company is represented by M. H. Mensch, 305 Broadway, New York.

Indianapolis, Ind.—The Indiana Shipping Container Co., 818 State Life building, has been organized by Harold R. Victor. The company will deal in corrugated and solid fiber boxes and other paper containers.

East Orange, N. J.—The Seacoast Paper Mills, Inc., has been incorporated with a capital of $5,000, to operate a paper mill. The company is represented by the New Jersey Registration & Trust Co., 525 Main street, East Orange.

New York, N. Y.—The Miad Folding Box Co., has been incorporated with a capital of $50,000, to manufacture folding boxes and other paper containers. The incorporators are I. Shumis and P. H. Weiss. The company is represented by William Kaufman, 1482 Broadway, New York.

New York, N. Y.—The Triangle Paper Co., has been incorporated with a capital of $20,000, to manufacture and deal in paper products. The incorporators are N. Engel and M. Kazdan. The company is represented by Konnoson & Konnoson, 170 Broadway, New York.

Financial

New York, N. Y.—The Bowater Paper Co., has arranged for an increase in capital from $150,000 to $200,000 for general expansion.

Covington, Ky.—The Crescent Paper Co., has filed notice of increase in capital from $10,000 to $40,000, for increased operations.

New York, N. Y.—The Holyoke Paper Products Co., Holyoke, Mass., has filed notice of organization to operate in New York with a capital of $100,000 and 2,000 shares of common stock, no par value.

The Lagerloef Trading Co., 52 Vanderbilt Avenue, New York, representing Norway pulp interests, has secured a decision in the United States Circuit Court of Appeals, Oct. 19, at Indianapolis, Ind., against the American Paper Products Co., Carthage, Ind. A judgment of $72,347.52 was allowed the plaintiff. The decision was based on a breach of contract; the Indiana company ordered a shipment of pulp through the Lagerloef organization, and after shipment, but before receipt, it attempted to cancel the contract. The lower court held for the defendant. The higher tribunal, however, holds that the contract was binding and so renders its decision. The amount originally asked was $45,000, but with costs and interests it has reached the sum awarded by the court.

German Paper in Brazil

On August 1 good hard-sized printing paper of German origin was being sold on the Rio de Janeiro market at £32 per metric ton, c. i. f., or about 25 per cent of the price asked for a similar quality of American paper, according to a recent report received by the Department of Commerce from Assistant Trade Commissioner Bernard H. Noll.

German doublecoated book paper, supercalendered, was quoted at £39 per metric ton, c. i. f., 90 days' sight or 120 days' date.

A large quantity of paper, declared as printing paper, was still laying in the custom house, awaiting a decision by the government as to whether the newspapers were to be allowed to continue the importation of paper declared as newsprint at the reduced rate applicable to newsprint and other printing paper to be used by them.

Newsprint for Nine Months of 1923

A report issued by the Canadian Pulp and Paper association states that the production of newsprint paper by Canadian mills during the first nine months of the current year amounted to 944,820 tons. This quantity is considerably greater than the total previously reached in any complete year with the exception of 1922, when the output was 1,081,364 tons.

In the corresponding nine months of 1922 the Canadian mills produced 799,373 tons, so that this year's output up to the end of September exceeds that for last year by 145,447 tons, or over 18 per cent. If the mills maintain this level of production during the last three months of the year, the output for 1923 will be well over 1,250,000 tons.

By far the greater part of the newsprint manufactured in Canada is destined for export and up to the end of September exports of this grade of paper amounted to 839,222 tons, or practically 90 per cent of the total production. The United States is naturally the chief market and 821,788 tons, or 97 percent of the total exports have gone to that country in the first nine months of the year. The remaining 17,434 tons have been distributed mainly to New Zealand, Australia and South Africa.

The following table shows the quantities exported to the various countries up to the end of September.

	Nine Months	
	1922	1923
Exports to;	Tons	Tons
U. S. A.	821,788	644,733
Australia	5,667	25,488
New Zealand	7,343	8,904
South Africa	3,168	6,019
Latin America	439	3,148
All Other	817	9,632
	839,222	697,924

The value of these exports in 1923 was $63,277,966 and in 1922, $49,689,864.

Newsprint exports this year have exceeded those for last year by 141,298 tons, or 20 per cent, while those to the United States were greater by 177,055 tons, or 28 per cent. Exports to other countries declined considerably from last year's figures, a decline especially noticeable in the case of Australia.

Barnjum Practically Gives Up

F. J. Barnjum, prominent Nova Scotia lumberman and noted conservationist, in a letter to the chairman of the Royal Commission on Pulpwood, explains his reason for not appearing before the commission during the Nova Scotia sittings.

He says that the Government has already "taken the means" to render the findings of the commission abortive should the commission recommend an embargo. Mr. Barnjum states that Premier King announced at the last session of Parliament that it was the government's intention to exempt farmers' and settlers' woodlots from the operation of the act to stop exportation should it be put in force by Order-in-Council. He also states that the government, in August, 1923, passed an order in council exempting for a period of ten years all wood exports under contract bearing date prior to June 1 from the provisions of any embargo that might later be applied under the authority which the government secured from parliament last session.

"The government tied its own hands, he says, "and the hands of your commission because, with the farmers, woodlots already exempt as described by the prime minister, and freehold wood under contract exempt by order in council, there remains practically no pulpwood which an embargo, if applied, could affect."

Official circles at Ottawa, however, say that Mr. Barnjum's statement is a misinterpretation of the facts in the case. It is stated that the underlying purposes of the whole series of events upon which Mr. Barnjum has commented, had the purpose of removing fears which were entertained in certain quarters that vested interests would be disregarded in the adoption of an embargo on pulpwood. The order in council of August 14 and the statement made by the premier in the House are explained as being two steps in a carefully considered policy.

Pulp Price Rising

As a result of the strike which curtailed consumption of paper by the New York dailies for some time a light overproduction of newsprint had developed, and the rumor was circulated that some of the Canadian and American mills might have to close down for one day a week for some time until the surplus was taken care of without any disturbance of existing prices.

The possibility of the Canadian mills having to take such a step has been eliminated, and the situation has been completely reversed as a result of the curtailment of American mills output owing to the water scarcity.

Reports have been received in Toronto that the supply of groundwood pulp has run out at many mills in Maine, New York and Wisconsin, due to continued drought. The mills affected are endeavoring to replenish their supplies in Canada and producers in Canada can sell all they can spare at $50 a ton, the rate having been advanced from $45 a few weeks ago. It is even said that $55 a ton has been offered.

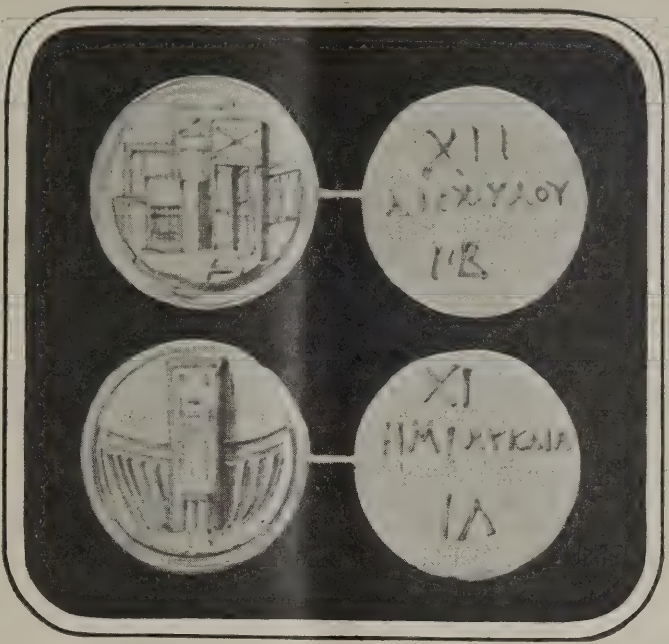
This situation is likely to create a demand for newsprint in the American market which will quickly absorb all the surplus in Canada and create a shortage in the near future.

New Ruling on Sales Tax

A synopsis of an important ruling as it affects the Canadian pulp and paper trade in relation to the sales tax has just been sent out to the members of the Canadian Paper Trade association by the secretary.

The new rulings provide that all licensed manufacturers will also be allowed to operate as licensed jobbers; on all purchases from licensed manufacturers or licensed wholesalers for re-sale, either in the same condition or after further processing, there will be no tax; on sales to other licensed manufacturers or licensed wholesalers there will be no tax; on sales to non-licensees, of goods of their own manufacture or production, they will collect a tax of 6 per cent on the invoice price; on sales to non-licensees, of goods other than their own manufacture or production, they will pay the government 6 per cent, based on their cost price, but will be under no necessity to show the amount on the invoice; licensed manufacturers or wholesalers are entitled to a deduction on all goods on hand of the amount of sales tax actually paid by them since May 19, 1920.

It is announced that the Foundation Paper Company has taken over the old Nipigon Fibre and Paper mills at North Bay, Ont., and that the intention is to place a large staff of men at work to get the plant into shape for early operation, presumably December 1st.



Two theater "tickets" of carved bone, from ancient Pompeii. The upper represented one admission to what we now call the gallery; the lower, a box seat.

—*Gandy & Gell's Pompeiana*

Admission: One Bone

The play was the thing, in ancient days as now. Good and evil, reward and punishment, guile and innocence, the whole worked up into a cross section of life, have held the same keen interest through the ages.

In Pompeii the crier announced the coming of the play. These days we read the advertisement in our favorite newspaper. Then, the scene was explained by voice; now, we refer to our program. Then, a slab of bone served a long life as a ticket; now, we print a new batch of pasteboards for each performance.

The play is still the thing, but its technique has changed. The modern play manager throws a good part of his burden onto paper.

Doings in Canadian Paper Field

Arguments Against Embargo

The bulk of the testimony adduced before the Pulpwood commission, appointed to investigate the advisability of imposing an embargo on exportation of pulpwood to the United States, continues against such a proposal.

A. J. O'Conner, manager of the Bonny River Lumber company, with head office at Bonny River, N. B., in his testimony, strongly opposed the embargo. He said he did not know of one farmer in the two counties of New Brunswick in which his company operates who favors the embargo. Those counties are Charlotte and Albert. He said pulpwood brought much more money into the country than lumbering. He pointed out the farmers in his section received eleven dollars per cord for export, and but five dollars per cord when sold to local mills. And then in some instances they had to transport the wood to the mills. He said the farmers would be at the mercy of the local mills if an embargo were imposed. In his opinion, the price per cord would drop to about three dollars. He believed that when new mills were established because of the embargo, there would be little remaining. In Albert county there were about seventy-five million feet of pulpwood. He said fields were now bearing spruce and fir pulpwood that a quarter century ago produced hay. The pasture lands of old are now showing pulpwood at ten thousand feet to the acre. And it is all excellent spruce and fir.

Cornelius Crawley of Cork, N. B., offered a petition signed by twenty six farmers of Cork against an embargo, and also strongly against an export tax. Mr. Crawley said the imposing of an export tax might be instrumental in reducing the price of pulpwood. He said ninety per cent of the pulpwood cut in his section was exported to the United States, where eleven dollars per cord was offered against from five to six dollars in Canada.

N. E. Hason of Fredericton, N. B. testified that it would be impossible for United States pulp and paper manufacturing concerns to secure pulpwood lands as most of the crown lands have been leased for long periods. He stated that the proper stumpage dues were not paid on crown lands in the province of New Brunswick, and added that this situation has always existed.

W. E. Golding, manager of the New Brunswick Railway company which is controlled by U. S. capital, was another who opposed an embargo. He said his company owned nearly two million acres of granted lands. He said if the fire menace could be controlled, there would be no fear of extinction of pulpwood. He believed it would be a sad error to impose an embargo on pulpwood as the United States would probably retaliate with a duty on sawn lumber, and would damage the lumber business of Canada greatly. He said if the embargo was imposed hundreds of farms would be abandoned, and it was desirable to keep the people on the farms in eastern Canada. Mr. Golding said his company owned about eight million cords of pulpwood. He suggested additional lookout towers and forestry police as means of curbing fires. He also pointed out that bud worm damaged timber could be sold only as pulpwood.

K. L. Golding, a pulpwood operator of St. George, N. B., expressed himself as opposed to an embargo. He said there would be no need of an embargo. He suggested six or eight aircraft as a fire patrol, and said there would be no worry about the supply of pulpwood if proper measures were adopted to limit damage from fires in the eastern Canada woods.

G. B. Jones, of Aphaqui, N. B., a member of the Canadian House of Commons, and A. F. Bentley, of St. Martins, N. B., a member of the New Brunswick House of Assembly, both denounced the embargo talk before the commission. Mr. Jones said he had yet to find one man in his constituency favor the embargo. He said the farmers in his section all have woodland practically all ship their pulpwood to the United States. He said it would be inadvisable to establish mills in his section, as St. John, N. B., was the most desirable site. He said he had gone through the constituency he represents in the parliament to find what sentiment exist there and found it strongly against an embargo. He said he bought pulpwood himself, mostly from farmers and shipped all to the United States, as the price offered by the Canadian companies was too small. If the embargo were imposed, the eastern provinces would suffer greatly, as there would be a large percentage of the farms deserted. In speaking of bud worm, he said the damage inflicted by this pest in his section was rated at about thirty three per cent. Forest fires during 1923 inflicted more damage than in any previous year.

Must Have Outlet for Wood

In his testimony before the Canadian Pulp Wood Commission Angus McLean, head of the Bathurst Company of New Brunswick, the largest producer of pulp and paper in the maritime provinces, expressed his opposition to an embargo on pulpwood exports as follows:

"My strong conviction is that such legislation would be a serious mistake and should not be enforced. So far as Nova Scotia and New Brunswick are concerned, there is a surplus of pulpwood. In this district it is going to waste and the prohibition of export would mean a still greater loss. There is no shortage in this part of the province. There is a surplus, and if the United States market is cut off it would be very serious to the farmers and dealers."

"They would have nothing but the local market, which would greatly depreciate the price of their product. If we developed to the limit of possibility so far as power is concerned, there would still be plenty of wood. There is not the power needed to manufacture paper extensively. All that can be made until we get additional power is pulp, and the only market for this is in the United States, where we have to compete with Germany and the Scandinavian countries, which are almost putting us out of business."

Facts About the Three Rivers Mills

The Three Rivers Que, plant of the International Paper Co. consumes 260,000 barrels of fuel oil per year. It had eight boilers and 32 burners with an oil storage capacity of 150,000 barrels. The boiler plant furnishes steam for running the paper machines, drying the paper, cooking sulphite and heating the mill.

The wood piles are said to contain 55,000 cords; the plant uses about 135,000 cords annually.

The filter plant supplies water for the process purposes, there being 20 filter beds.

The groundwood pulp mill has 14 magazine grinders, capacity 20 tons groundwood per grinder per day. The groundwood storage tank reservoir has a capacity of about 75 tons of groundwood pulp. The three digestors have a daily capacity of about 90 tons.

(Continued from page 17)

in the testing station and posted on the grinder room bulletin beside the chart of the hourly freeness at the measuring system and beside the chart showing time of last sharpening of each stone. The sampling and testing of the grinder stock at the beginning of each shift is good in a small mill but rather cumbersome and unnecessary with a large number of grinders.

To supplement his practical observation and knowledge, the grinder room foreman has before him with this method a numerical expression of the quality of the stock going to the machines, the quality of the stock from each stone and the time that each stone was last sharpened or dressed, and is in a position to handle the stones with the best possible results. The free cutting stones are sharpened with a finer burr than the others and if any stone is cutting very free stuff it is either run over lightly with a fine diamond, No. 12 or No. 14, or is dulled with a piece of iron. The stones which have a tendency to drop off in production quickly with a drop in freeness are sharpened with a coarse burr. With the object of keeping all the grinders making about the same grade of stock rather than having some running high and some low in freeness, the stones which have a tendency to roughen up are dressed to keep the freeness down and the stones which have a tendency to smooth off are dressed to keep the freeness up.

The grinding surface has so much more influence on quality than has temperature or pressure that nearly all the attention is focused on the stone surface. Although the temperature is reduced occasionally to bring the freeness down on some stone, in general the effort is made to hold it 50 to 60° C. The pressure is out of control because of the fluctuations in power and the grinding surfaces must sometimes be modified to hold the quality with changes in pressure.

The object in building up a system for controlling the grinding has been to avoid elaborate testing or complicated statistics but to have one simple reliable test by means of which the attention could be focused on the one important variable within control, the grinding surface. The kind of wood and the condition of the grinding surface are the things of primary importance, with the temperature, speed and pressure entirely secondary in importance in determining quality.

Dyeing and Tinting of Paper

(Continued from page 6)

backwater; the application of suitable mordants, such as the tannins, particularly in dyeing fiber mixtures, and the use of coal tar dyestuffs in conjunction with natural and mineral colors, such as iron ochres and artificial mineral colors, such as iron buff, chrome yellow, etc.

The effects upon the dyestuff absorption of prolonged beating, and of the degree of "hydration" of the fibers is at present still under investigation.

Very little information has so far been published on the dyeing of paper pulp, although a considerable amount of knowledge is probably available in paper mills.

There can be no doubt that reliable information should be of considerable value to the industry, but the directions in which investigations might be carried out are so numerous that, in order to obtain the most useful results, scientific investigators must in future look forward to the practical worker in the mill for useful suggestions.

Paper and Board

New York, November 6—It might be said that the market situation in paper and paper board at present is somewhat divided. On the one hand there is pronounced firmness, with quoted prices holding strong and with the tendency in an upward direction; on the other hand, there is easiness observable with some slight declines recorded and with the probabilities seeming to favor a further sagging of values.

In other words, there is a brisk demand for some kinds of paper, and a comparatively limited demand for others, with the result prices of those descriptions of paper which are moving actively are firm while quotations on those kinds which are not in such good demand tend to decline. Competition for business is exceedingly keen; perhaps this explains more than any other reason the easiness in prices in some quarters. Manufacturers are making every effort to secure as large a share of the available business in paper as they can with the idea in view of keeping their plants running at as close to capacity as possible, and with demand for certain kinds of paper failing to measure up to a volume where all the mills making such grades of paper can obtain enough business to warrant full production, it stands to reason some mills are shading prices in their drives to corral orders.

In newsprint, the market is very firm. The demand is so voluminous for print paper that mills not only are provided with a ready outlet for all the supply they are producing but could doubtless market additional tonnage if they had the facilities for increasing their output. Publishers are using newsprint at a record rate. So great is the demand for advertising space in the daily newspapers that publishers are obliged to omit many columns of advertisements from nearly every issue they print, because they are limiting the size of their issues owing to the paper situation.

Bag papers are firm, and so are most kinds of building papers. There is a steady demand for these products of sufficient volume to keep most mills busy, and competition therefore is not disturbing prices. The tone of book paper prices, however, could be much steadier than it is. The same is true as regards fine papers, wrapping and tissue papers, and box boards. The movement of such paper mill products into consuming channels is restricted. Buyers are operating on a most reserved scale, confining their orders to supplies directly and actually required, and since demand has not reached the dimensions most of those in the trade had anticipated for about this time there is a natural disposition on the part of manufacturers to grant price concessions when to do so results in the securing of orders.

The case of box boards is an apt illustration. Current demand for plain chip and news board is running at a rate about ample to keep mills in the East operating at 75 to 80 per cent of capacity. It is a well known fact that for a board manufacturer to realize a fair profit he necessarily must have his mill producing at very close to capacity; if production falls below such a level the overhead remains the same and the producing cost of each ton of board automatically rises, so that nearly all of the profit is eliminated. Under prevailing market conditions board manufacturers are not able to get enough business to justify full production, and in an effort to secure as many orders as possible so as to increase their output and thereby increase their rate of profit, mills are cutting prices in some instances to wean business away from competitors.

Quotations on box board have moved slightly lower. Plain chip is quoted at $55 a ton f.o.b. New York, and most mills are naming the same price on news board, though some are quoting $57.50 on the latter. Paper box manufacturers are buying in fairly good volume but not in heavy enough tonnage

to keep mills operating full. The result is that in some cases buyers are getting board a little below quoted rates

No definite changes of note have occurred in book paper quotations. However, consumers are placing orders at concession in some directions, especially in instances where large amounts of paper are concerned because manufacturers are willing to concede something in price if assured of ample business to keep their machines in full operation. Wrapping and tissue are quoted at previous prices but there is also some shading of quotations on these papers. Demand for fine papers is improving. Printers are absorbing larger amounts of bond and ledger, reflecting the increased demand for stationery from commercial houses, and quoted prices on these papers are fairly steady though the quotations named by different mills show some irregularity.

Mechanical Pulp

Not much change is noted in the ground wood market. Demand for this commodity is holding up on a fairly broad scale; if anything, there is not enough ground wood offered by producers in this country and Canada to cover the wants of buyers, and quotations are marked by a firm undertone. Domestic ground wood for prompt shipment is bringing around $42 a ton f. o. b. grinding plants, quotations ranging about $2 a ton on either side of this level and depending on the freight rate to consuming points and the air dry percentage of the pulp involved. Canadian producers are reported securing from $45 to $50 a ton at pulp mills, and are shipping a large proportion of their output into the United States. Most members of the trade are of the opinion that ground wood will hold firm in price now that the winter is coming on when the freeze up usually reduces the production.

Foreign and Domestic Chemical Pulp

Easiness is still apparent in chemical wood pulp. According to reports, demand from consumers has not as yet expanded, and buying is very spotty, some paper and board mills doing little or no purchasing at all and others coming into evidence as buyers only in an occasional way. Aside from business against contracts or back orders, it is doubtful whether there is a concerted movement in any one direction, and with sellers in at least certain cases having pulp they desire to market, it is but natural that prices display a softening tendency. Unbleached sulphite of No. 1 domestic and foreign quality is quoted at about 3 cents a pound at pulp mills or ex dock New

Domestic Rags

Most grades of papermaking rags are merely holding their own in price. Demand is of a character which fails to instill strength in quotations, and while dealers are generally maintaining asked rates they are accepting orders in some cases at less than what they ask. Roofing stock is probably as steady as any other class of rags. No. 1 roofing is selling at 1.50 to 1.60 cents a pound f. o. b. New York, and No. 2 packing is bringing 1.245 to 1.345 cents New York. Old whites are fairly steady, and so are thirds and blues. New cuttings tend to sag in price, especially such grades as white shirt cuttings and black cuttings which are in rather large supply and which paper mills are buying only in limited amounts. Quotations f. o. b. New York are:

New Shirt Cuttings,

Old Paper

Prices of old paper are sliding off at a rapid clip. There is little demand from consuming quarters which might be described as important, and the market seems to be weakening under its own weight. Shavings have eased off to 4 cents a pound f. o. b. New York for No. 1 hard white, and 3.10 cents for No 1 soft white shavings, and probably buyers are operating at less than these figures in some cases Old magazines are particularly weak in price. Offerings by dealers of flat magazines at 1.65 to 1.75 cents a pound New York and of No. 1 crumpled magazines at 1.35 to 1.45 cents have been reported, with few buyers appearing. Folded newspapers are down to $1 a hundred pounds f. o. b. this citp, and No. 1 mixed paper is freely offered by dealers at 70 to 745 cents per hundred pounds New York .Kraft paper is comparatively steady though some decline has occurred in this grade, sales at 2.10 cents a pound having been recorded. F. o. b. New York quotations are:

No. 1 Hard White Shavings	3.90	@	4.10	White Blank News.	2.10	@	2.20

Chemicals

Casein is said to have sold down to 14 cents per pound, duty paid, for the foreign product, representing a slight recession in price. There is a steady call for bleaching powder and quotations hold at around 1.50 cents a pound. Other papermaking chemicals are in routine movement with no changes of consequence recorded in quoted prices.

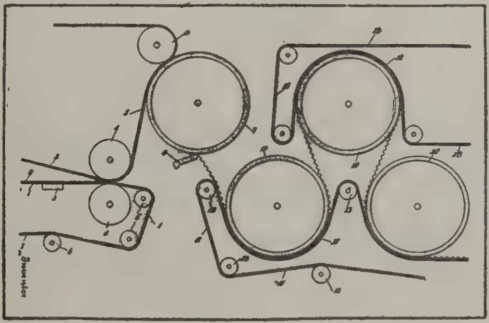
Improved Process of Creping Paper
The Best and Most Profitable

For the manufacture of CREPED PAPER Napkins, Toweling or Stretchable Bag Papers and Creped Packing or Crepe Wrapping Papers the system has no equal



The crepe being formed while the fibres are steaming hot and pliable is dried without stretching; not only retaining form better, but shedding less lint than cold creped paper products.

For particulars address:

Tompkins-Hawley-Fuller Co.
VALATIE, N. Y., or OREGON CITY, ORE.

CURRENT IMPORTS

IMPORTS AT NEW YORK

Week of October 29-November 3

Paper

Str. Bayern, Hamburg—C. H. Young Publishing Company, 266 rolls newsprint; Order, 70 bls. wrapping.

Str. Resolute, Hamburg—E. Dietzgen & Co., 4 cs. drawing.

Str. Mauretania, Southampton—A. C. Dodman Jr. & Co., 77 cs. hanging; J. C. Robold & Co., 1 cse. hanging.

Str. America, Genoa—Hensel, Bruckman & Lorbacher, 4 cs.

Str. Canadian Pioneer, Sydney—Order, 13 cs.

Str. Pittsburgh, Bremen—A. Frankan & Co., 3 cs.; C. G. Keferstein, 36 bls. wrapping; Standard Underground Cable Company, 5 rolls; from Southhampton—Columbian Company, Inc., 1 cse. cigarette; J. Hanheimer, 133 bls. filter.

Str. Rotterdam, Rotterdam—Republic Bag & Paper Company, 138 bls. wrapping; Pulp and Paper Trading Company, 86 rolls strawboard; F Euler Company, 11 cs. filter; American Express Company, 2 cs., Keuffel & Esser Company, 32 cs. drawing; W. Van Doorn, 71 bls.

Str. Verbania, London—W. H. S. Lloyd & Co., 19 bls. hanging.

Str. Asuncion de Larrinaga, Marseilles—Louis DeJonge & Co., 80 cs. writing.

Str. Port Albany, Liverpool—A. C. Dodman Jr. & Co., 19 bls. hanging.

Str. Randsfjord, Hafslund—H. Reeve Angel & Co., 11 rolls wrapping; P. Rudolph Company, 7 rolls wrapping.

Str. Clara, Trieste—American Exchange National Bank, 68 rolls newsprint; New York Trust Company, 2,331 bls. wrapping; Publicity Paper Corporation 70 cs. writing; Draeger Shipping Company, 1 cse. wrapping; Order 14 bls. printing.

Str. President Arthur, Bremen—J. P. Heffernan Paper Company, 109 bls. wrapping; Order, 144 rolls and 137 bls. wrapping.

Str. Albania, London—W. H. S. Lloyd & Co., 11 bls. hanging; H. Reeve Angel & Co., 13 cs. filter; F. L. Kraemer & Co., 5 cs. writing.

Str. Columbia, Glasgow—Standard Underground Cable Company, 138 rolls wrapping; Perry, Ryer & Co., 98 cs. printing.

Str. Volendam, Rotterdam—Republic Bag & Paper Company, 800 rolls wrapping; Pulp and Paper Trading Company, 78 rolls strawboard.

Str. Falls City, Hamburg—Irving Bank-Columbia Trust Company, 191 cs.; Publicity Paper Corporation, 180 bls. wrapping; International Acceptance Bank, 247 rolls newsprint; Mills Needle Company, 7 cs.; Order, 184 bls. wrapping.

Str. Byron, Constantinople—Order, 11 cs. cigarette.

ORR FELTS
and JACKETS

Lowest Cost per Ton

If you judge felt values, not by what you put into the equipment, but what you get out of it—then you will specify ORR 3 stripe Endless Felts for ORR felts will produce the lowest cost per ton. They "stand up" under severe usage. Orr durability is acknowledged everywhere. Their strength and long life are as dependable as their reliability and quality.

In the 32 grades of Felts and Jackets we can match your most exacting demands. Tell us the kind of paper you desire to make, and we will send you samples of felts that will economically serve you and help you to produce paper at lowest cost per ton.

THE PICKLES DRYING REGULATOR

Reasons why you should have it on your machine are: First, it regulates the drying of paper automatically, irregularities are eliminated; second, higher machine finished papers are attainable, because it is possible to maintain the proper quantity of moisture in sheet, as it passes to calenders; third, mills having tried it on one machine have ordered it for all their machines. Full particulars upon application to

Rubber Latex as Paper Size

Holland Technologists in Exhaustive Tests Reach Conclusions Opposite to the General Opinion of Paper Experts—A Paper Well Worth Careful Consideration

By A. van Rossem and W. Frenzyl

There have been quite a few papers and reports published within the last year or so on the use of rubber latex in the manufacture of paper and the advantages that may or may not accrue from this use. Not only American journals but foreign journals as well, particularly the English journals—for the idea of employing latex for this purpose was originated by the Englishman, Kays—have engaged in what may be called a scientific controversy regarding the value of rubber latex for paper manufacture. In the United States the opinion seems to be generally held that rubber latex has no future so far as the paper industry is concerned. The writer recently interviewed the executive officer of one of the largest paper concerns in the world and learned from him that after extensive investigations this concern had come to the conclusion that there was nothing to be gained commensurate with the cost by the incorporation of rubber latex with paper pulp and its manufacture into paper.

It would accordingly seem out of place to publish a translation of a paper on this much mooted subject. But this particular paper, which appeared in Papierfabrikant, 1923, 425-29, was written by two investigators who are connected with the Government Testing and Experimental Laboratory in Holland and its official character as well as the fact that the results have led to entirely opposite conclusions in favor of the use of the latex in paper manufacture have influenced the editors to publish it here in full. Whether this will reopen the discussion or not remains to be seen. At all events the dis- which is worth the careful attention and study of both rubber and paper technologists and executives.—Translator.

THE purpose of this investigation was to determine what effect, if any, the addition of rubber latex had on the properties of paper which was made from a pulp that had been previously mixed with the rubber milk in the manner of a size. The finished paper was examined to determine its resistance to folding, its tearing length, the elongation, the hygroscopicity, the degree of sizing quality and its writability or the ability of paper to resist penetration by ink.

The experimental investigations were carried out in the botanical laboratories of the Government Test-Bureau in Delft, Holland, and in part in the paper and cellulose laboratories of the Technical High School in the same city. Two series of tests were carried out, the second of which was used as a control of the first, so that checked results were obtained.

Making the Paper

Bleached sulphite cellulose was used in making the paper that was employed in these experiments. Rosin size and alum (papermaker's) were also used. Latex of standard quality was employed. A small experimental beater was available for mixing the pulp with the latex. One kilogram of the air-dried chemical pulp was beaten in 41 liters of water. The chemical pulp contained 7.8 percent of water. The concentration of the stock in the beater was accordingly 2.25 percent. After the pulp had been beaten for a period of two hours it attained a degree of hydration equivalent to 45-48 degrees on the Schopper-Riegler scale.

The following solutions were then prepared:

1. First, 45 grams of rosin size were dissolved in warm water and then diluted to make a volume of two liters.
2. Two hundred grams of sulphate of alumina were dissolved in two liters of water.
3. Latex containing 35.4 percent of rubber

and 20 cubic centimeters of a 20 percent solution of ammonia to the liter.

In making the papers used in the experiments three liters of the paper stock which had been beaten in the beater, thus containing 80 grams of absolutely dry chemical pulp, were in each case diluted with three liters of water and then further mixed under constant agitation with the requisite amount of the rosin solution or the rubber latex as above which was first diluted to one liter before use. After the mixture had been allowed to stand for fifteen minutes, so that the ingredients had become incorporated with one another, the requisite amount of the alum solution, first diluted to one liter, was added. After fifteen minutes the entire mass was diluted again to make a total volume of 25 liters and a sample of paper was made from the pulp to have a weight of from 55 to 65 grams per square meter.

The following different kinds of paper were made under conditions that were maintained as constant as possible, so that an equitable comparison of the properties of the papers was possible.

1. Paper which was not sized at all.
2. Paper made from stock which contained one, two and three percent of rosin size.
3. Paper made from stock which contained one, two and three percent of rubber latex.
4. Paper made from stock which contained one percent of rosin size and one percent of rubber latex.
5. Paper made from stock which contained two percent of rosin size and two percent of rubber latex.
6. Paper made from stock which contained three percent of rosin size and three percent of rubber latex.

In every case, with the exception of the paper in which no size at all was used, an equal amount of sulphate of alumina was added. This was 10 grams of sulphate to 80 grams of the chemical pulp. This is a decided excess in comparison with the amount of rosin and rubber latex used in making the paper.

Testing the Papers

The various papers that were made in this manner were tested under conditions that were maintained constant throughout the research. The results included in the tables that form a part of this report are the averages of at least five separate tests in each instance in most cases of ten individual observations. Tables A. B. and C are given below.

The results are shown in graphical form in figures I to V inclusive. These graphs afford an idea as to how the properties of the paper are affected by the use of rosin and rubber latex.

The tests were carried out in the usual manner. Only the following special points need to be mentioned. The impression of the screen or wire was clearly evident in the various paper samples. The testing strips which were used in making the tearing

TABLE A

Unsized paper with one, two, three and six percent of rubber latex in the stock; (55 to 65 grams per square meter).

Rubber in percent	Double folding test	Tearing length (on absolute dry material in meters)	Elongation in percent	Moisture in percent	Sizing quality	Writability
0	34	5435	4.0	6.9	none	none
1	26	4921	3.7	6.3	none	none
2	45	5063	4.4	5.9	slight to none	none
3	51	5092	4.1	5.4	slight to decided	moderate to good
6	106	4988	4.6	5.7	decided	good

TABLE B

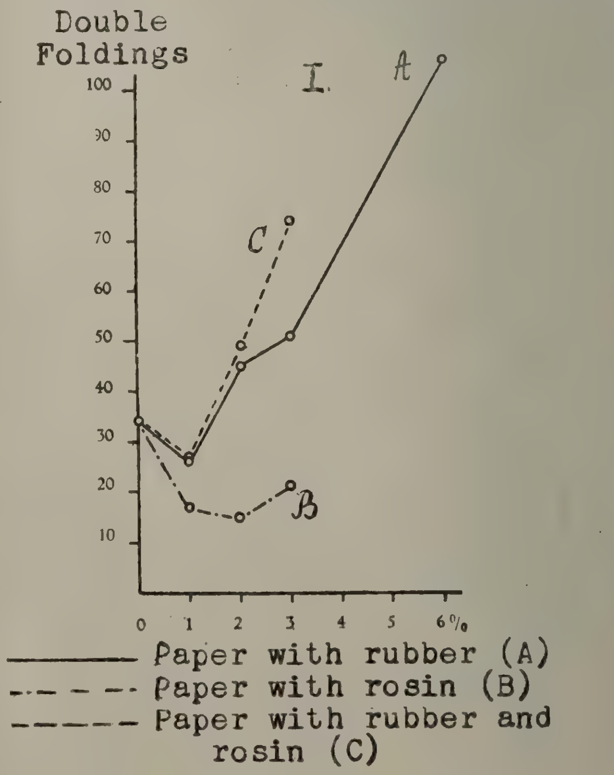
Paper without and with one, two and three percent of rosin size, but without any rubber latex; (weight 55 to 65 grams per square meter).

Rosin in percent	Double folding test	Tearing length (on absolute dry material in meters	Elongation in percent	Moisture in percent	Sizing quality	Writability
0	34	5335	4.	6.9	none	none
1	17	4488	3.4	6.8	slight to none	none to moderate
2	15	4345	4.3	6.1	slight	moderate
3	21	4164	4.4	6.3	decided to slight	moderate to good

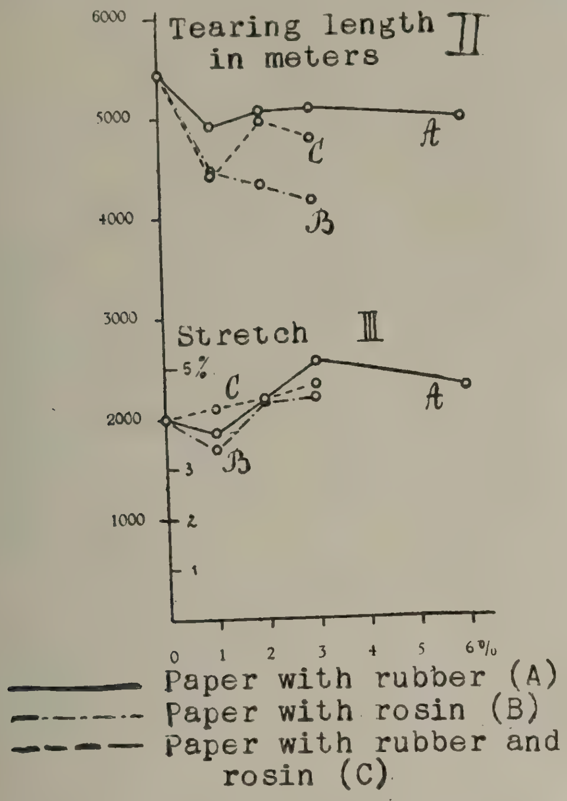
TABLE C

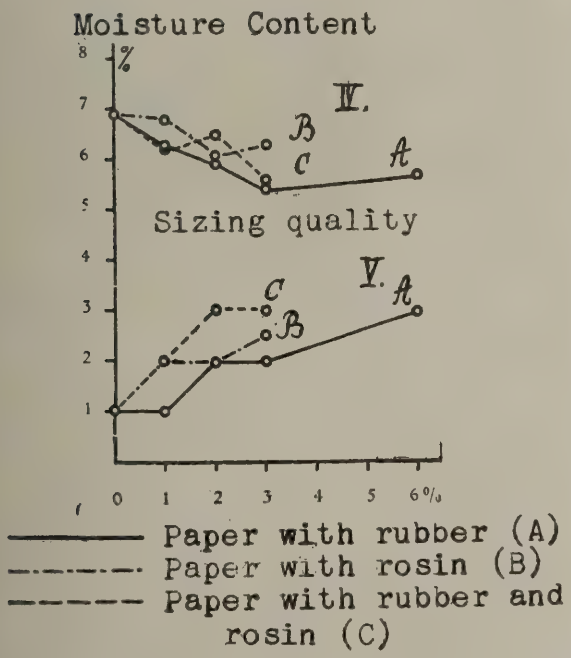
Paper without and with one, two and three percent of rosin size and one, two and three percent of rubber latex; (weight 55 to 65 grams per sq. meter)

Rosin in percent	Rubber latex in percent	Double folding test	Tearing length (on absolute dry material) in meters	Elongation in percent	Moisture in percent	Sizing quality	Writability
0	0	34	5435	4.	6.9	none	none
1	1	27	4423	4.2	6.2	slight	none to moderate
2	2	49	4969	4.3	6.5	decided	moderate to good
3	3	74	4786	4.7	5.6	decided	good



test were accordingly cut in the direction of the narrower dimension, in order to avoid having deeply impressed lines in the sample of paper which would materially affect the accuracy of the tearing test. In making the folding tests with the Schopper folder errors may be readily introduced into the determinations in this way. In order to avoid this the samples of paper were cut at an angle of 45 degrees.



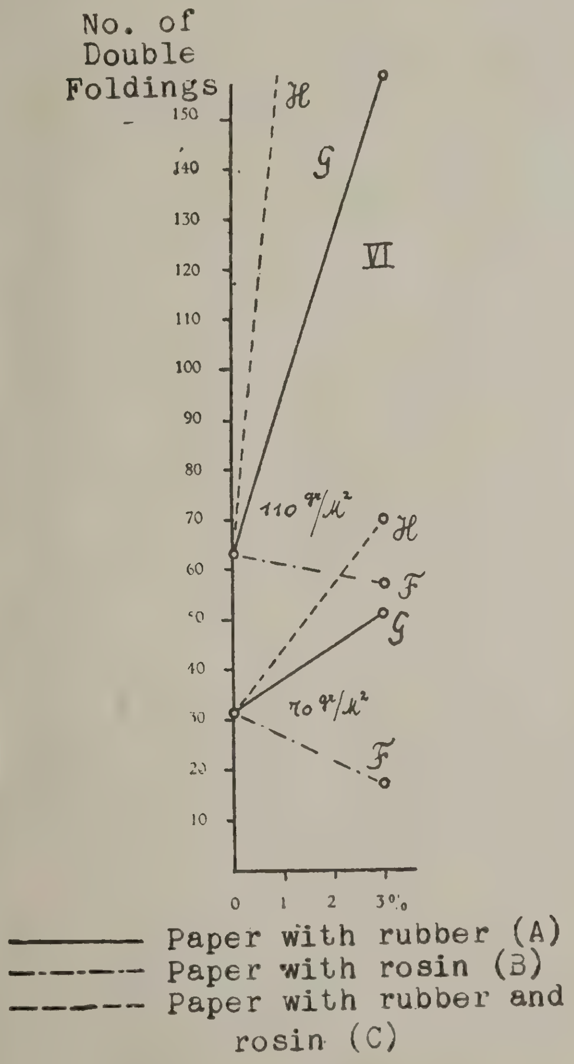


Discussion of Results

A comparison of the results obtained in the three series of experiments which have been described in detail above, will readily show the effect the addition of rubber latex produces in the finished paper. In each case a sample of paper was made without the addition of rubber latex or other sizing from the sample chemical pulp and under the same conditions. This makes it possible to tell exactly what effect is produced in the paper by the addition of the latex.

In examining the results in the tabulations under the column headed "double folding test," it will be seen that the addition of latex in proportions of over one percent has a marked effect in increasing the number of foldings that the paper will stand without tearing. On the other hand, in Table B it will be seen that the addition of rosin size has a decidedly unfavorable effect on the strength of the paper as indicated by this test.

The net conclusion that may be drawn from this part of the experiments is that the resistance of the paper is dependent on the inherent properties of the paper fiber, but that it is favorably affected by the addition of ruber latex to the paper pulp. On the other hand, when both rosin size and rubber latex are added to the paper, while the strength of the paper is increased, this increase is considerably less than where rubber latex was used alone. In other words, rubber



latex is far more suitable for increasing the strength of paper than rosin size.

When it comes to the consideration of the tearing length, another condition applies. Owing to the fact that the weight of the paper is increased by the addition of rosin and rubber latex, the tearing length is somewhat reduced by the addition of these materials. However, this decrease is less in case of the rubber latex than in that of the rosin size. This substantiates the conclusion that the strength of the paper is primarily dependent on the character of the paper fiber. It must, however, be remembered that this test is not an absolute measure of the real strength of the paper, for in arriving at the results which are given in the tabulations, consideration must be given to the weight of the paper. The increased weight, due either to rosin size or rubber latex, does not connote a correspondingly great increase in the strength of the paper as determined by this test.

As far as the elongation at the point of rupture is concerned, the addition of rosin size or rubber latex is unimportant. The results show that there is very little difference between the various papers tested. The reason for this is that this property of the paper is almost solely dependent on the character of the pulp fibers from which the paper was manufactured.

The hygroscopic properties of the papers, that is their ability to absorb moisture, are not affected in any appreciable way by the addition of the rubber latex in accordance with the results given above.

Rubber latex, on the other hand, has not so strong an effect on the sizing quality or ability of the paper to retain ink writing as rosin size. This may have been expected for rosin size is known to be the most effective of all sizing agents. However, when rubber latex is used in comparatively large amounts, which are greater than is necessary to produce good sizing properties in the paper in the case of rosin size, a sufficiently well sized paper is produced. But the increased cost of the paper will not compensate for any advantage that may be gained. Hence, it does not appear likely that rubber latex has any future as a sizing agent for paper in the place of rosin size.

Second Series of Tests

In order to substantiate the aforementioned results and also to act as a control, a second series of tests was made in the following manner.

It was thought desirable to use a paper which was stronger than the paper tested in the first series, as indicated by the folding test, as in the second case the variations of the individual results from the average value would be greater. Furthermore, in order to determine if the size had any effect on the flow of water through the wire, the degree of beating of the paper stock from which the paper was made was determined.

In making the paper the stock was beaten until it showed a beating degree of 62 on the Schopper-Rieglar scale. Four liters of the beaten chemical pulp were then diluted in each experiment with 30 liters of water and from this density of stock the sample of paper was made. This was done in the way generally employed in making handmade paper samples. The samples were transferred to a felt and dried. The air dry weight of the paper was between 70 and 110 grams per square meter.

The sizing material was added to the stock before it was diluted. Sulphate of alumina was added to the stock until the liquid just reacted acid to litmus paper. The rubber content of the stock was accordingly plus or minus three percent on the weight of the dry stock.

Four different samples of paper were made. First, an unsized paper was made containing neither rubber latex nor rosin size; then a paper with three percent rosin, another with three percent of rubber latex and finally one with both three percent rubber latex and three percent rosin size.

These papers were then examined in the same manner as has been described in the first series of experiments. The results that were obtained are given in the following tabulation:

	Number of double foldings		Tearing length (absolutely dry wt.) meters	Elongation in percent	Moisture in percent	Sizing quality	Degrees of beating
	at 70 gr. per sq. meter	at 110 gr. per sq. meter					
D. Unsized paper	31	63	6180	2.1	8.6	none	23
F. Paper with three percent rosin size	17	57	5790	2.2	7.1	decided	28
G. Paper with three percent rubber latex	51	139	571	2.3	7.8	moderate to decided	3
H. Paper with three percent rosin size and three percent rubber latex	70	509	6510	2.6	7.6	decided	29

The paper stock used in making these papers was Ia bleached sulphite pulp.

Discussion of Results

A general comparison of the results obtained by testing papers A, B and C with those of papers F, G and H shows that the conclusions which were drawn in the first instance are substantiated by the second series of experiments. The addition of rosin size and of rubber latex seemed to produce the same results in the case of the heavier papers of the second test that were observed with the lighter papers of the first test.

The conclusion that the strength of the paper is dependent for the most part on the character of the fibers of the pulp from which it is made and only to a secondary degree on the sizing or rubber latex that is added to it is emphatically substantiated by the results of the second test.

As far as the degree of beating is concerned, the addition of rosin effects an increase of from 22 to 30 percent and this increase is somewhat greater when rubber latex is used. In other words, the addition of these materials retards the flow of water through the wire.

The addition of latex to paper pulp has a marked effect on the properties of the paper that is made from this stock, even when the latex is added in the small proportion of two percent. This influence is most marked on the number of double foldings that the paper can be subjected to without tearing, on the tearing length and on the elongation at rupture. It is much more favorable in comparison with the action of rosin size on the paper. It should be mentioned that the rubber content will be smaller in air dried papers. The hygroscopicity of the paper is somewhat reduced by the addition of rubber latex. On the other hand, the sizing quality of the latex paper and its ability to hold ink are not so good as when rosin size is used.

There are, of course, quite a number of questions that remain unanswered and quite a number of problems that remain to be solved as, for example, the surface sizing of paper with latex and the results that are obtained thereby: the effect of the latex on the fastness of the color of the paper, on its fastness to light, the life of the paper, its resistance towards atmospheric influences, and on the change in the properties of paper in drying or calendering when rubber latex is added to it. All of these problems are being investigated at the present time in the Delft Institute and the results will be published later.

Determination of Latex in Paper

This piece of work was carried out in the Government Laboratories for Rubber Research in Delft, Holland, and is important in having evolved a method which can be used to good advantage in determining the proportion of rubber in paper.

Three paper samples were taken. One paper contained neither rubber latex nor rosin size, the second paper contained three percent of rubber latex calculated on the dry weight of the paper, and the third contained three percent latex and the same proportion of rosin size.

After the samples were weighed they were subjected to extraction with acetons for a period of ten hours. This was for the purpose of removing the rosin. Then the extracted paper mass, without preliminary drying, was extracted with benzol. To accomplish this the paper must be left over night in a quantity of benzol. Then the benzol solution was boiled in a flask provided with a reflux condenser for two to three hours. The benzol was then evaporated and the residue weighed. Then the paper mass was extracted again and the solution was evaporated to five cubic centimeters and mixed with one hundred cubic centimeters of alcohol. In this way no coagulation took place, but a finely divided mass was obtained, which was filtered over asbestos and then dried and weighed.

The first extraction with benzol in the second sample of paper gave a result of only 1.04 percent. As the possibility of the extraction being incomplete had not been excluded, the extraction was repeated four times. The results which were obtained by evaporation and coagulation are given in the following tabulations.

TABLE I

Benzol extraction of paper (after extraction with acetone).

	Percentage of rubber in paper found by Evaporation	Coagulation
One extraction	1.04 percent	1.04 percent
Second extraction	0.63 percent	0.24 percent
Third extraction	0.38 percent	0.03 percent
Fourth extraction	0.12 percent	0.00 percent
Total	2.17 percent	1.31 percent

From these results it will be seen that after two and even three hours' digestion the extraction is still incomplete and it is only after the fourth extraction that all of the rubber is removed from the paper fibers. This behavior of the rubber latex paper is entirely contrary to what might be expected, as the rubber is present in the paper in a very finely subdivided state and it is to be supposed that rubber in this condition would easily dissolve in the solvent.

For this reason the paper sample 3 was digested twice with benzol, the digestion lasting eight hours each time. This seemed to be sufficient, as the second digestion removed less than 0.1 percent of rubber from the paper fibers.

The results of the second test are given in table II. Three different papers were analyzed.

TABLE II

Determination of the percentage of rubber in latex paper

	Paper sample without rosin or latex	Paper sample with latex	Paper sample with rubber latex
Acetone extract in percent.	0.7	0.7	3.1
Total benzol extract (evaporated) in percent.	0.03	2.2	2.7
Total benzol extract (coagulated) in percent.	0.0	1.3	2.1

From these results it is clear that in the second case, paper made with three percent rubber latex, 2.2 percent was found by analysis, 0.8 percent being lost in the water used in beating the stock. In the paper where both rosin and rubber latex were used, 2.7 percent rubber was found, indicating a loss of 0.3 percent of latex. It is also easy to see that more accurate results are obtained by the evaporation method.

Harvey Paper Products Co. Expending

The Harvey Paper Products company has established a plant in Monroe, Wis., for the manufacture of paper baking cups, finger bowls and bon bon cups. Extension of the business is planned to include many other paper products.

The plant was removed from Waukesha, Wis., and is one of six branches making such products, three other branches being in Milwaukee.

Problems of the Paper Merchant

Western Man Discusses Business Conditions in Paper Field and Shows Necessity for Close Co-operation between Manufacturer and Merchant

By J. A. Carpenter*

President, Kansas City Paper House and Vice President, National Paper Trade Association

WHEN Lloyd George arrived in New York last week, he said in practically these words—"This is certainly God's country."

When I look around at the evidences of prosperity of the gentlemen sitting in front of me, this goes through my mind: Is this prosperity that I see the results of 1918 and 1920, or is it the results of the business of 1923? How much of this prosperity was made on paper and how much of it is money in the bank?

There are three classes of people in business in the paper line of both manufacturers and merchants:

1—Those who are handling their business in a promiscuous fashion, meeting and cutting prices of all their competitors, not knowing where they are going and where they will end.

2—Those who have a semi-cost system, a semi-business policy but that take a lot of business they know in the bottom of their hearts that they are not getting any money on.

3—The man who knows his cost, has a fixed price, a fixed quality of merchandise and a line of customers who want this class of business.

Which class are we in, each one of us?

Necessary to Get Together

The paper business as I see it today is in a good deal the same condition as almost every other business. Very few of either manufacturers or merchants are making very much money. The executives get a monthly sheet showing the amount of business done and they are rather pleased at the amount of sales. They next look at the profit column and their faces drop. Then they look at the cost of doing business and they are very much surprised, although they saw practically the same figures last month.

Gentlemen, what are we going to do to remedy this?

My idea is that the one solution is more such meetings as we are having today. Get closer together; know each other's troubles; strive to work them out in a way that will be a help to both the manufacturer and the merchant.

The situation in the East so far this year seems to have been very much more advantageous than it has been in this territory. Labor is practically all employed at high wages. The demand for a better class of goods has been fair and money has seemed to be fairly plentiful. This condition has not prevailed in the Central West for several reasons.

The Far West, I think, has fared better than the East or Central West. As I understand, statistics show that there are 5,000 people landing in California every morning, and suppose every one of these people carry only $100 with them to spend; it means a half million dollars a day. Is it any wonder they can sell butcher's manila and fine papers at prices which seem very high compared with eastern prices? We would all be inclined to think this would be a wonderful place to be, but I understand that they have their troubles as well as we do in our localities.

So let's see if we cannot work closer together, the merchant and the manufacturer, whereby we will both receive a reasonable return on our investment and a reasonable compensation for the labor put into the paper business.

I think you would all be interested in hearing the results of a questionnaire sent out to 100 representative merchants of practically all sections of the United States. These answers give a bird's-eye-view of the conditions of the paper merchant in reference to stock on hand, his ideas as to future market conditions, and the outlook for business in his particular territory. First, I will read the questions and then the answers:—

1. Have you placed your orders with the mills covering your requirements for the next—

(a) 30 days	35
(b) 60 days	48
(c) 90 days	16

2. How are your stocks as of October 1 in relation to last year of the same date—

Larger	33
Smaller	16
About the same	51

3. What is the outlook in your territory for the paper business this fall?

Fair	78
Very Good	21
Bad	1

4. What are your ideas as to the paper market for the fall months?

Declining	30
Firm	68
Advancing	2

Some of the Merchant's Troubles

It has been brought to the attention of the merchants by the Cost department of the National Paper Trade association, and this applies from coast to coast, that 35% of the orders received every day are for $5 or less and 60% of the orders that are received every day are for $10 or less. The former cannot begin to pay the expenses of handling and the latter will just about break even. When you understand the expense of doing this part of the business which is, of course, all done out of the warehouse, which represents at least 80% of our capital investment, you can readily understand that this is a serious situation.

These are some of the things that make it very essential that the national associations of both manufacturers and merchants work closer together than ever before, particularly for the reason that there does not seem to be much opportunity of reducing the expense of doing business. As we know each other's business better, we can work in more perfect harmony. In fact, that is the very object of having meetings like this one today. None of us want to go on record as going backward, so let's push ahead for better things in the future.

I would like to present briefly some of the difficulties that confront the paper merchant today, and I know our members present will be pleased to hear any suggestions from the manufacturers as to how these difficulties may be overcome.

---

*Read before Joint Conference at the Fifth Annual Fall Business Conference of the American Paper and Pulp Association, Chicago, October 8 to 11, 1923.

One of the problems confronting the wrapping paper merchant is—

(a) How are we going to take care of the 250 tons of Kraft that is coming in on us from the new mills that are just starting?

(b) How can certain manufacturers reconcile themselves to the policy of certain mills which are carrying warehouse stocks in various distributing centers? Is this not a direct usurping of the legitimate functions of the paper merchant?

Let me point out clearly that we have no quarrel with any particular mill whose policy is to sell direct to the consuming trade, but only with those who are supposed to distribute their product through the legitimate paper merchant. These are some of the things that the merchants meet today, that makes us wonder who our friends are and who we should give our car load orders to.

The improved condition of the farmer which has occurred in the past two weeks makes it look as though they were very much better off than they thought. As I understand, they will receive about 22% more for 1923 crops than in 1922. This being the case, why should not the paper manufacturers and merchants have a very much better year than 1922?

Do you know of any paper merchant or manufacturer who will make twenty-two per cent more than last year? If you do, trot him out; I don't know where he is.

There are some other things that I think look encouraging even to the paper merchant for the balance of the year. I think the demand, the amount of money the laborer (and believe me, we are all laborers, too) is going to have to spend for Christmas, is good. There is not a man in this room but will make a better Christmas present to his wife this year than last, and it is going to take some paper to wrap them up. It is going to take a lot of paper to do the advertising, and it looks as though the prospects for the paper business are in pretty fair shape.

Paper Makers' Felts*

Importance of Selecting Proper Stock and Care Required in Making Points in the Care of Felts in the Paper Mill—Some of the Causes of Felt Failures

By A. H. THEURER
Superintendent Appleton Woolen Mills

ONE of the most important phases in the manufacturing of machine clothing satisfactory for the exacting requirements of the paper industry, is the selection of our raw wool stocks.

Our problem is somewhat simplified in that we use no cotton or wool substitutes such as shoddies, noils, garnetts or waste of any description, confining ourselves to straight, virgin wool.

While wool is wool, there is a vast difference in various types grown, each having its own characteristics. It may interest you to know that different kinds of soil as well as varying climates in different parts of our country alone, affect the color, elasticity, and general working properties of the wool.

For instance, wool grown in Wyoming has a much brighter color than wools grown in many other states because of the soil and is especially desired by knitters. Wools grown on cut-over land from some sections are not as choice as they might be because the fleece becomes more or less loaded with burrs and other vegetation while the sheep ramble through the brush. Wools of another section have the characteristic spiral burr which to the felt maker is very objectionable in that each individual burr breaks into a great many small pieces during the carding process and is spun into the yarn as it cannot be satisfactorily removed. Many wools from still other sections are more stained in character, while the best domestic wools come from the central western states.

Requirements for Felt Making

The principal characteristics which a good felt wool must possess are:

1. Length of Staple—The strong, coarse yarns require the longer, coarser stapled wools such as are used in the manufacture of wet machine felts, while medium grades of felt require a shorter and finer staple and the fine super grades a still shorter and finer stapled wool.

2. Strong, healthy Staple—Sometimes defective wools are offered which have a weak spot in the staple, indicating that the wool came from sick sheep. The so called cotted fleece is another result of sickness in the sheep which causes the wool to become matted together and unfit for felt stock. It is such defective wools as these that we are careful to eliminate in the selection of our stocks, using only the strongest staple obtainable.

3. Evenness of Staple—Inasmuch as many different sorts can be made from one fleece, you may know how carefully the wool must be sorted, for to obtain a strong, even yarn, free from lumps, the wool used in that particular yarn must be of uniform length.

4. Elasticity—The earlier or lamb wools are not only somewhat kempy but have coarse tips and not enough blood or character, are not as elastic, and do not possess the proper fulling qualities essential in felt yarns, while other wools seem dead, possessing no loftiness or elasticity of any kind. To use such wools as these would be the height of folly.

5. Free Wools—That is, they must not possess spiral burrs or an undue amount of chaff as this vegetable matter can only be removed by carbonizing. This process, however, makes the wool harsh and much less desirable for felt requirements. This is a very common characteristic of Australian, South American, and some other types of foreign wools.

6. Color—Good white wools are always preferrable to stained wools as the latter do not make as presentable a felt and are also apt to be weaker in staple. Therefore, in manufacturing each different grade of felt, we must select only such wools as are best adapted for the different grades of felts. Thus, by always buying the best grades of wools grown, we never find it necessary to hold any post mortems on account of off grades of wools which we thought we might have slipped through as a cheapener.

---

* *Read before Superintendents association at Papermakers' convention, Appleton, Wis., Oct. 25-27, 1923.*

Having selected and graded our wools, our next care is to remove all animal oil or grease, sand and dirt, from the wool in order that it may be properly processed. This is done by scouring in a liquor especially prepared for this purpose. Care must be used for if the bath is too strong, the wool will become tendered and if too hot, become harsh, losing much of its elesticity. This is also true if dried at too high a temperature. If the stock is agitated too much, it becomes matted together, producing most unsatisfactory results in subsequent processes.

Following the scouring, the wool must be blended, that is, certain wools must be mixed together so as to obtain the blend best suited for the particular grade of felts into which this yarn will go. In picking this blend, the mix is treated with a soluble oil so as to make the fibers more pliable and elastic, preventing the breaking of the staple in the following process.

Manufacturing Processes

The carding of wool consists of a series of combings, the purpose of which is to comb out the wool fibers in order that they may be paralleled as much as possible. It is very necessary that this work be very carefully and thoroughly done in order that the ends be all of uniform size and properly condensed. Each set is carefully weighed and must not vary over three grains on each fifty yards tested. Unless the stock is properly carded, it would be practically impossible for the spinning department to obtain the required effect in the yarn. As the ends come off the card they are wound on jack spools and then ready to be spun.

In spinning, the work is done on machines containing 360 bobbins, each bobbin taking care of one end from the spool, winding the yarn onto itself, immediately upon each draw receiving the required amount of twist. The twist of yarn is of the utmost importance, determining to a large extent the amount of stretch in the felts as well as the finish to be obtained. To secure a hard, strong yarn such as certain kinds of felt require, the yarn must be twisted all it can but not beyond the point of cracking. On the other hand, if a good soft, heavy cushion nap is needed, less twist must be put in, in order that we may properly raise the required amount of nap. The yarns are also tested for elasticity and breaking test, as each yarn must come up to a certain standard test which we have determined as most satisfactory for each size of yarn made.

Following this process, the yarn is prepared for the weaving, being spooled onto large spools from which it is wound off onto the beamer in warp lengths and then transferred to the beams. Great care must be used to maintain proper tension in beaming in order to avoid any slack or tight ends, either of which would cause defects in the finished felt. After the ends are drawn through the heddles, mounted on harness frames which control the pattern or weave and through the reed which maintains the proper position of the threads while weaving, the job is mounted in the loom, ready for weaving.

The weaving of the felt requires the very closest kind of attention, in order to insure the proper texture at all times. Some irregularities may not show up until the felt is finished, causing the felt to be rejected on its final inspection. In such cases we always assume the felt will make better blankets than paper. The operator must be constantly on the alert for irregularities which might result in slack edges, cockles, variations in width, etc. This is true whether we weave them endless or otherwise.

The felts when woven go to the splicing and burring departments. The splicing of felts is a most exacting process and can only be done by skilled workers. The fabric is then carefully inspected so that every misweave, broken thread, or other irregularities may be corrected before fulling.

The fulling or felting of felts is far more exacting than one might think. When you know that felts are woven double the finished width or better, you will appreciate something of the exactness with which this work must be done. Notwithstanding this enormous shrinkage, of approximately fifty per cent, the felt manufacturer is required to finish down to ordered width, being allowed a three inch variation over this size. If the felt is under the size specified, it will not fit the machine for which it was intended and if more than three inches over width, it is necessary to refinish, getting the felt down to the proper width. Therefore, when we are requested to finish a felt one inch wider or narrower, you may know that you are not giving the felt maker the easiest kind of a problem.

In fulling, the felts must be wet up a certain amount and run at regular speed under as near a certain estimated temperature as possible in order to get best results. After being properly washed to remove the oil and dirt, thoroughly rinsed to remove all trace of soap, and extracted, the felt is ready for the finishing process.

The finishing consists of stretching and drying the felts on a steam heated cylinder under a required tension so as to properly finish to the exact width and length. It is here that any imperfections show up, as the felts are given a most thorough inspection during this process. If the felts are to be singed or napped, this is done and they are then carefully wrapped and sent to the stock room.

Each felt is covered by a complete record, showing not only the exact lots of wool used but also all operators working on the felt as well as time required and condition of felt in each stage of processing. This record is indispensable in case any changes are desired at any future time.

Care of Felts at the Mill

At the request of your Mr. McBain, let us take up a few points on the care of felts after delivery to the mill.

Felts as you know, should be kept in a clean, dry place. Clean because the moths and even rats attack soiled felts quicker than clean ones, and dry to prevent mildew. Even although securely wrapped, mildew will destroy the felt if placed against a stone or brick wall for a period of time. An experiment proved to us that felts securely wrapped and kept in a clean, dry, well lighted room, collected no moths over a period of many months even though they had no naphthaline flakes in them. The flakes, however, if changed from time to time, are a good preventive. In some store rooms, felt bundles are slipped into canvas bags and tied, affording double security against moths.

Even in the felt mill, great care must be used to see that the felts are not torn by catching on rough objects in being taken to and from the stock room.

Grease from journals and bearings cause spots which may give trouble later by crushing at this spot as the stock will collect here, causing the felt to fill up.

The cause of felt troubles may be classified under two heads: 1—Chemical. 2—Mechanical.

Under the first, we find deterioration most rapid at high temperatures. This is especially true when washing felts. Should the change of temperature be too great shrinkage results or, if too strong a chemical or soap be used, the felt will be injured.

It has been proven that a felt run straight through will produce a greater tonnage than one run at irregular intervals, as the slow drying out and standing of the felt on the machine shortens the life to a greater or lesser degree, especially should there be any press rolls which have not been lifted from the felt. It is for this reason, therefore, that the felt maker as well as the paper mill superintendent

(*Continued on page 23*)

Lake States Forest Station

How the New Station Aims to Help Solve Reforestation Problems for the Middle West—Taxation of Land Another Question for Solution

By Raphael Zon*
Director Lake States Forest Experiment Station

I HAVE no set paper, and I am somewhat sorry that my friend Porter drafted me to speak to you about the Lake States Experiment Station so early in the game.

The station came into existence last July, legally, that is the fiscal year, but it started really about September 1st, so you can see that it is nothing but just a baby. It is just learning to walk. I would have liked to come to you a little later to speak about the experiment station. So many enterprises start out with a great sounding of trumpets and they then peter out and you never hear of them again.

I would have preferred to talk to you about what we had done rather than what we are going to do, yet I cannot help it, and as long as I am here, I think I will tell you something about hopes, aspirations, and probably the difficulties which we are going to face, and probably have to come to you to help us out of in many ways.

How It Came Into Being

As a matter of fact, the people here in the lake states have the right to know about the experimental station, for they were instrumental in bringing it about. We in Washington knew what it would mean to the timber interests, but at the present time there is a wave of economy, and the director of the budget is a despotic gentlemen and does not want to add a cent to the appropriation. The Secretary of Agriculture is sympathetic, and thought it was not the right time to ask for an increase in the appropriation, and so it was not recommended to him, but the people in the lake states were so persistent they have bombarded the Senate and Congress and an additional appropriation has been passed on the floor of the house, so it is your station, and you have a right to know about it.

You know what agricultural experiment stations are and what they have done for agricultural practice. Forestry experiment stations have to do for forest practice what agricultural experiment stations have done for agriculture. After all, forest crops and agricultural crops both are products of the soil. The only difference is that the agricultural crops can grow, most of them, in one year, but forest crops, even if you take the measley jack-pine and poplar, take at least thirty-five or forty years.

We have come to look upon forests as a crop; we are just about reaching the stage where forests as a mine have passed. We have been mining now for quite a number of years, and you know the results. I personally believe forestry is coming and coming soon, especially now in the lake states. It may not come as the result of a shortage of timber, but it must come as a physical proposition simply as a problem of agriculture. After all, if you analyze, wealth is produced by the soil. You can add labor, ingenuity to the raw products and add value to it, but the raw materials are produced by the soil.

There was a time when the people of the United States thought that the ultimate use, the final use, of all the land, was agriculture, that the real development began only when you cleared the land and put it under agriculture. We have done that for quite a number of years and what has been the result? We have in the lake states probably fifty or sixty million acres of idle land, producing nothing in the market for settlement. There are probably one hundred and fifty million acres of such cut-over land in the southern states, producing nothing on the market for settlement. Some of that land is pretty good agricultural land. The fact is there are no settlers to take up the claims.

The Secretary of Agriculture wanted to find out how much land would be needed for different purposes in about thirty years from now when the population of the United States will be about one hundred and fifty million people. That will be in 1953. A representative from the Forestry Service, and other bureaus trying to size up the situation figured it out, and all that we could figure up was that in 1953, when the population of the United States will be about one hundred and fifty million people the country will need only thirty-five million acres additional land. That is all that will be needed. You know what you have in the lake states alone more than that now in the market for settlement, to say nothing about the southern states, etc.

It stands to reason those lands will not be absorbed in agriculture. At the rate at which Northern Minnesota is now being cleared and settled, it will take a century to absorb only the best part of the land, and you know that thousands of acres are added every year to that vast area of cut-over land, and so the lake states have now accumulated a large domain of idle waste land producing nothing.

Waste Land Fatal to Nation

There is no state, no nation, that can really last very long which has enormous areas of waste land. It is not taxable property, no wealth is produced, and what is happening is that the burden of taxation is gradually shifting to the cities, because that country does not produce anything worth while.

I was much interested in the controversy going on in Michigan not long ago between Wayne county, which is Detroit, and the rest of Michigan. Wayne county saw they needed a greater representation in the legislature. The rest of the country thought they did not need it and Wayne county, Detroit, refused to pay taxes, and Michigan was up against it. Detroit forced a special meeting of the legislature to reconsider and get a fair representation. That country does not produce any wealth that is not taxable property, the cities assume greater burden of taxation, and the cities begin to dominate the country. It is the old story that he who pays the fiddler can order the dance.

So, as I say, for simple physical reasons, each state will have to do something with that idle land. Now, I do not want to say what a senate committee may or may not do, but I have a hunch that after the hearings of the senate committee which were held throughout the country, there may come a recommendation for a federal appropriation, probably a considerable federal appropriation, for reforestation.

The government may come to the state of Michigan, for instance, and say, "Here is a hundred thousand dollars. Are you going to duplicate it?" and let us use that money for reforestation purposes. There will be probably a big reforestation program in the lake states, and that is one of the tasks of the forest experiment station, to prepare the ground for it.

---

* *Address before Woodlands section at Fall Business Conference, Chicago, October 8 to 11, 1923.*

Now, with an appropriation, we cannot plant more than say twenty-five or thirty thousand acres in the lake states. That will make only a small impression on an area of several million acres that have to be planted.

We have to decide what the plan will be. Second, to make it as a business proposition, we want to know what kind of land to plant to certain species, and what you can expect from that land in trees of growth of wood per acre per year. One of the first things we are doing now is to make a study of what we call the yield of such species as jack-pine, poplar, birch and some other species in the lake states. We ought to be able to say that on such-and-such land the jack-pine will produce so much a year, it will cost so much to put it on the land. You can figure out whether it is justifiable or not. The first thing we are planning to do is to make yield studies of several of the species in the lake states.

Another problem confronting us is the question of slashes. In the past the question of slashing has been approached entirely from a legal, legislative standpoint. In Minnesota they have passed a state-wide brush disposal law which was interpreted as pertaining to slashing. That law has not worked out very well. Often the way you carry out a law determines whether it is a failure or a success, and it happened to be a failure.

In order to burn brush, we know perfectly well, in our national forests, you have to be right on the spot at the right time and have a large supervisory force to see that it is done properly. If you don't have those provisions it is better not to burn the brush. What happened in Minnesota was this: there was a mandatory provision that all brush should be disposed of and chiefly by fire. After slashings, a foreman, sometimes early in the spring, would stick a match into the slashing and it would not burn. It would be a little too wet. He would let it go. It would get dry. Then he would stick another match in and it would be too dry. It killed the second growth and caused serious fires because the state authorities didn't have the force to supervise proper burning of the slashes.

We want to approach the question of slashes not so much from the legislative standpoint, not as a measure to enforce because it is required by law, but from the standpoint of utilization.

We are approaching the point where our chemical plants, the pulp plants can utilize the slashes, and we want to incorporate that in the forest production.

Problem of Taxing Forest Land

Now, there is another problem in which we are interested. I don't know whether you know it or not, but the state of Michigan has practically passed a law of forest land taxation. It passed both the lower and the upper house, and I understand that in Minnesota there is now a provision also, a change, in forest taxation which has passed the upper and lower house and is ready now for the people. I think in a few years both of those taxation laws, making it possible for the owners to hold cut-over land for second crops will become an established fact.

With Michigan on one side and Minnesota on the other, how long will Wisconsin hold out? I believe that a revision in the tax laws with regard to our forest land will be an accomplished fact within the next few years.

Michigan last year appropriated something like two hundred and twenty-five thousand dollars for fire protection. The timber man will be really confronted with the plausible and perfectly economical problem of what to do with his land so as to provide for future crops. It does not concern so much you pulp men, but here in the Northern penninsula of Michigan they have some of the hard wood forests, the birch, beech, maple, the basis of all the furniture industry of the lake states. Those hardwoods, maple, birch, beech, are probably two or three hundred years old. If cut clean, those people will never be able to grow again the same size of trees.

That means certain kinds of timber will go out of existence entirely, and then you may all feel that cutting certain trees below a certain diameter is a losing proposition, but they are afraid of the tax assessor, for fear if they leave some timber on the ground the tax assessor will tax it as virgin timber, and there you are. Therefore, they prefer to cut it clean, slash it and burn it than let it lay idle, revert to the state for taxes, or some other way.

It becomes very interesting as to whether clear cutting of those hardwoods is really the best thing. I personally believe that by cutting only partially, leaving for instance, ten or twenty per cent, it will prove to be a much better paying proposition, for in this way they can maintain that old growth which is so valuable and the prices for which will go up probably in the next few years.

It will be possible to maintain a supply of that old timber, and so the question of how to cut the timber into hardwoods will be a problem we must try to solve.

The people in the upper peninsula of Michigan were so much interested that they are locating now a tract of timber for use, about three thousand acres in extent, and are willing for us to take a portion and cut it over according to out plans. Some of it will be cut over clean and some will be cut so as to leave twenty or ten per cent of it standing.

I personally believe that the lake states are better off than the northeastern states from the standpoint of pulp. Here in the lake states there are two species which will be the redemption of the lake states, jack-pine and poplar. I wonder if you know that somewhere about thirty or forty miles from Duluth there is a company, a pulp company, that has a jack-pine forest of thirty thousand acres, and is buying young growth just about two or three feet in height. They have a forester, and they are spending thirteen cents per acre for fire protection, more than the government is spending for the finst fir on the coast.

The jack-pine and poplar provide ample raw material right here in the lake states.

I myself am very skeptical as to the private timber owners cutting this year and then planting and waiting for any returns. As an economic proposition it is too long. It is almost too expensive a thing for the state to do, but here is the poplar and the jack-pine, two species. Let them be grown for about thirty to forty years. They can be drawn on at the rate of about a cord per acre per year. That is something feasible, something that the timber owners can afford to do, especially if they have a large timber tract to begin with.

Here is a tremendous source of raw material for the pulp. And I wonder if Dr. Rue is here. I think he can tell you a lot about this. I think the pulp proposition will revolutionize the forest problems in this country.

I sometimes dream that in about fifteen or twenty years from now the old method of taking a log and ripping it up into sawboards will be considered a very crude method. Every bit of wood will go into the grinder or digester and come out as a fiber and then be made into any product you want—a board as light as the cork, or as heavy as stick, or it may be made into any other pulp, paper or artificial silk that you desire. I am somewhat rambling, but I often think that really the age of woods is not behind us but ahead of us. We are all too prone to think that wood is something relative to a more primitive civilization. Now is the age of concrete, steel, electricity; I think we are just entering the age of wood, the age of cellulose. I was interested to see how the chemists are just discovering what a wonderful, unexplored field the chemistry of cellulose is, and not long ago the papers were full of information about a professor from Columbia, I believe it was, who was at a meeting of chemists and said he had discovered or developed a very practical method of converting the sulphite liquor of the the pulp mills into alcohol and using the residue for some fuel which would run the pulp plants. The possibilities of cellulose are tremendous.

Possibly with the exhaustion of gasoline and coal we do not need to worry as long as we have cellulose. We have our wood which we could use for the future.

Here we have tremendous areas of idle, cut-over land that cannot be absorbed in agriculture for several generations, and here the chemistry of the pulp comes in which can utilize the fiber for many different purposes, and it seems to me that the outlook for forestry and growing wood is very healthful.

I have been interested in analyzing and looking over the timber situation in the world as a whole. There are something like fifty-six billion cubic feet of wood used in the world; more than half of it is used by the United States. The consumption of wood within the last fifty years has doubled. It is increasing. Now, with the United States using more than half of all the wood in the world, there can be no chance for us, if we run out of wood, to get any from outside. We must grow the wood right here, we have the land to grow it on, it is economically possible to do it. I personally believe that the prospects for growing wood profitably, especially the faster growing species, is a perfectly economical and possible thing for the private owner.

May I end with this request? The Lake States Experiment Station is very new; we are merely getting our bearings; we are trying to formulate our problems. I could sit down and probably make out a long list of problems which ought to be investigated, but I am afraid they would be a little too academic. We want to devote our energies to problems worth while that are urgent, the things the industry needs, and I would like very much, Mr. Chairman, if the Woodlands section would appoint a committee that would help us to formulate those practical problems upon which we could work, and upon which they would like the Lake States Experiment Station to work, and we would meet with the committee and go a long ways with our funds, which are limited, to meet those requirements and help out our people and other wood using industries in the solution of their problems.

Paper Exchange to Have Market Service

By **John R. Mauff**
Executive Vice President

IN keeping with the modus operandi of all regularly established and leading exchanges and Boards of Trade, the paper Industries Exchange of Chicago and New York will, on November 1, take over and conduct its own market service department and statistical bureau. It will be maintained for the exclusive benefit of its membership, but considerable of the information will be made available for public use through the daily press and trade magazines, because it is the intention of this exchange to broadcast whatever it may possess bearing on the industry itself and the future welfare of those engaged therein that can in any way be a source of enlightenment to the trade and the public it serves. Suggestion and recommendations will always be accepted in good faith and acted upon whenever practical and helpful in the direction of improving the service.

An exchange is the eye of all true business.

It sees in its operation, stabilization, through legal price determination, with equalization of territory and fair opportunity to all.

It replaces the blindness of the old system, of trading in the dark, which created demoralization of thought and consequent speculation as to final results.

Other Associations Asked to Join

It is cooperation—the opportunity for a public service, without trespassing upon the restraint of trade law. We have seen a wonderful demonstration of this coöperative spirit in the conduct of the business of one of the prominent members of this exchange acting as host recently for the Folding Box Manufacturers' National association at Kalamazoo, Michigan.

It visualized and exemplified perfect cooperation in association and community work, and in the getting together on common ground of both capital and labor, in social work and service. Why should not this same spirit and opportunity prevail in the conduct of the business itself as between the various members of the industry?

In order to correct some erroneous ideas that have been set afloat by the uninformed, we may be permitted to say that this exchange does not come in conflict nor dispense with the established trade associations. The largest grain exchange in the world, in Chicago, has been in operation many years; nevertheless in its membership we find the millers' association, the feed dealers' association, the feed manufacturers' association and many others.

It is unfortunate perhaps that such associations may not legally avail themselves in any way of what is commonly known as "price information." This can only be accomplished through an association where buyers and sellers have equal opportunity of representation and where such price information may be obtained only through the exchange system of trading by public outcry, thereby establishing prices that correctly represent market values.

With this thought in mind it is our suggestion that the members of the various associations join this exchange, and bring in their entire association work and their secretaries, combining this valuable work with what the exchange exclusively has to offer.

In conjunction with this there is also the suggestion of incorporating a research department. No one will say there will not be developed various other uses to which paper products may be put and there will be more practicability in this suggestion in conjunction with the paper industry than in various other research departments of other industries where an endeavor of this kind comes face to face with antagonism and uneconomic principles which are difficult to overcome. In the wake of the use of paper products there is always economy and efficiency and entire practicability. Therefore, a research department would develop progress along proper lines unhampered by any thought of probable natural difficulties to be overcome, following discovery of new ideas for the economic utilization of such paper board products.

There has also been false propaganda to the effect that this exchange will dispose of the necessity for salesmen in the industry. There can be no doubt about an exchange such as this changing most decidedly the principles of salesmanship as at present understood and conducted, because price determination on an exchange does away with the necessity on the part of the salesman to either engage in the cutting of prices or the guessing of values.

(Continued on page 21)

Michigan Superintendents Meet

The Michigan Division of the American Pulp and Paper Mill Superintendents held their regular meeting on Wednesday evening October the 24th at the Park-American hotel, Kalamazoo Mich.

F. A. Smith of the Sorg Paper Co. of Middletown, Ohio, spoke on "What I Saw in the Paper Mills of Europe." He stated that the tendency was to have small beaters and lots of them in Europe. The average beater was 300 pounds. Very few mills had Jordans, this work being done by beaters. Their equipment was old, and had practically no speed, but they made their money by watching small things. Labor is very cheap, so they can employ men to pick over stock which in this country, would run the cost up to an enormous figure.

Those present were: C. G. McClellan, Kalamazoo Veg. Parchment Co.; A. G. Wightman, Hawthorne Paper Co.; S. W. Simpson, Otsego, Michigan; C. O. Thorne and LaVern Hotelling, Watervliet Paper Co.; Elmer East, Arthur Camp, Michigan Paper Co.; O. E. Kiaer, Buck Kiarer & Co.; J. A. Aull, Sorg Paper Co.; Jacob Kuss, Frank Johnson, George Pountain, Albert Lidner, Allied Mills; Theo. W. Dunn, Detroit, Mich.; W. A. Yule, F. C. Huyck Sons Co.; Alfred Bryant, E. H. Gilman, Felix Pagenstecher, O. F. Fisher, Bryant Paper Co.; A. W. MacVie, Kalamazoo, Michigan; F. W. Vickery, London, England; Jacob Parent, Western Board & Paper Co.; Michael Redmond, Kalamazoo Paper Co.; C. L. Harter, Rex Paper Co.

Supply Firm Expands

The business of A. De Angelis, Inc., of Brooklyn, consolidated with the Marquardt-Hewitt Corporation of 250 Front Street, New York. Ben De Angelis and Andrew De Angelis, heretofore of the former concern, will join the latter organization and all business of the De Angelis firm will be conducted from the offices and warehouse of the Marquardt-Hewitt Corporation.

A. De Angelis, Inc., is one of the oldest paper mills supplies concerns in the New York trade. Founded more than 35 years ago, it has been at the forefront in the paper stock trade, and has operated one of the largest warehouses in this line in Brooklyn.

The Marquardt-Hewitt Corporation was organized about a year ago, and has made rapid strides since it started in business. It operates a large warehouse at 250 Front street, running through to Water street, and with the addition of the Messrs. De Angelis and their experience and business clientele to its organization, the company's facilities and staff have been increased to enable it to greatly expand its operations.

Nine Months' Paper Exports

While paper exports from the United States during 1923 have not consistently increased from month to month, says the paper division of the Department of Commerce, it is interesting to note that on comparing the total value of the exports for the first nine months of 1923 with a similar period during 1922, this years' shipments are approximately $1,500,000 in excess of those for last year. Increased shipments of paper board and strawboard account for about one-third of the gain made during 1923, shipments of these products having increased $514,921 in value over 1922.

Exports of playing cards, which rose from $413,174 in 1922 to $903,143 in 1923, and of book paper, which rose from $2,065,249 to $2,380,811, also show notable gains although in the case of the latter item the increase was due to better prices rather than to a larger volume of shipments.

Exports of wrapping papers also exceed slightly in value those of 1922, but as in the case of book paper, this is a result of better prices, the amounts shipped having actually fallen off.

Exports of newsprint and writing papers have declined both in quantity and value during 1923.

Among the lesser items on the paper schedule, the following gains have been made during 1923 as compared with 1922: greaseproof paper, $61,290; surface-coated paper, $57,645; toilet paper, $47,366; towels and napkins, $38,327; wall board, $129,103; hangings, $126,229; carbon paper, $101,495; envelopes; $36,277; papeteries, $35,096.

Exports of photographic paper have declined $21,115 in value as compared with last years' shipments, although the amount shipped is somewhat larger.

Aside from the items mentioned above paper bags are about the only product to show any great decrease during 1923 as compared with 1922, shipments of this article having fallen off $145,238. Exports of cover paper, bristols and bristol boards, sheathing and building papers, and cigarette paper and books were also less in 1923 than in 1922.

Belgo Construction Achieves Record

Belgo-Canadian Paper company's new groundwood unit is in operation in Quebec province, something like a record having been achieved in the speed of its construction.

The contract was not let until the middle of August, and now forty tons of groundwood pulp daily is being ground by the new machine.

The pulp is now being marketed as surplus, but will be all used when the second of the new newsprint machines gets into operation about the end of November.

One of the two new machines is running and is turning out about 96 tons of paper daily. As the machine was rated at only 75 tons a day the extra production is a factor of real importance from the standpoint of profits.

The company has also completed a spur track to bring in logs by rail. The logs are dumped into the river at the plant and carried through the mill in the same manner as the logs floated down the St. Maurice.

Hubert Biermans, vice-president and general manager of Belgo, arrived from a trip to the continent last week. He went over on personal business but while in Belgium cleaned up the final details of the transfer of the company to Canadian control.

Paper Mills For Pacific Coast

Colorado interests have sent engineers into the Shrimp bay regions, near Ketchikan for the purpose of selecting a water power site for a paper mill, while California capital has sent engineers to the Thomas bay district near Petersburg, Alaska.

In addition to this, the California people have an option on a site within the city of Seattle for the erection of a paper mill, and if the plans mature, it is said that they are ready to expend $10,000,000 for a modern mill.

Other capitalists are looking into the feasibility of erecting a paper mill on the south fork of the Stillagumish river, Snohominish county, Washington.

It is expected that out of the four ventures, one or more will be carried to a finish.

The engineers who have gone to Alaska expect to have their report ready sometime during November.

The American Tissue Mills at South Hadley, Mass., will soon take over the plant of the B. F. Perkins & Son, Inc., located at Holyoke, Mass., as a step towards the plans for expansion by the former concern. The American Tissue Mills have also awarded a contract for another plant to be built in Willimansett, Mass., work on which has already been started.

Harold B. Wadsworth

What promised to be a joyous family reunion at the home of Harold B. Wadsworth, the well known paper maker and engineer, in conclusion of an extensive trip abroad, proved a very sad affair.

Mr. Wadsworth sailed from Tokio, Japan, on the S. S. Empress of Russia and reached New York Monday, October 22, apparently in the best of health. In a few days he developed a severe attack of some puzzling ailment and was rushed to the Willard Parker hospital of this city where he passed away on Saturday, November 3. Mr. Wadsworth's sickness is attributed to the poor food and water conditions in Tokio, due to the recent disaster in that country. In making his connections on his trip home he was obliged to stay over for three weeks at Tokio to await the sailing of the steamship to the United States.

Harold B. Wadsworth

Mr. Wadsworth left the United States for Japan on July 21 last to supervise changes in different paper mills in Japan. He was credited with installing the first high speed news mill at the Tomakomai mill on the island of Hokkaido. At the time of the earthquake in Japan he was superintending the work at his plant. His further mission in Japan was to book future orders for machinery and look after interests which had been established there for over seven years.

Born at Harrisville, N. Y., Mr. Wadsworth began his career as a paper maker at three dollars a week at the age of 13 in the C. R. mill of the International Paper company at Glen Park, N. Y. By strict attention to business he worked his way to prominence. At the age of 26 he was connected with the St. Regis Paper company at its Deferit mill.

About this time he was sent to France by the Bagley & Sewall Co., of Watertown. He remained in France for one and one-half years and in 1909 Bagley & Sewall Co., sent him to a new mill in England where he remained until 1911, when he went to Japan. Mr. Wadsworth was at one time superintendent for the Warren Parchment Co. mill at Dexter, N. Y.

In the many years spent in the paper industry in the United States, Canada and abroad, Mr. Wadsworth gained a host of friends and acquaintances who will mourn his loss. He was greatly honored in the trade for the efficient manner in which he conducted his business.

Mr. Wadsworth is survived by his wife, Jessie B. Wadsworth, a son, Leo. J. Wadsworth, and daughter, Elizabeth Joan Wadsworth. It has been announced from his New York headquarters that his business will be carried on as usual by his wife, who is well acquainted with his business methods and is well able to look after his interests. The paper mill supply end of his business will be carried on under the supervision of a brother, Charles A. Wadsworth, who has been handling this department for several years. There will be no change in the business policy of the firm, it being the aim of the successors to carry on the business in the same efficient manner.

Oppose Canadian Embargo

Numerous Maine pulp and paper manufacturers appeared before the Royal commission at St. John, N. B., recently to protest the placing of a proposed embargo on pulpwood with a view to forest preservation, and vigorously opposed an embargo. These manufacturers hold concessions in the province.

Gray B. N. Keith of the Atlantic Pulpwood company opposed, declaring it would mean the loss of substantial revenue to farmers owning timberlands and that it would prevent American capital from operating in New Brunswick. He declared it was not the pulpwood crews, but careless fishermen and lumbermen who were logging that caused the forest fires.

Edgar Rickard, president of the Pejepscot Paper Co. said that his company, which manufactured sulphite pulp and paper, obtained its chief supply from Canada, owning 600,000 cords in New Brunswick and 300,000 more cords elsewhere in Canada. An embargo would cut off 30,000 cords from Canada annually. The tracts were located where it was impossible to develop water power to operate a plant. The wood is shipped to Bath, Me. and the cost is from $4 to $5 per cord for shipping.

Development of Oregon Mill

The saw mill unit of the Columbia River Paper Mills corporation's plant at Lebanon, Ore., has begun sawing lumber and is now employing a crew of 100 men.

The mill is modern in all respects; the machinery, which will cut 125,000 feet in eight hours, is driven by electricity.

The management will not use the best wood materials brought to the mill for the manufacture of woodpulp, but a good grade of lumber will be manufactured. Also later a box factory will be added to the plant and boxes manufactured. On account of the large fruit industry of the Pacific coast the demand for boxes the last few years has far exceeded the supply. Only the poorer grade of logs will be ground into pulp.

Work on the main paper building foundations is being rushed so that there will be no delay when the structural steel begins to come in from the East. The plant when completed will furnish employment for not less than 600 men.

George Kerr, Downington, Pa., an official of the Kerr Paper Mills Co., of that place, died, Oct. 18, as a result of injuries sustained when he was attacked by a bull at his farm two days previous. Mr. Kerr was a breeder of fancy Holstein cattle, and was just opening a stall for the animal when it turned on him. Several ribs were broken and one lung punctured.

The Smith-Goesling Paper Box Mfg. Co., has been incorporated in St. Louis, Mo., by August Goesling, 22 Benton Place, R. F. Smith, 5177 Vernon Avenue, and others.

Construction News

Deferiet, N. Y.—The St. Regis Paper Co., Watertown, N. Y., has preliminary plans in preparation for the construction of a new plant at Deferiet. It will consist of five individual mill units, with power house and auxiliary buildings, and is estimated to cost approximately $500,000, with equipment. It is expected to ask for bids in the near future.

Elsas, Ont.—The Continental Wood Products Co., has tentative plans under advisement for the construction of a new pulp mill in this vicinity. The reported cost is placed in excess of $150,000.

Grand Rapids, Mich.—The Grand Rapids Calendar Co., has filed plans for the erection of a two-story addition to its plant, 80x116 ft., estimated to cost about $22,000.

Kalamazoo, Mich.—The Valley Paper Co., Press building, is planning for the installation of equipment at its plant, including paper machine, beaters, and kindred apparatus. Tools will also be purchased for a machine shop at the at the plant.

Chicago, Ill.—The South Side Paper Stock Co., 5838 Throop street, has tentative plans in progress for the rebuilding of its two-story and basement works, 50x100 ft., recently partially destroyed by fire. The reconstruction is estimated to cost $22,000. A. Epstein, 2001 West Pershing road, is architect. Robert Colbus is president.

Seattle, Wash.—The Industrial committee of the Seattle Chamber of Commerce is in contact with a paper manufacturing company in California, whose name is temporarily withheld, relative to the construction of a large paper mill on site near the city. The project is expected to mature at an early date.

Biron, Wis.—The Consolidated Water Power & Paper Co., Wisconsin Rapids, Wis., has preliminary plans in preparation for the construction of a new machine shop at its works at Biron, estimated to cost close to $45,000, including equipment.

High Falls, N. Y.—The International Paper Co., 100 East Forty-second street, New York, is perfecting plans for the construction of a new hydro-electric generating plant on the Saranac river, near High Falls, reported to cost close to $45,000. The plant will be used for power service at the company mills in this section, as well as for commercial light and power supply. A dam 100 feet, high will be constructed for the water head.

Quebec, Que.—The Saint Regis Pulp & Paper Co., has acquired property at Cap Rouge, near Quebec,, heretofore held by the Canadian National railways, and plans to use the site for the erection of a new pulp and paper mill. The proposed plant will consist of a number of units, estimated to cost to $3,500,000 including equipment.

Plattsburg, N. Y.—The Saranac Pulp & Paper Co., has taken over the former local plant of the Lozier Automobile Co., and will remodel and improve the structure for a new mill. It is expected to install machinery and operating equipment at an early date. H. P. G. Nostrand, formerly connected with the Stevens & Thompson Paper Co., Greenwich, N. Y., is general manager of the new company.

Piqua, Ohio—The Orr Felt & Blanket Co., has tentative plans for the rebuilding of the portion of its works recently destroyed by fire with loss reported at $200,000, including equipment and building, the latter being leased from the Pioneer Pole & Shaft Co.

New Companies

Brooklyn, N. Y.—The Protex Products Co., has been incorporated with a capital of $25,000, to manufacture and deal in paper products. The incorporators are A. Stone, M. Frost and S. Friedman. The company is represented by Konnoson & Konnoson, 170 Broadway, New York.

New York, N. Y.—The Schimek-Walsh Paper Co., has been incorporated with a capital of $50,000, to manufacture and deal in paper products. The incorporators are F. M. Walsh, and I. R. Elman. The company is represented by P. G. Burroughs, 30 Church street, New York.

Norristown, Pa.—The Burnett-Reese Paper Co. has been incorporated with a capital of $30,000, to manufacture and deal in paper goods. J. Harding Reese, Norristown, is treasurer.

Financial

Springfield, Ill.—The Springfield Paper Co., has filed notice of dissolution under state laws.

Brooklyn, N. Y.—The Active Paper Co., 1141 De Kalb avenue, has filed notice of increase in capital from $14,000 to $21,000.

Buffalo, N. Y.—The Arrow Paper Box Co., has filed notice of change of name to the Paprus Products Co.

Nipigon Mill to Be Operated

The Nipigon Pulp and Fibre Mill at Nipigon, Ont., will re-open with a twenty-four hour shift on Dec. 1, it was announced last week by officials of the company which is to operate it.

The mill will produce ground wood only, and will employ upwards of fifty men throughout the winter.

Engineers have been on the job for the last two weeks making a complete overhauling of the machinery and buildings.

So far as known the mill will be operated under the name of the Nipigon pulp and fibre mills, until a new company, if any, is formed. It was stated by one of the officials of the St. Lawrence Pulp and Paper company that the mill was not being taken over by that organization but rather by a combination of interests associated with the St. Lawrence company and the Guaranty Investment Corporation of Montreal.

New York Trade Notes

Ralph Bretzner, formerly with the Perkins-Goodwin company in the wood pulp department, and more recently with J. F. Patton & Company, of New York, of which company he was secretary and sales manager, is now sales manager of the Becker Woodpulp Company of America, Inc., importers and dealers in wood pulp of 501 Fifth avenue, New York. Mr. Bretzner succeeds Frank E. Dunaway, who recently resigned from the Becker organization.

Ira S. Reynolds, formerly sales manager of the Claremont Paper company and the Groveton Paper company, has joined the organization of Mead, Patton & Company, Inc., of 342 Madison avenue, New York, as sales manager for the Deerfield Valley Paper company's output of kraft paper. This mill has been in operation since the first of this year and is bringing a second machine into production in the near future.

Josephson & Jacobson, Inc., is the name of a new concern just organized and incorporated under New York State laws, with office and warehouse at 19 Howard street, New York, to pack and deal in all grades of cotton cuttings used by paper manufacturers. The corporation's capital is $10,000, and J. Jacobson is president and S. Josephson is secretary and treasurer.

The Lion Boxboard company, jobbers in paper box boards, has moved from 507 Broome street to 455 West Broadway, New York, where it is carrying a complete stock of boards, featuring news and chip grades. The new quarters of the company are appreciably larger than the former location.

Support the Good Work

THE duty of carrying on an energetic campaign to rouse the people of the United States to a realization of the necessity for a definite and aggressive forest policy seems to devolve largely upon the paper industry.

There is a popular superstition that paper manufacturers are largely responsible for the denuding of our forests, especially in the East. A sufficient answer to this charge is the bald fact that the paper industry consumes less than 4 per cent of the total amount of wood cut each year.

In spite of its position near the bottom of the list of wood consumers the paper industry is at the top of the list of organizations carrying out a definite program of forest preservation and restoration.

Not only is it carrying on a program of its own but it is active in arousing the entire country.

Naturally, this work centers in the largest organization of papermakers, the American Paper and Pulp association. It is fortunate indeed that the executive secretary of this association is himself a trained forester.

By appearing before the committee appointed by the U. S. Senate to investigate the forestry question and by talks on forestry before numerous organizations in different parts of the country, Dr. Hugh P. Baker is spreading greatly needed knowledge of the seriousness of the situation and the means that must be adopted to remedy the difficulty before it is too late.

In a bulletin recently issued by the association Dr. Baker reviews the situation from the standpoint of the whole nation, citing not only the great increase in the cost of lumber, pulpwood and cordwood but the inevitable danger that the supply will soon reach the vanishing point.

He summarizes under four heads the steps that must be taken in order that definite results may be attained.

He says, "The first and most important step to be taken in protecting, preserving and increasing our forests is to stop forest fires. Several of our States have made fine progress in applying methods of protection of the forest from fire.

"The second step is to change present wrong methods of taxing forests and forest lands. Our forests have been wrongly taxed down through the years, with the results that more forests have been wasted in this country through bad methods of taxation than have been used by the entire furniture industry, for example.

"Instead of taxing the forest crop annually, forest lands should be taxed on the basis of yield; that is, there should be a low general tax on the land as there is on agricultural land, and then when the forest is cut, there should be a tax on the yield of wood.

"A third step necessary in bringing back our forests and making them productive is to begin reforestation upon lands which have been so denuded that they will not come back to forests even if they are protected from fire.

"Finally the public should demand that Congress adopt a sensible national forestry policy. We haven't as yet the interest and support of a sufficiently large part of the public to secure action by the Congress."

In the language of the legal profession, "the issue is joined." In other words the summary of Dr. Baker shows clearly what must be done if the entire nation are to be protected in a sane and reasonable way.

Reforestation and preservation is no longer a question of sentiment—it is an imperative necessity. The happy-go-lucky attitude of the American nation must be changed and we must follow in the footsteps of the nations of Europe in conserving our forest resources.

There is much to be done. Not only must several states be induced to adopt needed legislation to make the restoration of our forests possible and practical, but Congress must be aroused and a national policy must be adopted that will encourage in every way the conservation of our most important national asset.

It is the duty of public spirited men, whether in the business of making paper or in any other business, to do everything in their power to support the action of the American Paper and Pulp association in arousing public sentiment until definite action is secured on this important question.

Forestry in the Paper Industry

Conducted by J. R. Simmons, Secretary Forester,
The New York State Forestry Association

Activity In Pulp Wood Market

Increased contracts for pulpwood from all sections of the country are the feature of the report of the Woodlands section of the American Paper and Pulp association on current pulpwood conditions.

On Sept. 1, Dec. 1, and Feb. 1 of each year this section tabulates the figures on pulpwood under contract in the chief paper-making sections of the country, and the 1923 figures show a larger number of mills reporting than ever before. An increase in the price is found in all grades of pulpwood and in all the districts reporting.

Stocks on hand in the New England and New York regions are smaller than a year ago, accounting possibly for the larger contracts placed. Eight New England mills, with stocks on hand of about 185,000 cords less than last year, have under contract 399,000 cords, as against 363,800 cords at the same time last year. The same is true of the New York mills, thirty-four of which report a total of 464,900 cords under contract as compared with 345,000 cords at the same time last year. These mills have stocks on hand of 505,700 cords as against 706,170 cords at the same time last year.

These figures are significant in view of the charges of Canadians that there has been a rush to import wood since the threat of an embargo was made. In each case the total of stocks on hand and under contract are less than at the same time last year. In the lake states, where the wood is closer to the mills and where stocks are not carried so long a time in advance, the percentage of wood in stock or under contract to the total consumption is smaller than in the northeast. Increased stocks and contracts in the lake states are accounted for by a larger consumption in 1923 than in 1922.

Prices for the wood are in every case higher than a year ago. In New England, for instance, the price of rough wood averaged $14.80 this year, as against $14.25 a year ago; and the most notable increase in cost is for the rossed wood bought by New York mills, for which the price is $23.70 this year as against $22.14 a year ago.

Wisconsin Protective Association

Officers of the new Wisconsin Forest Protective association are pushing ahead the detail of perfecting the organization, and it is probable that every paper and pulp manufacturer in the state will soon be enrolled in the membership. While those present at the recent organization meeting are interesting mills not represented at that time, Secretary B. T. McBain is at work on the formulation of a constitution and by-laws which may in a large measure be based upon the form already so successful in the regional fire-preventive associations of the Pacific Northwest.

In connection with the purpose of the new organization the following statement by one of the officers will be of interest:

"Most of the mills in the State of Wisconsin are represented in this association, and the plan is not only to protect what forests still remain but to aid in the planting and growing of new forests on the cut over lands. Wisconsin now has only about ten years timber ahead, and while it will take from thirty to fifty years to produce a new crop, if the present growing trees are protected from forest fire there is a possibility of making the present supply not only last longer but also close the gap where, at present outlook, there will be no timber available."

A most significant feature of this conference was that it was held with prominent state officials present, all of whom believed that the proposals for future activity were essential to the permanence of the industry in the state. The campaign for forest protection and for legislation to aid in perpetuation of the forests will be with the full sympathy and encouragement of the state officials in charge of the related administrative activities, so that Wisconsin, noted for its political progressivism may be one of the states to take an early stand for forestry laws which will keep the paper mills within the state indefinitely, instead of allowing them to be driven out by the decline of timber resources.

Another important phase of the new association's activities may be the organization of similar state associations of pulp users in other important paper-making states, to put the paper and pulp industry on record in each of these states in favor of definite forestry legislation and policies.

D. C. Everest, of the Marathon Paper Mills Company of Rothschild, president of the organization, is especially enthusiastic over the possibility that the Wisconsin movement will spread and achieve results in other states.

In addition to the officers elected as previously reported in PAPER, the following have been added as directors, forming, with President Everest, Vice-President Delbridge and Secretary McBain an Executive Committee: Guy Waldo, Flambeau Paper Co., Park Falls, Wis.; O. Bache Wiig, Wausau Sulphite Fibre Company, Mosinee, Wis.; F. E. Sensenbrenner, Kimberly-Clark Company, Neenah, Wis.; C. L. Cecil, Cornell Wood Products Company, Cornell, Wis.

Gipsy Moth Barrier Zone

There is probably not a timberland owner in the eastern section of the United States who has not at some time given serious consideration to the question whether state and national effort to wipe out the gipsy moth would eventually succeed. In view of the fact that the gipsy moth caterpillar when full grown can feed on pine as well as hardwood, owners of softwood have not considered themselves immune from danger. Yet if all our forests in the northeast were coniferous forests, the gipsy would quickly die out. In the infant stage he is dependent upon easily digested food.

The total area now infested by gipsy moth has reached the rather startling figure of 30,000 square miles. New England is fairly well covered with this obnoxious pest, and he is gradually making his way in from the seacoast in a westerly direction.

There has recently been established a "Hindenburg Line" or barrier zone from Long Island sound to the Canadian border along Lake Champlain, and along this line of defense the battle against the gipsy will be waged by every means at the command of the state and national governments.

H. L. McIntyre, state supervisor of gipsy moth control along the new defense line on land lying within the State of New York has established five temporary weather stations to determine how far and in what directions the recently hatched caterpillars may be carried on the gentler air currents. Other experimental work is going forward at a rapid pace.

A heavy infestation has recently been discovered on the eastern border of Lake Champlain and some anxiety is felt for the safety of the forests on the northern end of the defense line. It is to be expected that the gipsy will launch his attacks on the wings as well as along the center of the line. If he goes through New Jersey he will find plenty of food trees on which to live in the early stages of his development; and if he gets into the Adirondack forest, where an abundance of hardwood as well as softwood exists, he will be equally dangerous, and the fight will be severe.

Coolidge Interested In Forestry

President Coolidge has manifested his interest in the forestry problem by asking Senator Moses of New Hampshire to confer with him on this subject. They had a detailed talk on the forestry situation Oct. 20, and Senator Moses told the President of the interest manifested in the different states during the tour of the Senate committee of which Senator Moses is a member.

The President declared to visitors that he has reports indicating that more trees are destroyed each year by fire than by the axe, and he feels personally that the whole reforestation problem is a matter of the greatest importance.

Some of us will recall those crisp remarks which Mr. Coolidge used to make before the annual forestry conferences in Massachusetts when he served as lieutenant governor and later as governor in the Bay State. There is encouragement in the fact that the President comes from a state where considerable progress is being made along the lines of equitable forest taxation. Massachusetts is trying out a forest taxation law based on the yield at time of cutting.

New Booklet On National Forests

"National Forests of the Southern Appalachians" is the title of a new booklet just published by the U. S. Department of Agriculture, calling attention to the rapid development of forestry in West Virginia, Tennessee, North Carolina, and Georgia.

There are seven national forests in the Southern Appalachian region embracing about 1,500,000 acres. Most of this acreage is either now forested with both virgin and second-growth timber or is capable of growing new timber crops.

All of the Appalachian national forests have been built up under the provision of the Weeks law passed by Congress in 1911. The primary purpose of this law is to protect the headwaters of the great navigable streams east of the Mississippi river by maintaining forests on their watersheds. Acquisition of land suitable for national forest purposes has proceeded steadily under annual appropriations by Congress, though such appropriations have been seriously curtailed since the beginning of the World War.

Copies of the new booklet may be had free upon request to the District Forester, U. S. Forest Service, Washington, D. C.

Western Office For The A. P. P. A.

A movement has been started by middle western paper and pulp mills to have a western office established by the Woodlands section of the American Paper and Pulp association. The subject was discussed at the recent Chicago meeting of the section, when it was pointed out that the placing of the Woodlands section office in the west, with Secretary O. M. Porter in charge, would constitute the branch office of the American Paper and Pulp Association which so many of the western mills are desirous of having near at hand. Active interest in forestry on the part of the western mills was urged as a reason for adoption of such a policy.

Bagging The Forest Fire

The New York State Forestry association, Albany, N. Y., tried out a unique method for fire prevention this year by distributing 200,000 paper lunch bags, bearing on one side a fire notice printed in bold type. Distribution of the bags started in the spring of the year among campers and fishermen, who were requested to "carry your lunch in this bag the next time you go into the open to fish, camp, hike, or hunt." During the summer the distribution reached the hotels and lunch rooms in the mountains. The lumbering companies then took it up and supplied bags to the men in the woods, and when the hunting season opened this fall the campaign was extended to reach the sportsmen.

The association announces that it still has several thousand bags on hand and these can be had in packages of 500 for postage only, on the understanding that they will be distributed among men who work in the woods. These bags are five pound size, and were made up and printed by the Union Bag & Paper Co. The first two hundred-thousand were provided by the Utica Duxbak Corp., a corporation member of the forestry association.

While H. D. Cochran, assistant chief of public relations in the Denver office of the United States forest service, addressed the Colorado Agricultural College at Fort Collins, Mrs. Margaret Wallace Chipley of the Denver office was in Pueblo talking forestry to the school children.

Up to November 1, there were only 57 fires in the national forest of Colorado, as compared with 105 for the corresponding period of 1922. The acreage burned decreased from 271 to 62, the damage from $31,125 to $744. Human agency fires decreased from 73 to 25.

New Developments in Paper Making

Bleaching Cellulose

The process of bleaching cellulose which is patented in United States patent No. 1,470,566, and which is assigned to the Brown Company, is described as one in which the material is super-bleached by subjecting the bleached material to the action of chlorine to increase the whiteness without any substantial change in the strength or beating qualities of the material.

* * *

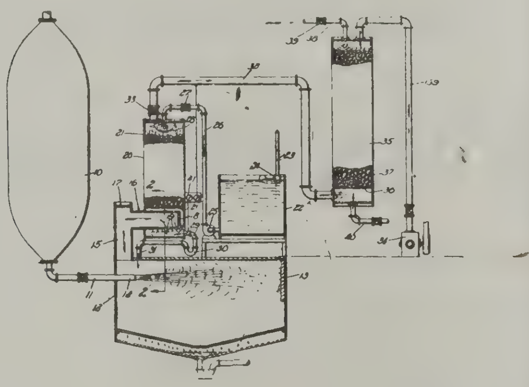
Treatment of Paper Pulp

The invention which is patented in British patent No. 202,575 refers to a method of treating wood pulp, waste papers and similar fibrous paper-making materials in which the material is subjected to a sawing action followed by a kneading action; also a method of treating wood pulp and the like in which the material, after a combined sawing and kneading treatment, is conveyed pneumatically to beaters and other machines. The apparatus which is used for sawing the wood consists of a number of oblique rotary saws engaging with stationary bars or teeth and disintegrating bars revolving in a housing carrying stationary bars which engage with the revolving bars.

* * *

Recovering Waste Sulphur Gases

United States patent No. 1,469,958 is concerned with an apparatus and process for recovering the waste sulphur gases (sulphur dioxide) from blow-pit vapors and gases. These are conducted through a mass of interstitial surface material in counter-current flow with cold water. The gases are cooled and the vapors are condensed by direct contact with the water. The free unabsorbed sulphur dioxide is recovered as well as that absorbed in the heated water.



* * *

Adhesives From Cellulose Waste

A review of the various processes whose purpose it is to convert sulphite cellulose waste liquors into adhesives is given in the British publication, Chemical Trade Journal.

In one process it is pointed out that the strongly acid liquors deposit adhesive solids on exposure to the air. The mixture may be partly neutralized with lime or calcium carbonate and evaporated down. This is patented in United States patents Nos. 1,311,215 and 1,311,222.

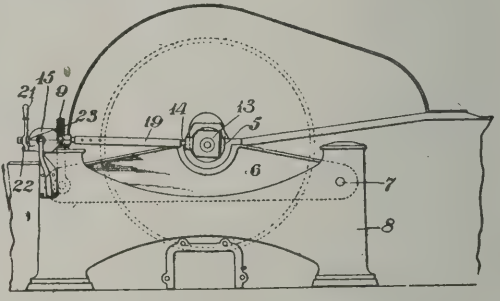
In order to improve the color and adhesive power of the substances derived from the sulphite cellulose waste liquors the liquors can be evaporated under reduced pressure with the addition of acetate of lead, sodium hydrosulphite or sodium phenolate. The evaporation may also be carried out in the presence of organic bases, acids or aldehydes. This is patented in German patent No. 334,870 of 1918.

Water resistant qualities can be imparted by incorporating casein or resinates. Thus, cellulose pitch (five parts) is treated with magnesium oxide (two parts) and the product is incorporated with casein (2.5 parts) and sodium fluorid (one part). This process is patented in German patent No. 353,570 of 1919.

* * *

Raising and Lowering Beater Rolls

A pair of levers are attached to the beater roll and shaft, as seen in the accompanying figure. These levers are provided with screws, which carry worm gear nuts for engaging these levers with a worm shaft.



A telescopic shaft is connected to the worm shaft and is driven by the beater roll shaft. The rotation of the beater thus serves to raise or lower the beater roll. This apparatus is patented in United States patent No. 1,471,480.

* * *

Metal Coated Paper

British patent No. 183,143 is concerned with a process of manufacturing metal coated paper. In making this paper bituminous substances are used as binding agents instead of glue, casein or starch.

The new binding material has the great advantage that it increases rather than detracts from the luster of the coating. The bitumin can be used with solvents which do not evolve oxygen so that the coating may thereby be protected against oxidation.

* * *

Lignin by Hydrochloric Acid Process

A method of preparing lignin by the hydrochloric acid process is described in the journal, Naturprodukte, 1923, pages 24 to 35.

Lignin prepared according to Willstaetter's method by treating pine wood with highly concentrated (45 percent) hydrochloric acid, yields furfural when subsequently distilled with hydrochloric acid. Experiments indicate that the carbohydrate from which the furfural is derived forms an integral part of the lignin molecule. This carbohydrate is removed only by the prolonged action of cold 45 percent hydrochloric acid or by hot dilute acid. The carbohydrate is identified as arabinose, and is present to the extent of approximately 4.5 percent of the lignin.

Among the products of fusion of lignin with alkali, catechol and formic acid were identified. The lignin prepared from pine wood contained 14.68 percent of CH_3O; after freeing it from the carbohydrate the methoxyl content was 15.2 percent. The content of carbohydrate-free lignin in pine wood is 27.5 percent.

Paper Exchange Market Service

(*Continued from page* 13)

Under this new order of things salesmen will be obliged to consider the psychology of time and place, personality, geographical location, square dealing and service. It takes no genius to sell goods on the basis of price cutting unless we are to dignify that system of clairvoyance by calling mind reading, business.

The exchange is the weather vane, the needle of the compass, denoting the direction of values, regardless of the storms, calms, or the unexpected that so frequently arise without notice or warning. It is the barometer to guide the industry to a sane destination. Each group is an entity in itself and it elects its chairman and secretary and formulates, for the purposes of the exchange system of trading and market service, the exact requirements for the betterment of each particular group.

The exchange itself has but two things to consider in connection with group recommendations—the first is legal status and the second is practicability. So far the groups have met with no difficulties in this direction.

Daily Market Reports in Newspapers

A membership in this exchange permits trading in either New York or Chicago, or both, and where members find it inexpedient or difficult to have personal representation orders for execution may be transmitted to either the secretary in Chicago or the manager in New York, without additional expense. In this way the exchanges are available to the use of members regardless of their geographical location; and in addition to all this, arrangements have been made whereby a special column, properly edited, is now a part of the daily routine of the Chicago Journal of Commerce. Through this medium arrangements will also be made to have these quotations and operations on 'change, both for Chicago and New York, appear in the metropolitan morning press with the same assurance of consideration and publicity as that obtainable by any other exchange.

By bringing in the associations to this exchange together with their membership and the formation of a combination of service, including price determination and the research work, there will be welded together for the benefit of this industry the strongest possible chain of valuable service that could possibly be obtainable; and it is the only legal means whereby this entire service may be offered to the industry, including price determination and distribution of price information.

This latter does not indicate a distribution of prices on information received from the members of the exchange, but on the actual transactions, bids and offers that must manifest to our members and to the public and to the buyers and the sellers equally alike the determination of actual values, about the correctness of which there can be no doubt. This is the only vehicle in which the industry can ride with full legal assurance of safety, and the establishment of the principle of cooperation, which in itself means the direct application of the Golden Rule.

Scott Co. Buys a Brand Name

The Scott Paper Company of Chester, Pa., has taken over the exclusive right title and interest in the "Walton" trade mark label formerly owned and controlled by the Peerless Manufacturing company of Norristown, Pa., and used by them on toilet paper rolls.

The assignment of this "Walton" trade mark to the Scott Paper company was made under date of October 16th, 1923."

The Dixie Paper Mill Corporation has been chartered in Norfolk, Va., with a capital stock of $25,000, by C. A. Long, president; E. R. Wilcox, secretary, and others.

Doings in Canadian Paper Field

Labor Shortage in Mills

After visiting all the pulp and paper mills in Northern Ontario, Hon. J. W. Lyons, minister of lands and forests, and party have returned to Toronto with the information that all of the plants are suffering from a labor shortage. The department, moreover, has applications from companies for the erection of ten or eleven new pulp mills or enlargements to existing plants. "If these requests are granted," said Mr. Lyons, "I do not know what will become of the pulp supply of the province."

In a speech at Fort William the minister, pledging the Ontario government to a policy of development in Northern Ontario, said that the greatest menace was from fire and that his department was going to use more efficient methods of protection. Better protection would be given at less cost. Ontario had lost a million acres of forest in three years, sufficient to make a strip of timberland one mile wide from Halifax to Winnipeg.

In Ontario there were now $140,000,000 invested in pulp and paper plants and by 1925 this will have grown to at least $190,000,000. It was hoped by the government that it would be able to link up the establishment of the new pulp mills with new settlement areas, each industry serving as a nucleus for an agricultural settlement. The government had propositions from ten or eleven firms seeking help for pulp limits, but the minister was of the opinion that no pulp or paper company should receive any special privileges from municipalities and should be able to stand on its own without help from the cities. The government did not want to be mixed up with any family feuds between municipalities.

Aftermath of Becker Failure

The unexpected failure of Becker & Co., the well known British pulp and paper firm, has had a disquieting effect in Canadian pulp and paper circles, for not only was Sir Frederick Becker interested in at least one important Canadian company, but his firm had important connections as agents for others.

The Saguenay Pulp and Power Co. has a claim of about $1,000,000 against Becker's; but it is understood that by far the larger part of this will be recovered without loss. Fifty per cent of this claim goes back to 1921 when 18,000 tons of pulp under contract was not taken.

In a statement on the affairs of the Saguenay Co. Senator Beique says that Becker & Co. had been acting for several years as selling agents for the Chicoutimi Pulp Co., the main subsidiary of the Saguenay Co. Last year Chicoutimi, through the Beckers, entered into a contract with a number of English paper mills for a supply of pulp to be taken over a period of ten years on the basis of cost plus a reasonable profit. These contracts, however, cover only a portion of the out-put of the Chicoutimi mills, and there is now keen demand for their products. It seems that a committee of management was arranged to see that the product was up to standard, and on this the Beckers had representation. Differences of opinion arose between the directors and Sir Frederick Becker, and termination of the contract with the Beckers as selling agents had been contemplated some time ago. Action on this matter was hastened by the failure.

The statement concludes: "The president and board of directors of the Chicoutimi Pulp company do not consider that the cancellation of the agency affects the contracts entered into by the company with responsible paper mills of England, and they look on the severance of their relations with Becker & Co., Limited, as having some advantages, among which will be the saving of the larger part of commissions amounting to about $160,000 per annum."

It is also announced that control of the Bay Sulphite company, in which Sir Frederick Becker was interested, passed to Canadian hands some time ago.

American Interests Get Clarke Holdings

The first mortgage bondholders of Clarke Brothers, Limited, of Bear River, N. S., have voted to accept the offer of Chicago and Milwaukee interests for the purchase of the company's properties. By this arrangement the present first mortgage bondholders are to receive second mortgage refunding bonds of a new company to be organized, equivalent to their holdings in Clarke Brothers, Limited, and in addition for each bond held a $50 share of 7 per cent cumulative preferred stock of the new company. The bonds bear interest at 7 per cent, and mature in 20 years.

The new company will operate under a Canadian charter and will proceed at once with operations. It is understood that they are very strong financially.

"Forest Fires Burn Pay Envelopes"

The question of reduction of the fire menace insofar as it affects pulp and paper manufacturing in Canada is receiving the attention at last of Canadian labor leaders.

Tom Moore, who is president of the Canadian Trades and Labor Congress, is calling attention to the loss to workers in unemployment in the mills and in the woods operations of the pulp and paper interests through the forest fires.

Among other pithy statements he makes is this one: "We burn down forests and think we are only destroying some corporation's timber. The more vital fact is that a burning forest burns up pay envelopes."

He points out that the workers should protect the forests, as by so doing they are protecting their jobs, and asserts most of the fires are started through carelessness, such as lighted matches, tobacco, and camp fires. He asks each worker to think the matter of forest conservation over very carefully, as it is a matter of vital importance.

The plant of the Mattagami Pulp and Paper company at Smooth Rock Falls, Ont., has undertaken several improvements of late and is now running to capacity in the production of unbleached sulphite pulp. Several economies have been effected and production costs brought down to a reasonable figure, so that the organization has been able to show some profit on their operations of late notwithstanding the fact that the market price for pulp has dropped from $5 to $10 a ton during the past few months. The Mattagami company has built up a good sales organization which has kept them well supplied with orders. The company has practically no pulp on hand unsold at the present time.

It is reported that the Saint Regis Pulp and Paper company has obtained certain lands from the Canadian National Railways at Cap Rouge, west of Quebec, and that it will erect a pulp mill at a cost of $4,000,000 where 800 men will be employed. The Saint Regis company has important limits on the north shore and at other points of the province.

Paper Makers' Felts

(*Continued from page* 10)

is interested in the actual tonnage produced rather than the time required to put on and take off, for it is the tonnage cost which determines the actual cost of the felt to you.

An example of injury to felts from chemical action came to our attention some time ago when we were called to see a felt which had gone to pieces. When we saw it, there was no mistake as to whether or not it had, for it was literally in shreds. At our request, two other makes of felts were put on with like results, proving the trouble to be local, either chemical or mechanical. To make the story short, it was found that the stock had not been properly neutralized with the attendent result that the acid in the furnish caused the felt to go to pieces within a few days after being put on.

It is a well known fact that deterioration is much quicker in summer not only because of warm water being used, but also because of vegetation in the water which decomposes, rotting the wool fiber in the threads, this being all the more rapid where unfiltered water is used, for under such conditions, the felt will fill up much more quickly.

Mechanical sources of trouble are many and may be classified under two heads: 1.—Excessive tension. 2. —Abrasion.

Were it possible to record the actual tension on felts, we feel certain that they would last longer, for this test would show when the tension was becoming excessive, making it possible for you to relieve the condition. The more rolls a felt travels over, the greater the tension as the felt must act as a belt. Therefore, the necessity of seeing that all bearings are operating as smoothly as possible. This is very apparent on boxboard machines where as many as five, six, and seven cylinders are in operation, all of which are propelled by the felt.

The added stress of the whipper is an additional strain to contend with as is also the case with suction boxes which act as a brake upon the travel of the felt.

The wear due to abrasion is an equally important factor. The whipper should it become worn or roughened in spots as is the case with wooden ones or from loose screws or nails, has its apparent results. Rough spots on rolls soon cut or chaff the thread while the tops of suction boxes shear the nap on such portions of the felt as travels over the roughened part of the boxes. Occasionally we see a used felt which has a light streak worn clear around the felt, running in a straight line, indicating that undue pressure or wear was brought to bear against the felt at that point. These annoying troubles appear so suddenly at times that it requires the most constant vigilance in order to avoid any serious loss of production or damage to machine clothing.

The proper crowning of rolls, which is a very familiar subject to you all, has its affect upon the successful operation of the felt. A complaint received at one time was of a felt being satisfactory on one side of the center of the felt but not so on the other. An examination showed the pressure on the back side of the felt to be greater than on the front. Equalizing this removed the difficulty.

In conclusion, let it be said that while the history of felt manufacturing is one of progress, the industry is very anxious for greater accomplishments so that we may serve you even more effectively. This is being made possible through the splendid cooperation extended to us, not only by the individual superintendents but through the concerted action of the different associations.

That this pays good dividends is proven by the fact that the best results in the paper industry are obtained in mills where the best cooperation is received, for it is in this way that the felt manufacturer can best determine the exacting requirements of each individual mill.

Timber Lessee Must Erect Mill

The Quebec government is opposed to the placing of an embargo on exports of pulpwood cut on privately owned lands in Canada, but realizing the necessity of making provision as far as possible that the timber shall be manufactured in Canada, it has so drafted the terms of a lease of valuable timber limits to be auctioned near the end of November as to ensure this development. The limits are situated in the basin of the Minicouagan river and located next to those leased some time ago to the Ontario Paper Co.; they also contain very valuable water powers.

It is provided that the successful tenderer within the next five years must erect a mill within a distance of eight miles of one of the 22 cities or towns in Quebec. The mill is to save a daily production capacity of at least 200 tons of pulp and 100 tons of paper, and within seven years after the signing of the contract the daily capacity must be 200 tons of paper. By this means, it is hoped that much work may be provided and capital attracted to Quebec.

Test of Exemption Order

As there is much interest in the order in council passed by the Canadian government exempting for ten years from any embargo, exports of pulpwood under contract dated not later than June 1st, 1923, it is herewith reproduced:

"His excellency the governor-general-in-council on the recommendation of the Right Hon. W. L. Mackensie King, the prime minister, and under and in virtue of the powers conferred by the Export act as amended, is pleased to order and doth hereby order and declare, with reference to the provisions of an act to amend the Export act, chapter 46 of the statues passed at the recent session of parliament, that whatever regulations may be made thereunder regarding the export of pulpwood from Canada, such regulations shall not be made applicable to or effect the exportation of pulpwood exported in fulfillment and in pursuance of bona fide written contracts duly executed and delivered previous to June 1, 1923; provided, however, that in the case of contracts calling for deliveries over a period of more than ten years from the date hereof the exemption hereby granted shall not extend beyond the period of ten years from the date hereor."

Frank Harris Anson

The Canadian pulp and paper industry has sustained a severe loss through the death of F. H. Anson, president of the Abitibi Power and Paper company, who succumbed after a short illness in Montreal on November 1st.

He was born in the United States and after having spent some time in business in Minneapolis came to Canada, and thus was numbered among the many Americans who have made good in the Dominion. For some years he was with the Ogilvie Milling Co., after which he went to the Atlantic Sugar Refineries, Limited.

His most important work was done in connection with the upbuilding of the Abitibi Company of which he became president in 1914. From the time of his first connection with this organization he was untiring in his efforts to promote its success, and had the satisfaction of seeing it grow into one of the largest paper producing plants in Canada and thus in the world.

He began with nothing but a general knowledge of the industry, but the principles that made for success in other lines were applied with equally good results, and he soon become recognized both in Canada and in the United States as one of the dominating personalities in the industry. The late Mr. Anson was a man of varied activities, his work in promoting good roads being well known.

Commission Raps Barnjum

The sessions held by the Canadian Pulpwood commission continue to be characterized by a preponderance of anti-embargo sentiment. At the session held in Bathurst, N. B., a petition was filed signed by ninety farmers, protesting strongly against an embargo, and stating that if the embargo were imposed they would be left at the mercy of the Canadian companies, which meant much lower prices than they have been receiving from the United States companies.

Chairman Joseph Picard of the commission condemned F. J. D. Barnjum of Annapolis Royal, N. S., for failing to appear before the commission although the commission had endeavored to have him appear and testify. He asserted it was useless for Mr. Barnjum to continue writing letters to the newspapers and to the commission. Mr. Picard had that day received a letter from Mr. Barnjum in which the latter accused the commission of being on a joy ride at the expense of the Canadian tax-payers and suggested that the commission cease holding sessions and act on the information which he claims is already in hand in Ottawa.

Mr. Barnjum refuses absolutely to give evidence, stating the investigation is a farce. He reiterated that his interest was solely for Canadian pulpwood and declared the United States pulp and paper companies had organized a fund to combat the threatened embargo and were spending much money to influence public opinion in Canada at present. He says he will continue to fight for an embargo, terming it the proper means for pulpwood conservation.

H. F. G. Kent, Toronto, president of the Canadian Pulp and Paper Trade association, had as a guest last week a prominent figure in British pulp and paper circles, in the person of C. R. Seddon, managing director of the East Lancashire Paper Mill company, Limited, Radcliffe, near Manchester. Mr. Seddon is president of the Paper Makers' association of Great Britain and Ireland, and is also president of the Employers Federation of Paper Makers of the United Kingdom. While in Canada Mr. Seddon met many of the leading pulp and paper men and exchanged ideas with them. Another British visitor was Thomas Armstead, a director in the firm of Thomas Owen & Co., Ltd., Ely Paper Works, Cardiff.

The Rudd Paper Box company, Toronto, gave their employees a couple of hours' holiday during the visit of Lloyd George to the city, rigged up a radio set, had the factory people gather in the recreation room and gave them the Welshman's speech over the wireless, together with songs by Clara Butt, who was singing at Massey hall platform following Lloyd George's address. As thousands were unable to gain admittance to the hall the employees appreciated the efforts of the Rudd management to entertain them.

The St. Jerome mill of the Rolland Paper company in Quebec has been closed down for several weeks while a new water wheel is being installed. It will be several weeks before the work is completed.

Paper and Board

New York, November 13—Firmness is the outstanding characteristic of some branches of the paper market, irregularity of others. Viewing the industry in its entirety, there is no question but that normal activity exists; if anything, the present scope of business is slightly above normal, yet there are some divisions of the market which are featured by conditions far from the liking of manufacturers and jobbers.

There is no doubting that the pre-holiday demand for certain kinds of paper, which ordinarily is in full swing at about this time, has not developed this year in the volume anticipated by members of the trade. Consumers are still pursuing a most careful policy in the purchasing of paper. Instead of stocking up as is the customary procedure at this season, the tendency today is to keep stocks down to as low as requirements will permit, so that current demand for many kinds of paper is strictly of hand-to-mouth character and lacking the volume which manufacturers had hoped for at about this time.

Newsprint is the shining exception to these market conditions. There is a heavy movement of print paper into consuming channels; publishers, from all indications, cannot secure all the paper they want despite the fact that mills are working at a record-breaking pace and are producing by far a greater tonnage of newsprint than ever in their history. The big demand for print paper is due to the record amount of advertising in the daily press. It would seem as if there is no limit to the volume of display advertisements. Notwithstanding that publishers are putting out larger issues than ever before they are compelled to omit many columns of advertisements, and this holds true with those newspapers which are gradually adding more and more pages to their issues.

One of the afternoon dailies in New York on the day prior to Election Day published 242 columns of "spontaneous" advertisements the largest amount of advertising this newspaper ever printed in a single issue. The issue was 44 pages. Another afternoon paper published an issue of the same number of pages on the same day. The morning newspapers are equally as crowded with advertisements, and are publishing as large issues as their mechanical facilities will allow. The same situation prevails in all of the large cities of the country, thus explaining the tremendous consumption of newsprint.

The market for box board has developed additional easiness. Prices of plain boards have sagged badly in the East, and while most eastern mills are quoting news and chip board at $55 per ton f. o. b. New York, they are shading this price frequently. In fact, it is apparent that consumers are securing some supply of board down to $50 a ton New York and if waste paper—the principal raw material of board mills—continues to go lower in cost it seems likely board prices also will move off further. Demand for box boards thus far this season has been disappointing. Paper box manufacturers have not bought in their customary tonnage and mills in a majority of cases are in want of orders. In the West producers are reported granting even sharper price concessions on board than in the East notwithstanding that statistics would show that relatively better buying is being engaged in there than in the East.

Book paper prices are merely holding their own and no changes of consequence have occurred. Mills are moderately busy but desire additional business and are not hesitat-

CURRENT MARKETS—Continued

ing to cut under competitors' quotations to land orders. Fine papers are in fair demand. There was quite a flurry of buying in the New York market during the middle of last week but it lasted only for several days, which is characteristic of the prevailing situation, demand being very spasmodic.

Less activity is noted in building papers, which is due to the season, but bag papers are moving in large amounts and at firming prices. An official of one of the largest sack paper producing companies reports the mills of his company very busy, and sold well ahead. Wrapping papers are fairly active, and so are tissues but the markets for such paper lack feature.

Mechanical Pulp

Ground wood is in a firm market position, and some of the reports from Canada state that grinders across the border are securing new high prices for their pulp. Domestic ground wood is quoted at an approximate average of $42 per ton f. o. b. producing plants, prices depending on the air dry basis and the freight rates from grinding plants to consuming points, while in Canada it is said producers are getting in excess of $50 a ton at pulp mills for ground wood for prompt shipment, up to $55 a ton having been mentioned. One thing about the market seems sure and that is a ready sale exists for virtually all the mechanical pulp being produced at present. Stocks are low and the statistical position is quite bullish especially with the winter approaching, when manufacturers usually have to curtail their output because of frozen mill streams.

Foreign and Domestic Chemical Pulp

Prices of chemical wood pulp are so irregular and uncertain that it is a question what figures really constitute market levels. Consumers say they do not know how cheaply they can buy, and sellers admit they are not aware what they can secure for pulp in current sales. Prices differ on nearly every lot of pulp on the market. Some importers and producers are anxious to dispose of stocks and are sacrificing pulp at prices under those at which they can replace the stocks sold; on the other hand, there are many firm holders who are maintaining quoted rates

CURRENT MARKETS—Continued

and who contend they will be able to obtain the prices asked in the not distant future. In a market such as now exists quotations mean little for the reason that they can scarcely be accurate unless on such a wide range that they lose their value. No. 1 unbleached sulphite is said to have been sold down to 2.75 cents a pound f. o. b. domestic pulp mills, and ex dock New York. Kraft pulp is particularly weak and is reported available at 2.75 cents on the dock New York and less for No. 1 foreign kraft. Quotations ex dock New York and f. o. b. pulp mills are nominally as follows:

Sulphite foreign—			
Bleached No. 1..	4.00	@	4.50

Sulphite screenings, refined	1.75	@	2.00

Domestic Rags

Quoted prices of most grades of papermaking rags have moved off a little. Roofing stock has declined about $2 a ton to around 1.45 cents per pound for No. 1 packing and 1.25 cents for No. 2 quality f. o. b. New York, and probably some transactions have been at even lower rates. Thirds and blues display a sagging trend, with repacked quoted at 3 cents per pound or slightly less at dealers' shipping points and miscellaneous packing at around 250 cents. Old white rags are quotably steady but demand has diminished and there is not the upward tendency in values that recently was noticeable. New cuttings are quiet and buyers are securing most grades at slight concessions at least. F. o. b. New York quotations are:

New Shirt Cuttings,			
No. 1	12.50	@	13.00
No. 2	6.00	@	6.25
Fancy Shirt Cuttings	6.00	@	6.25

CURRENT MARKETS—Continued

Bagging, Rope, Etc.

Old manila rope is one item in the papermaking raw material list which is decidedly firm in price. Mills using this article are buying in a consistent manner, and there are indications that not much old rope is in the hands of domestic dealers while rope prices abroad are strong and inclining upward. No. 1 domestic manila rope is quoted at 6.50 cents a pound or higher f. o. b. New York, and foreign No. 1 manila rope at about 6.25cents ex dock at this port. Old bagging is in slack demand and rather nominal in price at about 1.25 cents New York for No. 1 scrap bagging and 90 cents to $1 a hundred pounds for roofing bagging. F. o. b. New York prices follow:

Gunny, No. 1	1.30	@	1.40	Wool Tares, heavy .	1.40	@	1.60
Foreign	1.20	@	1.30	For. Manila Rope .	6.00	@	6.25

Roofing Bagging ..	.90	@	1.00				

Old Paper

Sharp declines have occurred in prices of old paper. The price position is so weak it would appear as if there is no bottom to values, and little hope for improvement is entertained until demand picks up from board manufacturers, who at the moment are buying in very limited volume. Old folded newspapers are down to 85 cents a hundred pounds f. o. b. New York, and No. 1 mixed paper is selling at 60 cents per hundred pounds NewYork. Flat magazines have declined in price to 1.65 cents a pound f. o. b. New York, and both hard and soft white shavings are lower, the former being offered at 3.80 cents per pound New York and the latter at 3 cents. Overissue newspapers have sold at 1.15 cents per pound New York, and No. 1 old kraft at 2.15 cents. F. o. b. New York quotations are:

No. 1 Hard White Shavings	3.80	@	4.00	Kraft No. 1	2.10	@	2.20

Chemicals

A moderately good demand prevails for papermaking chemicals, with the principal movement on contracts. Quoted prices are generally maintained without alterations of consequence.

We Aim to Please

CURRENT IMPORTS

IMPORTS AT NEW YORK

Week of November 5-10

Paper

Str. Litunia, Libau—H. Reeve Angel & Co., 4,100 rolls wrapping.

Str. Stavangerfjord, Christiania—American Exchange National Bank, 104 rolls newsprint; Irving Bank-Columbia Trust Company, 111 rolls newsprint.

Str. Berengaria, Southampton—A. C. Dodman Jr. & Co., 34 bls. hanging; G. W. Sheldon & Co., 17 cs. writing; Whiting-Patterson Company, 9 cs.; Thomas & Pierson, 1 cse. hanging; A. Murphy & Co., 2 cs. writing.

Str. Belgenland, Antwerp—Borden & Riley Paper Company, 11 cs.; Geveart Company of America, 51 cs. photo; P. Puttmann, 25 cs. printing; C. W. Williams & Co., 9 cs.; P. C. Zuhlke, 54 cs. printing

Str. Bristol City, Bristol—B. A. T. Company, 68 bls. cigarette.

Str. Carmania, Liverpool—F. C. Strype, 22 cs. tissue.

Str. Seydlitz, Bremen—Globe Shipping Company, 88 cs. and 4 cs. drawing; Hensel, Bruckman & Lorbacher, 3 cs. drawing; Friedman & Co., 14 cs. cardboard.

Str. Asia, Marseilles—F. C. Strype, 13 cs. writing; E. Dietzgen & Co., 7 cs. writing; Sternberg & Co., 44 cs. writing; from Lisbon—Zorro Tobacco Company, 24 cs, cigarette.

Str. Minnewaska, London—W. J. Byrnes & Co., 1 cse.; W. H. S. Lloyd & Co., 9 bls. hanging; H. Reeve Angel & Co., 8 cs. drawing.

Str. Nevisian, London—F. L. Kraemer & Co., 4 cs. writing.

Str. Chicago, Havre—H. Reeve Angel & Co., 1 cse.; H. B. Lloyd, 1 cse.; Southern Pacific Company, 3 cs.; M. Spiegel & Sons, 3 cs. cigarette; A. Murphy & Co., 2 bls. hanging; Dupont Cellophane Company, 22 cs.

Str. Derfflinger, Bremen—Toronto Terminal Warehouse Company, 4 cs. drawing; E. Weiss, 8 bls.; Order, 1,876 rolls wrapping.

Str. Kungsholm, Gothenburg—American Express Company, 2, 851 rolls and 6 bls. wrapping; Chatham — Phenix National Bank, 132 rolls wrapping; Arkell Safety Bag Company, 22 rolls wrapping; Japan Paper Company, 15 cs.; O. M. Baxter, 40 bls. wall board; Irving Bank-Columbia Trust Company, 124 rolls wrapping; Bernard, Judae & Co., 6 cs. filter; American Trading Company, 1 cse.; Order, 2,582 rolls and 134 bls. wrapping and 1,006 rolls newsprint.

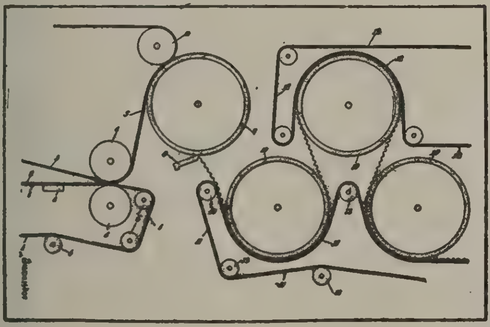
Improved Process of Creping Paper

The Best and Most Profitable

For the manufacture of CREPED PAPER Napkins, Toweling or Stretchable Bag Papers and Creped Packing or Crepe Wrapping Papers the system has no equal



The crepe being formed while the fibres are steaming hot and pliable is dried without stretching; not only retaining form better, but shedding less lint than cold creped paper products.

For particulars address:

Tompkins-Hawley-Fuller Co.
VALATIE, N. Y., or OREGON CITY, ORE.

Hamilton Board Felts

OUR style No. 82 top felt and style No. 87 bottom felt have the bulk of the filling threads on the face of the fabric. This style of weave causes the felts to give a smoother finish and longer service than can be secured from plain weave board felts, besides shedding the water better. They do not "roll on the edge" and are billed at the same list and pound prices as are our plain board felts.

ORR FELTS and JACKETS

Lowest Cost per Ton

If you judge felt values, not by what you put into the equipment, but what you get out of it—then you will specify ORR 3 stripe Endless Felts for ORR felts will produce the lowest cost per ton. They "stand up" under severe usage. Orr durability is acknowledged everywhere. Their strength and long life are as dependable as their reliability and quality.

In the 32 grades of Felts and Jackets we can match your most exacting demands. Tell us the kind of paper you desire to make, and we will send you samples of felts that will economically serve you and help you to produce paper at lowest cost per ton.

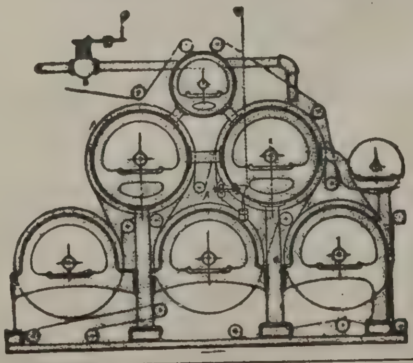
THE PICKLES DRYING REGULATOR



Reasons why you should have it on your machine are: First, it regulates the drying of paper automatically, irregularities are eliminated; second, higher machine finished papers are attainable, because it is possible to maintain the proper quantity of moisture in sheet, as it passes to calenders; third, mills having tried it on one machine have ordered it for all their machines. Graphical Control Combustion Gases

Rapid and Convenient Method for Determining Relation Between Gases Formed in Sulphur Burning and for Finding Dioxide Content of the Gas

By **Rudolph Sieber**, *Kramfors, Sweden*

THE method of controlling the operation of sulphur burners described in this article is the same in principle as the method used in regulating the operation of boilers with a few modifications to render the same applicable to the combustion of sulphur and pyrites. This is a subject of interest to every paper mill in which sulphite pulp is made.

The combustion gases which are evolved by a sulphur burner contain nothing but sulphur dioxide in the ideal, theoretical case. This gas is mixed with nitrogen and traces of other gases commonly found in air. The maximum sulphur dioxide content of such combustion gases is 20.8 percent or, in round figures, approximately 21 per cent, writes Dr. Sieber in Zellstoff und Papier, May, 1923.

However, when air is present in excess the following equation holds good:

$SO_2+O_2=21.$ (1)

Then, again, when sulphur is burned to sulphur dioxide there is always a certain proportion of sulphur trioxide present in the combustion gases. The question now arises, what is the relation between these three gases, sulphur dioxide, sulphur trioxide and oxygen?

Relation Between the Three Gases

It is quite immaterial for the purpose of this study whether the trioxide is formed directly during the combustion process in accordance with equation 2 or in the first instance by oxidation of sulphur dioxide after combustion has taken place in accordance with equation 3. The two equations, representing the formation of sulphur trioxide, are as follows:

$2S+3O_2=2SO_3$ (2)

$2SO_2+O_2=2SO_3$ (3)

It may be assumed that sulphur burns only with the formation of trioxide along with dioxide. This takes place in air containing one part of oxygen by volume to 3.8 parts of nitrogen by volume. If this calculation is carried out on the basis of unit weight of one kilogram, then the relation indicated in equation 1 holds good.

As the maximum sulphur trioxide content becomes equal to 14.9 percent under these conditions it is possible to write the following equation representing the combustion gas diagram of a sulphur burner:

$SO_2+SO_3\ (1+0.40)=O_2\ \ 21$(4)

Graphical Form

From this equation it is easily seen that the graph will take the form of a triangle with equal legs, as both sulphur dioxide and oxygen have the same maximum values. The hypothenuses of the right triangle are found in exactly the same manner by drawing parallel lines with equal sulphur trioxide values.

In order to introduce the air factor into the triangle which is obtained in this manner, the following equation is used:

$\text{Air Factor}=1-\frac{3.8O_2}{N_2}$ (5)

In this case this equation takes the simple form

$\text{Air Factor}=1-0.0476\ O_2$ (6)

For the nitrogen content in the gas must always equal 79 percent when the sulphur is completely burned to sulphur dioxide. By inserting different values of the air factor in equation (6) it is easy to find the scales for the air factor line on the hypothenuse of the right triangle, in other words, the lines of complete combustion. However, inasmuch as the divisions are equal over the entire length of the line both the mathematical and graphical work is much simplified.

The following equation serves for the horizontal leg of the right triangle, the line of selective combustion to sulphur trioxide:

$$\text{Air Factor} = 1 - \frac{3.8(O_2 - 1.5SO_3)}{N_2} \quad (7)$$

Inasmuch as equation (4) holds good for this line under the special cases where sulphur dioxide is equal to zero and, furthermore, as the sum of sulphur trioxide, oxygen and nitrogen is equal to 100, it is also possible in this case to find the individual values of the oxygen or sulphur trioxide corresponding to the air factor. Then, because the divisions on this line are all equal to one another, as may be determined by making a few calculations, the calculation or the graphical determination of any point in question is considerably simplified. In the case where air factor equals unity, O_2 must be equal to $1.5SO_3$ and from this, with the aid of equation (4), it is calculated that the value of O_2 is 10.4. Hence the point in question lies almost in the exact middle of the horizontal arm of the right triangle and all that remains is to scale the two halves of the line in equal division.

Figure 1 shows the triangle drawn for the case of the combustion of sulphur. The following tabulation shows the manner in which the calculation is carried out:

Combustion of one kg. of sulphur to SO_3	Combustion takes place in accordance with following equation	Amount of oxygen required for one molecule of Sulphur	Total Oxygen molecular	Nitrogen mixed with it	Composition of gas	Molecules	%
1 kg. S	$2S\ 3(O_2\ 3.8N_2)$	1.5 mol.	46.9	178.3	SO_3	31.3	14.9
31.25	$2\ SO_3\ 11.4N_2$				N_2	178.2	85.1
mol.	2 volumes					209.5	100.0

(Dr. Sieber discusses in detail the combustion of iron pyrites and the determination of the right triangular diagrams and the divisions on the arms and hypothenuses, but this part of the article is not of any special interest to the American paper industry, which uses sulphur exclusively and accordingly it is omitted.—Translator).

Determination of Sulphur Dioxide

In the determination of the sulphur dioxide content of gas obtained by the combustion of sulphur, it is generally customary to reduce the results to normal conditions, that is to a temperature of zero degrees C and a pressure of 760 millimeters. But this may give a rather false impression of the exact status of affairs under certain conditions. Very often the gases that are drawn from the burners for analysis possess temperatures as high as 25 degrees and over and a false deduction, converting the gas to the standard volume and pressure, may show the result that is really obtained in the burners in quite different form. In the cases where larger samples of the gas are taken for analysis the gas is apt to cool off considerably before the analysis is completed, and even though the apparatus used in making the analyses is located in the immediate neighborhood of the sulphur burners, variations may occur in the temperature of the gas sample, although at times the temperature may remain constant.

The exact calculation of the sulphur dioxide content of the gas presupposes taking into consideration the barometric pressure. However, the effect of variations in the atmospheric pressure from the normal is far less potent than the action of temperature. For this reason pressure corrections need not be applied to the results.

When the temperature of the gas sample is taken into consideration, which temperature can be readily determined by means of a thermometer, the correct percentage of sulphur dioxide in the burner gases is found from the following equation:

$$SO_2 = \frac{10.95}{\frac{\text{water run out of apparatus} + 10.95}{(1+At)}}$$

In this equation the factor A is equal to 1-273 when ten cubic centimeters of tenth normal iodine or alkali solution are used up. Hence, it is not necessary to reduce the value 10.95 to normal conditions, but the volume of water that runs out. This corresponds to the volume of gas that is sucked in after deduction for the sulphurous acid that is contained in it. The quantity of the latter is always the same under all conditions when ten cubic centimeters of tenth normal iodine solution or of alkali are used and the gas is sucked through the same until the color is removed or the color is changed. The ten cubic centimeters of the standard liquid always oxidize or neutralize 10.95 cubic centimeters of sulphurous acid under normal conditions.

In order not to require the carrying out of a calculation according to the above equation each time an analysis is completed, a graphical method has been devised which is shown in figure 2.

Graphical Method for Simplifying Calculations

The use of the scales shown in the figure is so simple that any laboratory assistant can readily employ them after having been shown how they must be used.

The first thing is to find the observed temperature on the scale 1, then the volume of the water that flows out of the apparatus, being displaced by the gas, is found in scale 2. The line which is drawn joining these two points cuts scale 3 at a point which shows the volume of the water reduced to standard conditions or the volume of the gas directly.

It is necessary to make the correction particularly in the case where it is desirous to make a separate

Water Conditions for Papermaking

Difficult to Find Large Volume of Best Water—Necessity for Controlling Stream Pollution to Protect that Source of Mill Supply

By L. M. Booth
Booth Chemical Company

As a general proposition, a pure natural water supply should be sought in order to make paper economically. However, in the selection of a paper mill site, the availability of raw materials—fuel, power, labor supply—and proximity to markets usually receive consideration before the quality of water is given attention. This is not an unreasonable procedure, and because modern methods of water purification have materially simplified the papermaker's water problem, no insurmountable difficulties need be encountered in perfecting a suitable supply under almost any circumstance.

Soft Water Spring Best Source of Supply

Perhaps the best water is derived from a soft water spring. Such water is free from organic coloring matter and from hardening calcium and magnesium salts. In common with other surface supplies, public records are frequently available as a guide as to the probable volume of dry weather flow.

The next best source is a soft water well. The development of such a source is frequently disappointing. Often the manufacturer is prompted to seek a paper mill supply of water from wells for the reason that there is nearby a satisfactory well yielding a limited supply. Frequently the extent of the tributary water bearing strata is unknown. Untold millions of dollars have been spent in the hope of developing underground supplies adequate for paper mill use, merely because a small well in the vicinity yields a satisfactory water supply for limited uses.

In many instances paper mill water supplies are obtained from hard water wells. Where the volume available is adequate, as in many places in the Miami valley in Ohio, the users are reconciled to the hardness, since they have become accustomed to it for paper making. The presence of large amounts of mineral salts, especially bicarbonates of calcium and magnesium, is of course objectionable. The occurrence of these minerals necessitates periodical cleaning of the wires and felts with dilute acid to remove the incrustation which they cause. Another disadvantage of such alkaline waters is that they require more of sulphate of aluminum for sizing than do soft waters. Where the water supply is thus highly mineralized, it has become the general practice to treat the boiler feed water separately in a water softener.

Surface supplies which require purification may be classed as follows:

1. Clear water occasionally turbid.
2. Colored water occasionally turbid.
3. Habitually turbid water.
4. Water subject to industrial pollution.

The degree of purification required is dependent upon the kind of paper to be made. With building paper and the cheaper grades of board it is sometimes possible to use the water without any purification. Frequently screening through fine mesh wire is sufficient purification for news and wrappings. For other kinds of paper surface waters require filtration through sand, usually preceded by adequate coagulation. For the manufacture of either white or delicately tinted papers, where the water is derived from surface sources as listed above, coagulation and sedimentation must be resorted to in order to effect satisfactory purification. Fortunately, in the present state of the art of water purification, the paper manufacturers can, at moderate price, obtain the desired extent of purification of almost any natural water supply.

The presence of industrial wastes in the mill supply frequently presents perplexing problems. In many parts of the United States stream pollution is tolerated to an extent far beyond that permissable in Europe. The problem of water purification for a paper mill making fine white paper on the same stream and below an establishment where steel is pickled of where wool is washed, is more complicated than removing the natural impurities from the water which prevailed before the establishment of the polluting industries up-stream. Many paper manufacturers suffering from industrial water pollution are reluctant to raise vigorous objection to the practice of stream pollution by up-stream neighbors because they realize that they too contribute towards stream defilement.

Necessary to Control Pollution

In some of the states the authorities require the treatment of certain industrial wastes before these are returned to streams. The continuously increasing amount of industrial pollution, as well as the commercial development of purification processes, indicate that a marked activity in this class of work may be expected during the next few years. The hopeful aspect of the situation, however, lies in the direction of eliminating stream pollution at a profit. In many instances this has been accomplished and is standard practice for certain paper mill wastes. Other developments now in the experimental stage promise to make it possible to eliminate some of the most objectionable wastes not leaving the paper mill.

In any discussion of "The Best Water Conditions for Paper Manufacture" a word in regard to the misuse of water is in order. Perhaps the readiest means of reducing the toll which the mill sewer takes is the intelligent use of the white water. As an example of misappropriation of this valuable by-product, some mills which filter their mill supplies still use the white water for washing pulp. In any event much of the beaten fibre of the white water is lost in the washing. In addition, the use of white water carrying sulphate of aluminum for washing any alkaline stock is by no means good practice. Obviously the first thing that happens is the formation of an aluminum hydroxide precipitate. This flocculent substance gathers up the colloidal ink, clay, etc., and in this condition is not readily washed out of the stock. Where this procedure is followed the use of more water than would otherwise be ample is required for washing the stock.

The Crescent Paper Bag Co., of Covington, Ky., has increased its capital stock from $10,000 to $40,000.

Gas to be piped to West Monroe, La., for the Brown Paper Mill Co. from near Bastrop, Tex., to be used as fuel and light for the operation of entire plant.

Heat Losses in Machine Room

Review of Systems Used in Various Mills and Data Showing Results in Use of Open, Hooded and Closed Systems—Proof that Open System is Expensive

By E. P. Gleason and F. C. Stamm

Chief and Assistant Engineers, Nekoosa-Edwards Paper Co.

IT has been previously pointed out that steam power constitutes about 36% of the conversion cost in the average paper mill, and is the largest single item, exceeding labor by 10%.

The largest use of steam is in the machine room and this paper will be confined to heat losses in this department. The writer has recently had the pleasure of visiting many of the large mills in the Eastern United States and Canada and was particularly interested in this subject.

Heat Loss in Piping and Dryers

Steam in the machine room goes through engines or turbines or direct through reducing valves to the dryers and air heaters. It will surprise you to go through good mills and note: (a) Uncovered steam pipes both live and exhaust; (b) Leaky steam joints and pipe threads; (c) Exhaust blowing to atmosphere either constantly or during washing up periods; (d) Machine dryers shut off, causing increased steam pressure for drying paper. This means greater back pressure on the prime movers with loss in efficiency as well as poor speed regulation.

You can see the above losses. But you cannot see (e) Broken syphon pipes or buckets; (f) Machines that are blowing through to hotwell to get circulation; (g) Leaky valves and traps; (h) Clean condensate used for process work where it should be returned to the boilers. All of these are serious and deserve the best attention of the superintendent and engineers.

The modern mill does not allow any steam to blow through to the hotwell. All steam traps and valves are periodically checked to insure their being tight. Circulation in dryers, removal of air and the very important item of graduated temperature from the wet end to the dry end of the paper machine is obtained by a P. O. Woodsome or similar circulating system. It is not uncommon to see a machine that formerly carried 10 to 15 pounds steam pressure on all dryers doing better with a graduation of from 10 inch vacuum at the wet end to 6 pounds at the dry end with maximum quality of paper and minimum steam cost.

We predict that in the near future all machines will be equipped with separate steam flow meters measuring the steam to driving units and dryers. In the case of Yankee machines this meter should include the steam to hood air heaters. Separate meters should be used for steam used in heating, thus separating heating and process steam costs.

Air Heat Losses

Under present conditions there are three classes of machine rooms, (a) The open room; (b) The room with hoods over the machines; (c) The latest development where the dryers are entirely enclosed with the exception of the front side.

(a) The Open Room.—There are still some machines in open rooms and there are still some misguided advocates of this practice, but we believe we are safe in saying that there is no excuse for this practice in the light of modern engineering and experience.

(b) The hooded machine is accepted as standard today and except for the heat losses has been very satisfactory, especially where it is built of insulating material and where the air supply is properly laid out.

There has been a recent tendency toward open pits in which the bottom felt is cooled and aired. This practice is questionable, and recent tests have shown a decided cooling of the paper on each bottom dryer and a heating up at each top dryer where there should be a gradual increase in temperature throughout the machine. The remedy is more felt dryers and the introduction of warm air in a closed pit.

(c) The Enclosed Dryer Unit.—This has been successfully tried in several cases and its value proven. The usual practice is to build a roof over the dryers extending down to the top front frame and back to the wall. The ends are closed. The pit is closed. Air comes from the pit and from the room and all air goes through the machine from front to rear. It is then taken out through economizers where maximum heat recovery is made.

Advantages of the Closed System are:

(1) A clear dry room.
(2) Maximum comfort for machine crew.
(3) Minimum depreciation of machine building.
(4) Lower drying cost due to less volume of air required.
(5) Lower economizer cost if economizers are used.
(6) Increased production—about 10%.

Disadvantages of the Closed System are:

(1) Higher cost of hood.
(2) Space back of machine is closed in and is too hot to work in while running.
(3) The question of uniform drying across the sheet with all air passing through dryers. This does not appear to be serious in actual practice. As the air travels across the dryer fan it is heated at the same time that it is picking up moisture and with proper control the absorption can be made practically uniform.

The Yankee is another type of a closed dryer machine.

The following example will illustrate the three types of machine rooms:

A machine making thirty tons of paper in twenty-three hours will evaporate 87 pounds or 609,000 grains of water per minute with 69% moisture to dryer and 8% from dryers.

Machine Data

Item	Name	A Open	B Hooded	C Closed
1	Temperature of air leaving	105°F	120°F	140°F
2	% Saturation of air leaving	70	90	90
3	Carrying capacity of air Gr. per ℔.	248	512	965
4	Moisture in incoming air (80°F. 40% R. H.)	62	62	62
5	Air can pick up (Gr. per ℔.)	186	450	903
6	No. min. air required.	3270	1350	675
7	Total B. T. U. Per Pound.	66	112	195
8	Total B. T. U. per min. leaving machine	216,000	151,000	131,500
9	% Saving over open room		30%	39%
10	% Saving closed machine over hood			13%
11	Dollars per year saving over open room		$12,500.00	$16,400.00
12	Dollars per year saving over hooded machine			$ 3,900.00

The above figures show a 30% saving of the hooded machine over the machine in an open room and a further saving if the dryers are enclosed. Average conditions have been taken in this example. It is understood that conditions will vary somewhat in each mill. These figures are for machines only.

The Story of Fourdrinier Wires*

Origin and Growth of Wire Making Concerns in the United States—How Wires Are Made—Why Care in Handling Is Necessary

By G. E. Buchanan
Appleton Wire Works

I HAVE been asked to talk with you this afternoon regarding a product which is essential in the manufacture of paper. This is the manufacture of papermakers wires, which includes Fourdrinier wires, cylinder wires, washer wires, saveall wires, etc.

The history of the Fourdrinier wire industry in the United States covers a period of exactly three-quarters of a century. This is not a long period of time when we consider that many men now living were good sized boys when the first paper machine wire was made in this country.

Previous to 1848 the comparatively few paper machine wires used in this country were imported from Europe, largely from Great Britain. In 1847 my grandfather, Robert Buchanan, came to the United States from Scotland to work at his trade of Fourdrinier wire weaving in a weaving shop then being built at Jersey City, N. J. The plant was about ready to begin operations when one night it burned to the ground and this plant was not rebuilt.

The year 1848 marks the beginning of the Fourdrinier wire industry in this country. It was in this year that William Cabble Excelsior Wire Mfg. Co., Brooklyn, N. Y., and also the Staniar & Laffey Wire Co., of Newark, N. J., were established.

In those early days the few Fourdrinier machines in the United States required wires that were narrow and short. A wire 72 inches wide by 40 ft. long at that time was considered a large wire. The speed at which these early machines ran was also very slow compared with the speed at which paper machines are now operating. I remember when the first loom was built to weave wires 100 inches wide, and this loom was a nine day wonder.

Historic Resume'

During these 75 years the paper industry, this imperial industry, has expanded in progress by leaps and bounds. The manufacturers of Fourdrinier wires have exerted every effort to keep step with this progress and to meet these rapidly changing conditions as to speed, width, stock, etc. The old wire weaving plants have increased and enlarged their equipment, and from time to time new weaving plants have been established.

In the early fifties William Stephens and sons commenced the manufacture of paper machine wires at Belleville, N. J., this plant later becoming the De Witt Wire company. In this weaving shop Robert Buchanan worked as a wire weaver and my father, William Buchanan, learned the wire weaving trade. In 1876, Robert Buchanan with his sons moved to Holyoke, Mass., and established the Buchanan & Bolt Wire Co. In the same year my father left the employ of the De Witt Wire Co., and established the Centennial Wire Works at Bloomfield, N. J., with Charles Smith, a wire drawer. In 1878 this business was moved to Belleville, N. J., and John Eastwood was admitted to the firm. This business was conducted for several years under the name of Eastwood, Buchanan & Smith, and later incorporated as the Eastwood Wire Mfg. Co. A few years earlier the W. S. Tyler Co., plant was established at Cleveland, Ohio, and for many years the Tyler Company was the manufacturer of Fourdrinier wires the farthest west. As the years passed other Fourdrinier wire weaving plants were established in various parts of the country and at the present time there are in the United States about 20 manufacturers of Fourdrinier wires, which have practically all branched out from those I have mentioned.

Previous to 1896 there were no Fourdrinier wire weaving plants west of Ohio, the W. S. Tyler Co., being in Cleveland. In this year the Appleton Wire Works was founded at Appleton by William Buchanan, his two sons, and his brother-in-law, A. B. Weissenborn. There are now five Fourdrinier wire weaving shops in Wisconsin, the other four being the Wisconsin Wire Works at Appleton, Fox River Wire Cloth Co., Appleton, International Wire Works, Menasha, and the Green Bay Wire Works, Green Bay.

These several weaving plants were established in the order named.

The changes which have taken place in the paper industry during the life time of men actively engaged in it are almost beyond belief; the changes in width and length of machines, in speed at which they are operated, new materials used for paper making, and the new methods of preparing the paper stock, have revolutionized the industry.

The manufacturers of paper machine wires have not been asleep at the switch, but have steadily perfected their machinery and methods of drawing and weaving wire, endeavoring to keep step with the changes which have taken place in the manufacture of paper.

I have had paper mill superintendents ask me why the Fourdrinier wire manufacturers do not make as good Fourdrinier wires as we did 20 or 30 years ago. My reply has been that we are making better wires today than we did a generation ago, and if the present day wires were run under the same conditions as to speed, stock, etc., as the wires were run at that time, the peresent day wires would give better service and satisfaction than the wires to which they refer.

It is not necessary for me in this company to speak of the great increase in speed at which wires are now run, the increase in suction to get the water out of the sheet more quickly, the wood pulp made from various kinds of wood used for stock, the clay and talc used for filler, etc. These and other changed conditions have made more severe demands on a Fourdrinier wire, which we Fourdrinier wire manufacturers have strained every nerve to meet.

Composition of Wire Metal

Previous to the beginning of this century practically all wires were woven on hand looms operated by two weavers, the shuttle being thrown back and forth by hand. The hand looms have been gradually superseded by power looms that weave wires which are smoother and of more uniform weave than the wires woven on hand looms. Today there is not a Fourdrinier plant of any importance weaving wires on hand looms. These modern power looms are of various types, but are all operated mechanically and controlled by one weaver. Our power loom, invented by our president and manager, A. B. Weissenborn, is operated by compressed air, electrically controlled. Other types of looms are belt driven and operated by a cam.

There are many factors of importance entering into the manufacture of Fourdrinier wires. One of these is the quality of the wire. The two metals used almost exclusively in the manufacture of Fourdrinier wires are low brass and phosphor bronze, although monel metal and nickel alloy have been experimented with for Fourdrinier wires, and while these metals are satisfactory for use in cylinder covers they have not been found satisfactory for Fourdrinier wires. The low brass is termed "Tombac." The composition of this metal is about 80% best lake copper, 20% best horse-head brand of zinc. The composition of phosphor bronze Fourdrinier stock is in the neighborhood of 90% copper, the balance being tin, and phosphorus being added as a cleansing agent and to assist in the amalgamation of the metals.

---

*Read before the Superintendents association at the Papermakers' convention, Appleton, Wis., Oct. 25-27, 1923.

Most of the mills find that wires made of all brass give the best results. Other mills prefer Fourdrinier wires made of phosphor bronze warp and a brass shute as best meeting their conditions, while occasionally a mill prefers wires made of all phosphor bronze, both warp and shute.

The wire is reduced to the proper size for weaving the various meshes by being drawn through diamond dies. These diamond dies are round discs of brass about one inch in diameter, in the center of which is set a small commercial diamond or bortz, through which a small hole is drilled which determines the size of the wire.

The drawing of the wire through the dies hardens it. Therefore it is necessary to anneal the wire before weaving that the paper machine wires may be sufficiently soft and pliable to run on the paper machines without cracking.

There are various methods of annealing wire, by gas, oil, electricity, and charcoal. We have always used charcoal for annealing our wire, as in our judgment the best results are obtained by this method of annealing wire for Fourdrinier wires.

One of the most important features of a wire is the seam. As a chain is no stronger than its weakest link, so a Fourdrinier wire is no better or more serviceable than its seam. As the speed of paper machines has been increased, and various wood pulps and fillers have been increasingly used, the paper mills have demanded a seam that is strong; one which will resist the friction and wear of the suction box covers; a seam which will not fill up, and on which the lightest sheet will form with a minimum of seam mark. Years ago when machines were run at a much slower speed, when rag or rope stock was generally used, and there was but little filler, seam trouble was rarely known; but under present conditions seam trouble is the most frequent source of trouble, and this in spite of the most strenuous efforts of the Fourdrinier wire manufacturers to put seams in their wires which will meet all of the various modern requirements.

In years gone by in the slow running machines with a smaller number of suction boxes, the shake of the machine would prevent the wire from scoring the suction boxes, but as the speed of the paper machines has been increased and additional suction boxes have been added to get the water out

(Continued on page 14)

Coloring of Paper*

Properties of Dyestuffs Used in the Paper Industry—Discussion of Troubles, Their Cause and Remedies

By KENNETH T. KING
Du Pont de Nemours Co.

VARIOUS papers on coloring have been read before this association during the past four years, the subject matter for the most part being of a general nature with respect to the selection and application of various groups of dyestuffs to different grades of paper. Very little attention has been paid in these papers to the use of individual dyestuffs.

The technical department of a dyestuff company can classify its work into three groups; namely:

First, research or development work, together with the practical application of this work in the mill.

Second, matching of shades, using the laboratory as an aid for practical matching in the mill.

Third, helping to correct difficulties with respect to the use of dyestuff in the mills.

In going over the color problems which the various mills have brought to our attention we find a marked similarity in the difficulties encountered. A great many of these differences are due to the incorrect manipulation of certain individual dyestuffs on account of characteristic properties they may have.

Rather than discuss the dyestuff question in general, this paper will be devoted to a discussion of the properties of certain dyestuffs or groups of dyestuffs which are used extensively in the paper industry and which have been the most general causes for trouble.

Handling Basic Colors

Basic colors, as a class, should never be dissolved at a temperature above the boil. If live steam is used in dissolving basic colors, there is a chance that the strength of the dyestuff may be reduced as much as 30%. If, upon allowing the dyestuff solution to stand after boiling by the use of live steam, an oily or tarry mass rises to the surface of the solution, it is proof that a certain disassociation has been produced by the steam.

This trouble can be avoided by dissolving basic dyestuffs in the following manner: Heat the water to a boil, and then sprinkle the dyestuff into this solution with constant stirring. The dyestuff will go into the solution more readily than by shooting live steam into the solution containing the dyestuff, and clotting is avoided in addition to the guarantee that the strength of the dyestuff is not decreased due to the disassociation.

There are three exceptions to the above rule in the dissolving of basic dyestuffs; Auramine, Victoria Blue and Basic Browns should never be dissolved in water over a temperature of 160°F. In fact, in the case of Auramine, the temperature should not exceed 140°F.

Theoretically, approximately 40 parts of water should be used in dissolving one part of basic dyestuff. In practice, the best general rule to follow is never to have less than 80 parts of water per part of dyestuff. In other words, approximately one pound per ten gallons.

In many mills using the basic blues and violets for tinting, the dyestuffs are found to crystalize out of solution along the sides of the tank. This may sometimes be corrected by the addition of acetic acid to the dissolving water before the dyestuff is added, but in case acetic acid will not correct this difficulty, it is a direct sign that the dyestuff is in too concentrated a solution.

---

* *Presented at Superintendents association, Papermakers' convention, Appleton, Wis., Oct. 25-27, 1923.*

Basic dyestuffs should never be allowed to stand in solution for more than 24 hours, because after that length of time hydrolysis takes place to an extent of weakening the solution as high as 20%.

Auramine is hydroscopic in character, and if kept in a very damp place may absorb to as high as 15% of moisture. For this reason, Auramine, more than any other dyestuff, should be kept in storage where atmospheric conditions are normal, these being the conditions under which it is standardized.

Whenever a complaint is made concerning the standardization of Auramine, our first step is to weigh the contents of the keg or barrel, compare this weight to the gross weight marked on the barrel, and it is usually found that where pound for pound the strength of the dyestuff is supposedly reduced, the gross weight of the barrel has increased in practically the same proportion.

Chrysoidines and Basic Browns require alum to develop their shade. Due to the heat of the dryers, a sheet of paper colored with Chrysoidine will appear redder as it comes off the machine than it will be five minutes later. This point must be watched in matching a new shade, so as to not act too quickly in changing a formula in case the paper first run over the machine is a trifle red.

The chief difficulty in using any of the Basic Violets is that the paper colored with them is decidedly redder under artificial light than in a natural light. For this reason it is harder to hold a shade with Methyl Violet during the night than with any other basic dyestuff. If the mill is equipped with a daylight lamp, a good policy is to use the lamp both during the day, as well as at night. Practically no trouble is ever experienced with any of the other basic dyestuffs, provided the general directions for dissolving are followed.

Characteristics of Acid Colors

Acid colors differ from basic colors in the fact that they may be dissolved at a boil. Approximately half the water is required to dissolve them as is required by basic dyestuffs, and they are practically unaffected in shade by the heat of the dryers. More trouble is experienced however, with Metanil Yellow, belonging to this group, than with any other dyestuff used in the paper mills.

Metanil Yellow is very sensitive to excesses of acid or alum, this sensitiveness being accentuated by heat. This dyestuff is the most economical to use for the manufacture of yellow shades of container liner, but unless certain points are closely observed, it is practically impossible to hold a uniform shade on this type of stock.

It is common practice in the board mills to use excess of alum as well as to heat up the liner stock to temperatures ranging from 100° to 110°F., which is good practice, to 180°F., which is very poor practice. In having the temperature of the beater excessively over 110°F., not only is the shade of the board decidedly deadened, but the sizing is also decreased, and the strength of the stock reduced. In other words, if enough alum is used for sizing purposes and the temperature of the beater be kept at the correct degree, no trouble with Metanil Yellow should be experienced, but in case the shade of Metanil Yellow is deadened, the superintendent should look further to see the sizing qualities of his board, for the Metanil Yellow acts as an indicator on this point.

Acid colors are the most satisfactory for calender coloring, but for this type of work the most highly concentrated brands obtainable should be employed for the following reason: Reduced brands of acid dyestuffs are diluted with salt, and the salt solution when impregnated into the surface of the sheet of paper will naturally decrease the sizing qualities.

This point is also applicable to the use of concentrated brands of acid or direct dyestuffs in the beater, for here again the salt used in diluting reduced brands has a deteriorating action on the size. Practically no other trouble is experienced with the acid dyestuffs, with the exception of trouble from two sidedness and foaming.

Foaming may be decreased by the use of slight excesses of alum and by decreasing agitation of the stock to the minimum. If such methods are not satisfactory, the introduction of a small amount of Turkey Red oil or a mixture of linseed oil and ammonia will decrease the foaming. The use of kerosene is to be avoided because it acts as a solvent for free rosin in the size and will appear on the machine by gumming up the press rolls.

Two sidedness is a question too paramount to discuss in a paper of this type. Our research department is working on this problem and within the next few months we hope to have information which will be of decided advantage to all the mills.

In the coating mills acid dyestuffs face the problem of fastness to alkali. This problem resolves into a careful selection of just which dyestuffs should be used for each coating formula.

Direct dyestuffs like acid dyestuffs may be dissolved at a boil, though continued boiling is not good practice. Alum has the property of dulling all direct dyestuffs, which explains the difference in shade obtained on sized and unsized papers.

On mixed furnishes trouble is often experienced due to granite fibers appearing in the sheet. This can be avoided either by adding the dyestuff in very cold dilute solution, or by adding it dry to the beater.

As explained in the use of Chrysoidine, certain direct dyestuffs are much redder in shade due to the action of heat and alum when first they come off the machine than after the paper has assumed atmospheric conditions. Direct dyestuffs that act in this manner are very seldom recommended for use in paper mills, because other direct dyestuffs which do not act this way can be used to obtain the same shades at approximately the same cost.

Heat Losses in Machine Room

(Continued from page 6)

The proper use of the economizer manufactured by J. O. Ross Engineering Corporation and applied under Briner and Alexander patents will effect further savings as follows:

Economizer Design Data From J. O. Ross Engr. Corp.

Item	Name	A Open	B Hooded	C Closed
1	Total air to Economizer No.	3270	1350	675
2	Temp. fresh air to Economizer	30°F	30°F	30°F
3	Temp. fresh air to Economizer	85°F	90°F	90°F
4	Temp. Exh. air from Economizer	87°F	95°F	100°F
5	Total B. T. U. Economizer	216,000	151,000	131,500
6	Total B. T. U. removed from Economizer	43,100	60,700	78,900
7	% Heat recovery	20%	40%	60%
8	B. T. U. required for No. of air	13.2	14.4	14.4
9	No. min. heated air	3270	4220	5480
10	Cu. ft. per pound	13.75	13.86	13.86
11	C F M heated air	43,500	58,500	75,900
12	Equivalent steam recovered No. min	43.1	60.7	78.9
13	Boiler horse power recovered	81	114	148
14	Steam cost per ton paper dried	4.98	3.46	3.02
15	Steam saved per ton paper dried	$ 0.99	$ 1.40	$ 1.81
16	% Steam saving by Economizer over open room	20%	40%	60%
17	Combined saving $ per ton	$ 0.99	$ 1.93	$ 2.78
18	Combined saving closed machine over hood			$ 0.85
19	Combined % saving over open room		38.8%	55.8%
20	Combined % saving closed machine over hood			24.6%

Conclusion

The open machine shows large losses and the closed machine shows decided saving over the hooded machine.

The economizer savings are large and warrant its general adoption.

The combination of the closed dryer and the economizer give the lowest drying cost.

Speeding Up Cornish China Clay

Loading Dock and Electrical Conveyor Established at Frowey to Expedite Shipment of Town's Principal Product

By W. Trethewell
Of St. Austell, Cornwall

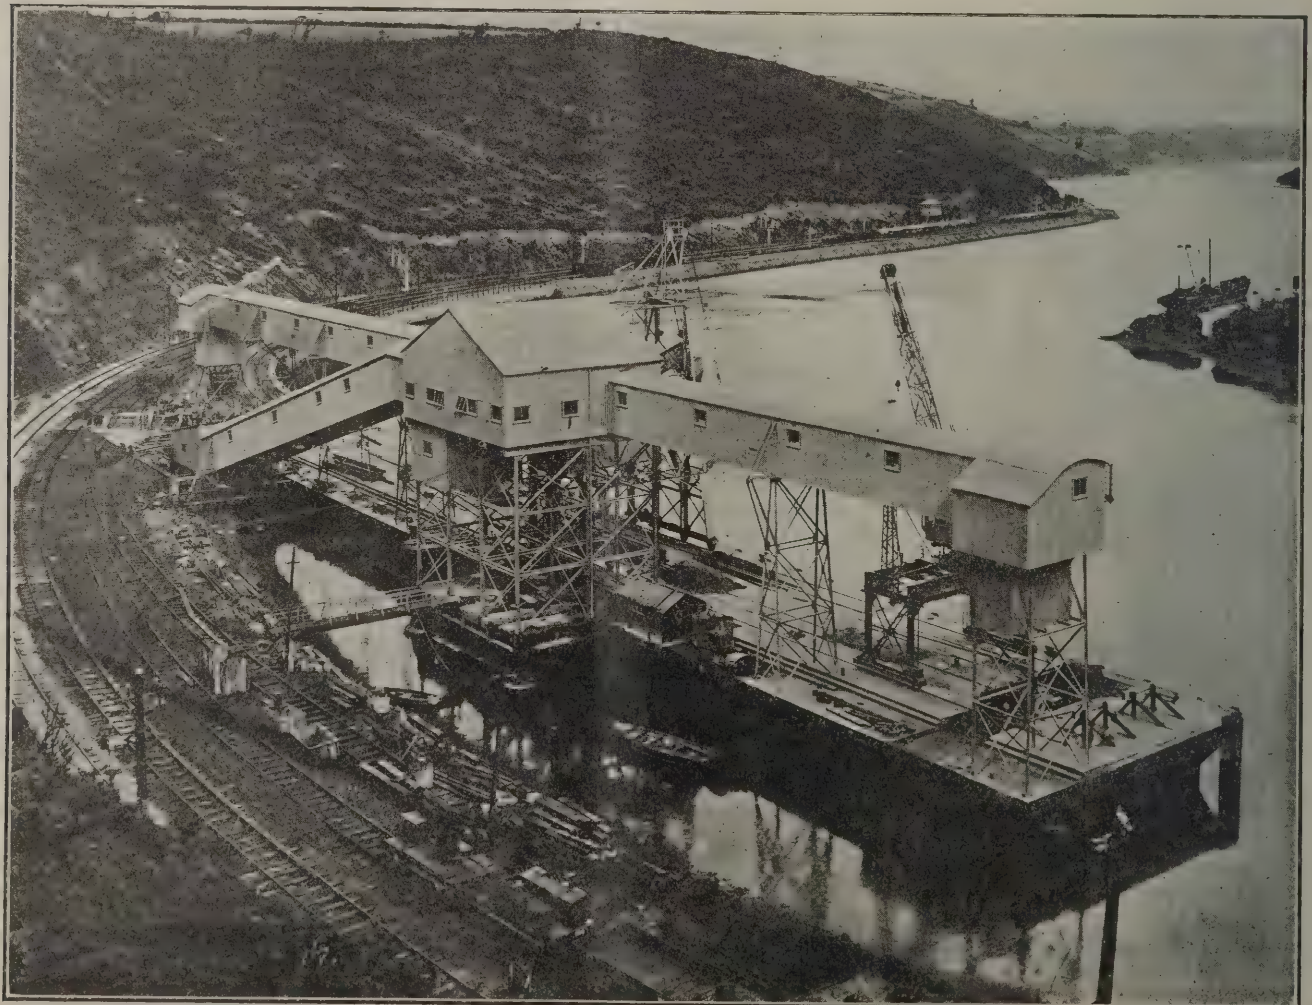
THE opening of a new jetty with its wonderful electrical transporting apparatus at Frowey, Cornwall, England, erected by the Great Western Railway company at a cost of £300,000, marks an important event in the history of the Cornish china industry and it is hoped will open up quite a new and interesting era of prosperity to all connected with the development of this world famous product.

For years the port of Frowey has been the chief exporting centre for the china clay trade and, with the increasing demand of the American markets, producers have frequently been perplexed with the problem of how to avoid delay in the despatch of big boats coming into the harbor. Although Frowey possessed seven jetties, six of them could only be regarded as tipping stages, with a small capacity of between 300 and 400 tons per day each, and the best performance on record is a shipment of 280 tons in three hours. three hours.

It was in the year 1900 that the Great Western Railway company, with characteristic foresight, equipped one of the jetties with an electrical transporter constructed upon the endless band principle, conveying the clay up to a chute connected with an adjustable tube, thence discharging the clay into the hatches of the boats. This mechanical arrangement has been capable of shipping 1000 tons per day and the best performance on record is the transference of 1500 tons in 12 hours.

The number of boats calling at Frowey for china clay for the United States of America, by what is known as the "Direct Line," have been exercising the attention of the authorities controlling the port for some years.

As far back as 1912 the Great Western Railway company decided upon a new jetty with an electrical apparatus far superceding the No. 6, and one which would meet the demands of the industry for several years. The war, however, held up the scheme until 1920 when operations were resumed, and its completion has created the liveliest satisfaction to all concerned in the prosperity of the industry.



Frowey's new jetty and electric conveyor, showing a picturesque portion of the river and haven

The harbor commissioners, with such distinguished leaders as Sir Arthur Quiller-Couch, a native of Frowey and one of England's foremost literateurs, and J. De Cressy Treffry, have been assiduously co-operating with the Great Western Railway in the development of the port by a vigorous dredging scheme, to afford a free egress of vessels of a much larger tonnage and enabling them to load at any state of the tide.

Down to the year 1870 there was very little development in the size of the ships employed in the china clay trade. The average size was 100 tons. In that same year a barque named the Belmont, homeward bound from Rangoon, came in for shelter during a heavy gale. She was 958 tons, and was probably the biggest merchant vessel that had entered Frowey down to that time.

Now the biggest ship that enters the harbor in its regular course is the American steamer "Steadfast" of 7883 tons gross, and 444 feet long. Even during the early part of October the Japanese s. s. "Venice Maru" sailed with the largest consignment on record of 8,208 tons of china clay for Philadelphia, and many large consignments ranging from 5000 tons to 7500 tons are being frequently despatched for American consumption.

It was this increasing trade and tonnage that led the Great Western Railway company to embark upon one of the most ambitious undertakings ever attempted to accelerate the despatch of shipments of china clay, and the consummation not only confers a boon upon the china clay industry, but also emphasises the forward policy of the Great Western Railway, as well as the adroitness of their engineering chiefs. The Great Western Railway company has practically the monopoly in the transmission of the china clay from the works to the port but they have, by their specially constructed branch lines and miles of sidings, co-operated with the producers in bringing the industry to the exalted position it holds to-day.

Every harbor which has a natural resource has been the subject of schemes for the attraction of great ships. This may sound merely obvious, but as Sir Arthur Quiller-

Will America Profit by Canada's Errors?

By **B. T. McBain***

Assistant General Manager, Nekoosa-Edwards Paper co.

News Item: "Three hundred square miles of pulpwood burned in Quebec in October, 1923."

AS trees grow in Canadian forests about as thick as hair grows on a dog's back, the loss of pulpwood in this one fire probably approximated 5 million cords.

This is not the only loss. The supply has not only been diminished but has been put just that much farther away from consumers and has greatly increased delivery cost. Besides, this was not the only fire in Canadian woodland sections in 1923; but only one of the many that are fast devastating the timbered resources of our brother country to the north of us.

American forests have been burned in the past and so have other Canadian districts borne the loss of that demon Fire; but, have they profited by these experiences and losses?

It is of record that the loss by fire in both countries each year amounts to more than the annual cut for pulp and paper mill uses. It is estimated also that at present consumption and fire loss annually, the timber supply with natural growth will not last many more years. This should not be alone of interest to paper mill owners and employes; but to consumers of paper, both large and small and all of us are in some way consumers of paper and paper products.

The press of the country is beginning to wake up and give this question some thought and space; but not one percent of what they must eventually do, to get the matter squarely before the people so they in turn will force their representatives in the various state legislatures and the national congress to give it the time and attention necessary to perpetuate our pulp wood supply.

Canada is waking up; but instead of stopping the flow of waste at the bung hole, is trying to stop that minor drip of waste at the spigot. They are burning up each year, so it has been stated and the evidence is available to bear out these statements, many times as much wood as is being exported to the United States, yet instead of taking heroic means to prevent the loss by fire, they are trying to prevent that smaller loss to Canadian pulp mills' future supply, by tagging up an embargo on exportation.

But, can we find fault with our Canadian brothers? Are we doing enough for ourselves along the lines wa lay down for them to follow? Of course, our timberlands were no older than Canadian lands; but we did start cutting them for pulp purposes many years sooner than cutting was commenced in Canada and we should have been practising forestry ever since the cutting began.

Forestry is not alone the planting of trees any more than farming is only the planting of seed. Farming is more the protection and care of the growing crop and proper preparation of the soil than it is the planting of seed. So it is with forestry, except that a crop calls for a season of 40 years rather than one. Forestry first is the protection of the natural planting and forest protection starts with means for fire prevention before fire fighting.

Canada did not profit by America's foolish experience of the past and did not arrange for proper fire prevention and protection. Will America now profit by Canada's foolish experience and devastating fire losses of the past month? Will the people of the various states of America sit idly by and allow their legislatures and the national congress to pass up this greatest of national calamaties which stares us all in the face—a wood famine? Yes, they will sit idly by, gentlemen of the pulp and paper industry and other wood using industries, unless you take immediate steps to apprise them of the facts through word of mouth, educational work in the schools, in the clubs, granges, farmers' unions and other unions, to the end that the people know the truth and order correction.

The pulp and paper manufacturers of Wisconsin are showing signs of activity. Let us hope they will not be like the volcano that boils up to the surface of the crater and then subsides into obscurity; but will be real means of starting the fires of public opinion to the desired end.

Fire prevention, fire protection and forestry and finally, a perpetual supply of pulp wood for the north American continent.

---

* *Paper read before Wisconsin Fire Protective Association.*

Annual Strathmore Dance

The eighteenth annual president's dinner and dance of the Strathmore Paper company, in honor of Horace A. Moses, was given by the department heads of the company Nov. 3 at the Hotel Kimball, Springfield, Mass. Dinner was served to the officers and ladies at 6:15 and was preceded by a brief reception. President Moses was toastmaster and brief toasts were responded to by the department heads. Dancing followed until midnight.

Elaborate decorations in honor of the occasion prevailed. Favors consisted of cigars and candy and were distributed with a lavish hand. The dancers wore colored headgear made of paper while ribbon confetti and fancy balloons were used effectively.

The committee in charge consisted of Paul Griswold, chairman, assisted by Miss Gertrude Neipp, Miss Helen Downs, Miss Doris Osha, James Speed, Godfrey Porter, Fred May, Charles Higgins, Harold Bolles and George Wholean.

The guests of honor were Rev. Dr. and Mrs. Fred Winslow Adams, Mr. and Mrs. D. S. Barrus, Mrs. Lillian D. Breuninghausen, Rev. Glenn W. Douglass, Mr. and Mrs. George H. Harris, Mrs. and Mrs. E. V. Johnson, Mr. and Mrs. J. Leavenworth, Mr. and Mrs. Charles W. Moses, Miss Madeline Moses, Mr. and Mrs. Edward W. Pillsbury, Miss Mary Reid, Mr. and Mrs. Harry Riggs, Mr. and Mrs. Kenneth Robbie and Bradley Stafford.

Water Conditions in Wisconsin

Paper mills in the Wisconsin river valley are experiencing a handicap caused by the low water conditions While this condition is not extremely serious and no unusual difficulties are looked for it is a fact that curtailment of production in some departments of these mills may be looked for.

There have not been the usual heavy fall rains this year, there being only a few slight rains and these had little result.

The network of reservoirs in Northern Wisconsin where water is normally stored to maintain the river level during the winter season, which are operated by the Wisconsin Valley Improvement company, are at a lower level than they were at this time last year and unless heavy rains occur between now and the final freeze they will continue to lower.

It will, no doubt, be necessary for many mills to shut down grinders, thus curtailing groundwork production. Some have already had to do this. It is expected there will be enough water for most mills to run their electrical equipment although there are a great many who have the necessary steam auxiliaries to meet this condition and some of these have already been brought into play.

Paper Merchants Elect Officers

The annual meeting of the New England Paper Merchants' association was held Thursday, Nov. 8, at the Boston City club, when Arthur W. Blackman of D. F. Munroe Co., Boston, was elected president, succeeding Joseph D. Snell. Other officers elected are: first vice president, Hubert L. Carter, of Carter, Rice & Co., Corporation, Boston; second vice president, Charles A. Esty, C. A. Esty, Paper Co., Worcester, Mass.; treasurer, Albert M. Eaton, A. M. Eaton Paper Co., Boston; secretary, Floyd H. Blackman, D. F. Munroe Co., Boston; auditor, H. P. Robinson Co., Portland, Me.; executive committee, fine papers, Arthur E. Ham, A. E. Ham & Son, Boston and Royden Loring, Arnold Roberts Company, Boston; wrapping papers, Frank H. Merrill, Andrews Paper Company, Boston and Matthew O. Byrne of the Whitney Brothers Incorporated, Boston. Representative to National Paper Trade association, W. F. McQuillen of A. Storrs & Bement company, Boston and F. Bendel Tracy of the Fort Hill Paper company, Boston.

The election of officers followed the dinner. No other business was transacted.

Stream Pollution and Waste Problems

Problems of stream pollution and the wood waste problem on the Pacific coast have been discussed at two informal conferences in the offices of the American Paper and Pulp association.

William A. Gately of the Department of Commerce is working on the Pacific coast question, and asked the assistance of the association in securing information relative to the use of west coast woods for pulp. He has been on the coast for more than two months for Secretary Hoover, studying waste in the lumber industry, and has asked the help of the Woodlands section and the Technical association in further studies along this line, particularly with regard to the use of the wood waste from the lumber industry for paper making.

The discussion of stream pollution was with William Spraragen, secretary of the division of engineering of the National Research Council. Dr. Baker told Mr. Spraragen that the paper industry needs large quantities of good clean water and is in favor of proper methods for preventing stream pollution. Before legislation is enacted, however, it was pointed out there should be a scientific knowledge of what constitutes stream pollution and how it may be properly prevented. With such information, and not otherwise, should it be possible to take legislative steps toward solution of the question.

New Mill on Vancouver Island

Henry W. Kent, of Portland, Oregon, and B. A. Strawbridge of Seattle, Washington, officials of two investment companies, have announced plans for the cutting of from 800,000,000 to 1,000,000,000 feet of timber on Vancouver island, opposite the west coast of British Columbia, and the building of a new pulp and sulphite mill at Edmonds.

Portland interests own the timber on twenty-seven sections adjacent to Quatsino Sound, according to Mr. Brown. The investment companies propose to bond the timber, utilizing the money to build a mill at Quatsino Sound which will export the squared lumber to a finishing plant at Edmonds. Options have been procured on eleven acres at Edmonds.

A pulp and paper mill to use the waste from the Edmonds plant and from other lumber mills on Puget sound is also under consideration by these investment companies.

British Columbia has lost in her fight to curb the exportation of partly dressed logs from her vast forests, is announced by T. D. Pattullo, provincial minister of lands. Southern California has absorbed a large portion of the logs exported. A "joker" in the tariff schedules on lumber made it possible to ship this class of logs out of the country without much trouble. Mr. Pattullo said that British Columbia had gone "to the limit of our powers under dominion law."

Improvements are being made to the plant of M. Backes Sons, Inc. of Wallingford, Conn., manufacturers of paper novelties. An addition costing $20,000 is under construction.

Fighting Foreign Dumping

Abuses of the tariff act as it applies to the paper industry will be followed closely by the American Paper and Pulp association as a result of the paper import conference held at the Waldorf Astoria hotel Thursday, Nov. 15. Several hours of discussion by some of the best known leaders in the industry were followed by a request to the American Paper and Pulp association to take steps to curb the abuses which are becoming so frequent as to constitute a serious menace to the domestic industry.

President Henry W. Stokes of the association, who presided at the import conference announced after the meeting that the executive committee of the association would be asked to meet at the earliest date possible to carry out the wish of the conference. What steps will be taken can of course not be told at this time, as this will depend entirely upon the action of the committee.

The conference was one of the most important meetings of the year, and was marked by statements from various groups in the industry indicating the extent to which foreign paper is coming into the American market in contravention of the spirit of the tariff act.

In opening the conference President Stokes said that the meeting was called because of the damage being done to the American industry by foreign importations, and was followed by Dr. Hugh P. Baker, executive secretary of the association, who reviewed the work already done to combat the dumping and improper entry of foreign papers.

O. M. Porter, assistant secretary followed with an explanation of the procedure under the anti-dumping statute, and other provisions of the tariff act, and Warren B. Bullock, director of the association's Information Service gave figures showing the increase in sales of foreign paper.

John Matthews, Jr., of Washington, chief of the paper division of the Bureau of Foreign and Domestic Commerce told of the difficulties experienced by government representatives in getting information about foreign imports.

Representatives of the various groups affected were then asked to tell of the difficulties they were experiencing. How high grade tissue was being entered as wrapping paper under a low duty and then sold as tissue was told by the tissue paper men. In greaseproof and similar food protective papers it was told that these special papers were being entered as wrapping, and as in the case of tissue marketed as the high quality paper at prices which domestic manufacturers could not meet.

Newsprint and papers for publication were not discussed, the chief evil complained of being in imports from Germany and Scandinavia.

Wrapping paper, however, came in for extensive discussion, because of the manner in which imports have been suspected of coming under the dumping act, or undervaluation. It was pointed out that the quantity of the imports was not particularly large, but that the bankrupt sale prices at which paper from Germany, for instance,was offered had a bad psychological effect on the entire American market.

The sentiment expressed throughout the conference was the need for curbing the abuses becoming increasingly prevalent, and there is no doubt that the association will take steps to combat every effort of European shippers to evade the tariff act.

After an absence of a year and a half, owing to ill health, William J. Robertson has again joined the executive staff of the Heller & Merz company as assistant to the treasurer, Eugene Merz. Mr. Robertson has fully recovered and will devote his attention to the buying and selling end of the business, making his headquarters at the New York office, 503 Hudson street.

Resignations from A. W. P. Co.

Fred H. Sturtevant, a widely known figure in the paper industry, has resigned his position as general superintendant of the fine mills of the American Writing Paper Company of Holyoke, Massachusetts, with which company he has been associated since its organization in 1899.

When interviewed as to his future plans. Mr. Sturtevant stated that after 41½ years in the paper industry he thought a rest was indicated before taking up anything further.

Entering the old Massasoit Paper company at the age of 18, Mr. Sturtevant learned the paper business thoroughly in the respective departments of billings, receiving, and shipping and was on the road as a salesman for ten years.

When the American Paper company was organized in 1899 he was made manager of the Springdale Paper company division; in 1900 he was made manager of the Windsor Division and in 1903 he went to the Parsons division as manager, later being made manager of three other important divisions.

In January, 1915, Mr. Sturtevant was made general superintendent of the whole of the fine mills of the American Writing Paper company, which position he has held up to the time of his retirement.

C. Leslie Barnum, office manager of the American Writing Paper Company of Holyoke, Massachusetts since May, 1923, has resigned his position.

Mr. Barnum, who has been with the company for sometime was head of the department of Technical Service during the Gallivar regime and took up the office managership when the former department was discontinued.

Barnum made a name for himself during the war when he served as under secretary on the Hoover commission.

New Mill at Plattsburgh

H. P. G. Norstrand, who resigned as manager of the Stevens and Thompson mill in Greenwich a few months ago to take part in the organization of a new pulp and paper company in Plattsburgh, has been elected president and general manager of the new concern, which is incorporated under the name of the Saranac Pulp and Paper company. H. H. Guibord is vice president of the company and John W. Guibord is treasurer.

The new company is converting the plant formerly occupied by the Lozier company into a modern paper mill. The former boat building plant is to be occupied by the pulp mill and the main building which was used by the Lozier concern for the manufacture of automobiles, is being converted into a paper mill. It is expected that the pulp mill will be ready for operation in the spring and the paper mill will be completed in the early summer. The plant is located in the north end of the city of Plattsburgh.

The company is also developing a hydro-electric power on the Saranac river five and a half miles from Plattsburgh. This plant will have a capacity of 3,600 horse power and will furnish energy for the operation of the new paper and pulp mills.

The Western Forestry and Conservation association will meet at Seattle, Washington, December 13 and 14. Representatives from California, Oregon, Montana, Idaho, Washington and British Columbia will attend the conference. Subjects which will engage the attention of the conference will be reforestation, fire prevention, expense of holding timber lands, length of hunting seasons (these increase the danger to forests from fire) and other matters pertaining to forestry.

Activities of Association Officers

Busy times in the offices of the American Paper and Pulp association have followed the fifth fall business conference in Chicago and other meetings in the middle west, attended by different members of the association's executive staff.

Dr. Hugh P. Baker, executive secretary of the association, after the Chicago conference visited paper mills in Minnesota, addressed faculty members of the University of Minnesota interested in forestry problems on the need for cooperation between industry and the forestry schools for the better handling of the country's forest resources, and then went to Wausau for the conference which resulted in the formation of the Wisconsin Forest Protective association. On the return from Wisconsin he attented the annual convention at Chicago of the American Trade Association Executives, where he spoke on standardization in industry. On the trip back east he stopped at Lockport, N. Y., to visit mills in that region, and was a speaker at the Lockport Rotary club.

While Dr. Baker was in the west, O. M. Porter, assistant secretary of the association, attended the joint convention at Appleton of the Technical, Cost and Superintendents associations, and spoke before the convention on the need for intensive study of the raw material problem.

Immediately upon the return of Dr. Baker from the west, Henry W. Stokes, president of the association came to New York to plan the associations's program for the next six months until the April annual meeting in New York.

Mr. Stokes was asked to attend a conference of business men representing trade associations at which Mr. Hoover took up the question of trade with Japan, but was represented by D. A. Smith of the District of Columbia Manufacturing company.

Enlarging Manning Paper Mill

Construction of an addition to the John A. Manning Paper company's plant in Green Island, N. Y., that will increase its output fifty per cent has been started. The new addition will be 350 feet long and 45 feet wide. It will be of two story brick construction.

Ten years ago the Manning company purchased the plant that was used by the Gilbert car works, finding it necessary to move from Troy, because of the removal of the state dam and the need of constructing a large barge canal terminal where their former building had stood.

Officers for Indianapolis Companies

Meetings were held in Indianapolis October 11 of the Beveridge Paper company, the Toledo Paper Stock company and the National Paper Stock company for the purpose of electing officers for each of these companies.

The following were elected for each company: Samuel B. Sutphin, president and treasurer; Stuart B. Sutphin, vice president; Marshall D. Lupton, secretary.

Swedish Pulp and Paper Prices Decline

The average domestic prices of various kinds of paper in Sweden at present show a decrease all along the line, compared with those reported September 17, writes Consul D. I. Murphy from Stockholm, under date of October 5, to the Department of Commerce.

Present prices on kraft and M.G. sulphite are as follows: Kraft, 40 grams and up, 380 crowns (1 crown equals $0.26); 35 to 39 grams, 400 crowns; 30-34 grams, 430 crowns; 25 to 29 grams, 460 crowns; 20 to 24 grams, 500 crowns; 18 to 19 grams, 540 crowns; and 17 grams, 580 crowns.

Prices on M.G. sulphite were: 40 grams and up, 340 crowns; 35 to 39 crowns, 360 crowns; 30 to 34 grams, 390 crowns; 25 to 29 grams, 420 crowns; 20 to 24 grams, 460 crowns; 18 to 19 grams, 500 crowns; and 17 grams, 540 crowns.

Domestic prices of the various kinds of Swedish wood pulp have also decreased, the present prices being: Bleached sulphite pulp, 300 to 325 crowns; easy bleaching sulphite, 245 to 255 crowns; strong sulphite, 225 to 240 crowns; strong sulphate, 225 to 235 crowns; and wet mechanical pulp, 70 to 75 crowns.

E. E. Keough has returned from an extended business trip to the Pacific coast in the interest of the American Writing Paper company and will continue his work as manager of the advertising department of that company, working in close conjunction with the newly created department of sales promotion, which is in charge of Fred Webster.

The Story of Fourdrinier Wires

(Continued from page 8)

of the sheet rapidly, the wire has a tendency to hang or freeze to the last one or two suction boxes, which scores the suction box covers, and this scoring in turn gouges and cuts away the seam, causing the seam to break out before the full life is obtained from the wire.

Much thought has been given the matter of overcoming this scoring of the seams. One method has been to weave paper-machine wires slightly sinuous so that the wire will have a slight serpentine motion when running on the machine. This is to prevent the wire from tracking and scoring the suction box covers.

Another method of overcoming this trouble is to equip the paper machines with oscillating suction boxes to achieve the same result of preventing scoring as the weaving of the sinuous wires accomplishes.

All wire manufacturers have more or less seam trouble, and one of the mysteries of our industry is why several wires, one after the other, will give good satisfaction and service and the seam not break out, while the next wire run, made of the same stock, woven in the same manner, and the seam so far as we know exactly the same, will be gouged and worn away so that the seam will break out before the wire has given its full life.

Another factor of importance is the proper stretching and packing of Fourdrinier wires. The stretching rolls and beams must be large and strong that there may be no spring, and that the wires may be stretched square and flat and so run true on the machine and guide properly.

As the paper machine wires have become larger and heavier the packing of them has become a greater problem, requiring larger and stronger rolls and heavier boxes. If these heavier boxes receive rough handling or are dropped on end from freight cars or trucks, as is sometimes done, the liability of damage to the wire is vastly increased.

If the men who put on wires and who handle them in the mill could see how they are made and realize the care the wire manufacturers exercise in weaving, seaming, stretching, and boxing them, it would no doubt make them more careful to see that the wires get on the machines in good condition and free from all breaks, kinks, dents, and creases, etc., which of course tend to shorten the life of a wire on the machine.

It is always a pleasure to show visitors through our plant, that they may see how wires are made, and I extend a cordial invitation to any and all of you to visit the Appleton wire Works and see how "Good Wires" are made for, as you probably know, "Appleton Wires are Good Wires". I am sure that John Watson, manager of the Wisconsin Wire Work would also be pleased to have you visit his place.

Construction News

Winchester, Va.—The Shenandoah Boxboard Corporation, recently organized at Coshocton, Ohio, has acquired the local plant of the Old Dominion Paper Co. Plans are under way for extensions and improvements in the existing works, including remodeling and the installation of additional equipment. It is proposed to use the plant for the manufacture of cartons and kindred products. Nathan H. Carpenter is president of the new company.

Brooklyn, N. Y.—E. J. Trum, Inc., 55 Third street, manufacturer of paper boxes, containers, etc., is having plans prepared for the construction of a new three-story plant, 100x150 ft., at 764-66 Fourth avenue, Brooklyn, estimated to cost approximately $120,000, including equipment. William Higginson, 15 Park Row, New York, is architect.

Kalamazoo, Mich.—The Valley Paper Co., Press building, has plans in preparation for the construction of a new paper mill on local site, with main operating unit and auxiliary structures, estimated to cost close to $500,000, including machinery. The project calls for the erection of a power house, machine shop and water filtration plant. Billingham & Cobb, Press building, are architects and engineers.

Circleville, Ohio—The Hinde Paper Box Co., has tentative plans under consideration for the construction of a new local plant for the manufacture of fiber boxes and containers. It will be 80x350 ft., estimated to cost approximately $60.000. Equipment will be electrically-operated.

Trainer, Pa.—The Congoleum Co., with plant at Trainer, near Chester, has acquired a tract of land in the vicinity of its works, comprising about 20 acres of property, for a consideration said to be $50,000. The new owner is reported to be planning for the erection of a paper mill on the site, to cost in excess of $100,000, with machinery.

Philadelphia, Pa.—The Philadelphia Paper Mfg. Co., River road and Fountain street, has awarded a general contract to the Hughes-Foulkrod Co., 1312 Chestnut street, for extensions and improvements in its plant, to cost close to $10,000.

Halifax, N. S.—The Albany Perforated Wrapping Paper Co., operating as the A. P. W. Paper Co., has acquired a tract of about 60,000 acres of pulp and timberland property in the vicinity of Sheet Harbor, near Halifax, and has tentative plans for the construction of a new pulp mill to cost approximately $250,000, with machinery. A machine shop and electric power substation will be built. Arrangements have been made with the Nova Scotia Power Commission, it is stated, for service from the central generating plant of this organization. The initial plant will be equipped for an output of about 25,000 cords of pulp wood per month, giving employment to close to 300 operatives. It is expected to have the plant ready for service early in the spring. The property acquired heretofore has been held by the Sheet Harbor Lumber Co., formerly Rhodes & Curry.

San Francisco, Cal.—Col. Daniel C. Jackling, Hobart building, is said to be at the head of a project to construct and operate a large paper mill in the vicinity of Juneau, Alaska. The proposed mill is reported to be estimated to cost in excess of $1,500,000, with machinery, and will consist of a number of operating units.

Boonton, N. J.—The Powerville Paper Mill has negotiations under way for the sale of its hydroelectric power plant and water rights on the Rockaway river, to the city, for a consideration of $60,000. The municipality purposes to use the station for a municipal plant.

Boston, Mass.—Lyle A. Brown has leased space in the building at C and Fargo streets, South Boston, for the establishment of a new plant for the manufacture of paper products.

Philadelphia, Pa.—Fire, Nov. 3, destroyed a portion of the four-story building of the Hemingway Paper Co., 238-47 Elbow Lane, near Third and Market streets. The amount of estimated loss has not been announced. Tentative plans are under advisement for rebuilding.

North Tonawanda, N. Y.—The corner stone of the new mill on Little Island, to be erected by the Daily News Paper Corporation, a subsidiary of the Ontario Paper Co., Thorold, Ont., was laid with appropriate ceremonies on Oct. 30, and superstructure work will be pushed to completion, with expectation of having the plant ready for service early in the coming year. Carl F. Drewes, mayor of the city, officiated at the event.

New Companies

Newark, N. J.—The Union Waxed & Tissue Paper Co., Inc., has been incorporated with a capital of 6,000 shares of stock, no par value, to manufacture special paper products. The incorporators are R. Flaster and Rae W. Shapiro. The company is represented by Bilder & Bilder, 790 Broad street, Newark.

Chicago, Ill.—The William W. Noble Label & Box Co., 448 North Wells street, has been incorporated with a capital of $35,000, to manufacture paper boxes, labels, and kindred products. The incorporators are William M. Noble, M. Zahl and John M. Bryant.

Paterson, N. J.—The McCrystal-Greene Co., Inc., has been incorporated with a capital of $50,000, to manufacture and deal in paper products. The incorporators are Frank H. Greene, Martin De Luccia and Joseph McCrystal, 74 First street, Paterson. The last noted is representative.

Herkimer, N. Y.—The Waterproof Paper Products, Inc., has filed notice of increase in capital from $50,000 to $100,000, for expansion.

Plant Operations

The Eddy Paper Co., Three Rivers, Mich., is maintaining active operations at its mills and is establishing new records for reduction in cost of production. At its Mill No. 3, the second highest monthly average output was obtained in August, this being 9,350,499 pounds of material; this same month also established a record for the year's lowest average cost of converting waste paper into the finished product, being $18.17 per ton, as compared with a high cost figure obtained in June of $27.74 per ton. The previous low cost record was derived in April, with the figure standing at $19.17 per ton. This mill is the largest unit of the company plants, and includes the box and container departments.

Paper box manufacturers at Philadelphia, Pa., are advancing production and report increased orders, particularly for containers, standard and special, for holiday service. A number of plants are adding to their working forces and expect to hold to the present schedule of output for an indefinite period. Sales are said to be considerably ahead of those at this time a year ago.

Paper mills in the Fox river valley section of Wisconsin expect to increase operations in the near future, and despite the usual dull seasonal period from which the industry is now emerging, there has been an uninterrupted shipment of pulpwood to the plants. No mill hereabouts, incidentally, has been forced to close down, or to reduce its working force to any noticeable extent. The plants have been handicapped recently through a water shortage, necessitating the use of auxiliary steam power for operation.

Buck, Caier & Co., Inc., importers of pulp, have removed their New York City office from 342 Madison avenue to 9 East Fortysixth street.

New Developments in Paper Making

Moisture Indicator

In order to determine and record the humidity of paper at any given point between the wet end of the forming mechanism and the calender rolls, wet and dry bulbs mechanisms are placed against the web. These testing and recording devices may be moved continuously over the surface of the web to test it at numerous points so that it is possible to obtain a mean estimate of a moisture content. In connection with the testers devices may be provided for regulating the temperature in accordance with the records given. This apparatus is patented in British patent No. 192,401.

* * *

Making Cardboard

German patent No. 381,145 is concerned with a process and apparatus for the manufacture of cardboard from different stocks with the help of the cylinder machine. The machine serves to combine the different layers of stock into one homogeneous sheet. The new feature of this process is that the different layers of paper stuff, after being formed on either one or the other of the cylinder screens, is then transferred to a single forming roll, one layer after the other being carried over to that roll and combined into a single sheet.

* * *

Distilling Waste Sulphite Liquors

Swedish patent No. 50,740 is concerned with a screen of distilling waste sulphite cellulose liquors. The process is characterized by the fact that a part of the distilled vapor, after being heated, is returned to the mass of liquor in the still so as to maintain the temperature at the distillation point. The heat recovered from the steam that does not take part in this cycle, is used either for heating or drying purposes. The organic acids that are distilled over along with the steam are absorbed by making the latter pass through a bath of milk of lime or other similar and suitable absorbents.

* * *

Cotton Cellulose

A process for the manufacture of cotton cellulose is patented in Swedish patent No. 53,422.

The process of making a cellulose which is an imitation of cotton cellulose consists in treating ordinary sulphite cellulose in a special manner so as to render it more pliable. In this form it is advantageous to use it for rag stock in making special printing papers and the like. The process consists in subjecting the sulphite cellulose to a digestion with a solution of alkali while agitating it constantly. Pressure may or may not be employed in the digester in which the operation is carried out.

* * *

Paper With Hand Made Finish

United States patent No. 1,470,675 which is assigned to the American Writing Paper Co., is concerned with a process of manufacturing paper which has a finish that makes it resemble handmade paper.

The papermaking machine that is used for this purpose comprises a pulp vat, a rotating cylinder which is covered with a screen with imperforated strips spaced at regular intervals over it and protecting out from the surface of the screen for indenting the web of pulp formed on it in divisional lines. T machine also contains a series of pairs of press rolls, top a bottom felts engaging opposite sides of the web as it pass successively through the press rolls.

There are also breaker rolls for receiving the web after passes through the press rolls. These breaker rolls act fri tionally to pull the paper web apart into individual shee along the indented lines that are impressed as described abov

The paper then passes over one or more drying cylinde which are provided with top and bottom felts for receiving t divided sheets of pulp from the breaker rolls, after which t paper passes through a sizing bath.

* * *

Pulp Digestion Process

The process which is patented in German patent N 380,497 is concerned with the manufacture of pulp digestion under pressure and with indirect steam heatin so as to save heat.

The indirect method of digestion has often been appli by conducting superheated or saturated steam through coi located in the digester, the steam yielding its heat to t liquor. The economy of such an apparatus lies mainly the fact that the steam gives up the greater part of i heat in passing through the coils, so that a measurement the economy is afforded by noting the difference in ter perature between the incoming and outgoing steam or co densate.

In this heating process there are in reality two stage one in which the liquor is brought to the boiling point a the other in which the boiling of the same is actual carried out. In ordinary apparatus the first stage of t process has always been carried out with efficiency whi this has not been the case in the latter stage.

This is accomplished by arranging a number of stea coils in the digester which are fed with the steam that evaporated during the first stage of the heating proces This recovers the heat in the steam and enhances t economy of the entire heating process.

* * *

Waterproofing Paper

Waterproofing of paper is effected by precipitating, by mea of alum, within the beater in the usual manner, a size co sisting of an emulsion of a bitumen, fat, wax, or mineral o in a solution of rosin soap to which has been added a protecti colloid such as glue, gelatin, starch and the like, and also condensing agent or polymerizing such as formaldehyde, tann acid, chromic acid, etc. These latter substances are capab of polymerizing the rosin, partially oxidizing the mineral wa and hardening the fibers.

For example, to a size containing sodium resinate at a ten perature of 70 degrees C, there is added one third of a pi of paraffin wax which has a melting point of from 40 to 5 degrees C. The mixture is then emulsified, eight to ten percen (calculated on the weight of the rosin) of a 40 percent solutio of formaldehyde is added and the mixture is agitated until attains the desired properties. Gelatin (one to two percen calculated on the water present) may be added for the purpos of retarding the subsequent precipitation with alum.

The resulting size is added to the beater and the paper pul is maintained at a temperature of from 45 to 50 degrees until the couch roll is reached. This sizing composition patented in German patent No. 202,432.

Forestry in the Paper Industry

Conducted by J. R. Simmons, Secretary Forester,
The New York State Forestry Association

Is The Profession Over Crowded?

The first forestry school established in this country was the Biltmore school in South Carolina in 1898, and the second was the Cornell school in the same year. The Biltmore school is no longer in operation. At Cornell the forestry department is now a part of the New York State College of Agriculture and is strongly organized. The Yale Forest school came into being in 1900. Then followed in the next eight years the organization of forestry schools all over the United States. In 1911 the New York State College of Forestry was established at Syracuse, and this school has now become the largest institution of its kind. There are at the present time about thirty schools teaching forestry in the United States and Canada, in which approximately 1500 students are registered.

On the basis of a five year course leading to degree of Master of Forestry, the annual output of the forestry schools is approximately 300 men—a low figure as compared with the engineering profession, the medical profession, the law, or any of the well established professions in this country. The statement is occasionally made that the forestry profession is over-crowded. This is probably due to the fact that a large number of applications are received annually by certain favored industries and because many of the foresters attempt to remain in the east where a large proportion of them have trained, rather than to seek their first few years' experience in the western field.

The more the question is studied the clearer becomes the conclusion that over-crowding is purely local and transitory. We do not know of very many foresters of ability who are out of a job; and of those who have taken the full course and entered the field we know of practically none who are not busily and productively employed. Of course, there are a few mis-fits in every line of effort and it requires an all round type of man to make a good forester.

Filibert Roth, head of the Michigan school, speaking to a group of foresters in New York in 1920, said that if a policy should be adopted requiring the application of forestry principles to all timberland holdings it would be utterly impossible to find foresters enough in the country to handle the situation. He stated that a forester qualified to hold a highly responsible position should have in addition to his technical course about ten years of practical field experience. It is quite obvious that the forest industries would encounter difficulty in finding foresters with such qualifications at the present time and in case of an emergency. It will be recalled that France. in spite of her many decades of practical forestry practice made very excellent and timely use of the little band of American foresters who went over with the American Expeditionary Forces; also that those forestry battalions took a large portion of all our trained foresters out of the coutnry including the chief U. S. foresters.

The most recent statement on the subject of supply and demand in the profession is by Gurth A. Whipple of the New York State College of Forestry. Writing in State Service he says:

"Next to reforestation, utilization is the important problem in forestry. It exists in every logging job, every sawmill, every lumber yard, every dry kiln, every wood-working industry and every papermill. The forestry problem involves one-third of the land area of the country. The lumber and wood-working industries in the United States represent an investment of twelve billion dollars and five million persons are dependent on them for support. Next to agriculture, forestry, lumber, and the wood-working industries most vitally influence our national life. There are more than thirty thousand mills in the United States making lumber, lath and shingles. There are three hundred fifty pulp and paper mills in the United States and Canada. This tremendous industry would seem to afford ample room for the absorption of all the foresters the colleges are turning out. The demand is at present greater than the supply."

Will Aid New Mexico

An agreement whereby timber on lands belonging to New Mexico, and lying within or near the national forests, will be handled according to the rules and regulations for handling timber on national forests has been made between the United States Department of Agriculture and the state commissioner of lands. Approximately 215,000 acres of land, estimated to contain 550,000,000 board feet of timber, are involved.

The state of New Mexico has no organization equipped to administer the use of timber on state owned lands so that continuous timber production may be assured, and in recent years the forest service has informally aided the state in handling sales. Under the agreement recently signed and approved the Federal government will now lend full cooperation to the state in handling the timber on its lands.

A similar agreement with the state of Arizona was entered into in 1914 and is still in full force and effect. Under its provisions forest officers of the Department of Agriculture have supervised the cutting of many millions of feet of timber from state owned lands within the Coconino and Tusayan national forests.

The agreement with Arizona and the new agreement with New Mexico both provide that the salaries and expenses of federal officers while engaged on state work shall be paid by the state concerned.

Consulting Forestry Service

A consulting forestry service for paper and pulp mills has been announced by the Woodlands section of the American Paper and Pulp association, in line with its object "to encourage the practice of forestry on the timberland holdings of the pulp and paper industry."

Returns on the timberland holdings of the paper industry can be assured only where these lands are adequately protected from fire and so logged as to provide for a second cut or a reasonable resale value. It is to meet this situation that the Woodland section is offering the consulting service to members of the American Paper and Pulp association, along the lines of timberland examination and formulation of management, fire prevention and reforestation plans.

The proper handling of timberlands, says the Woodlands section announcement, can be assured only by the service of trained and practical foresters. Many companies have not realized the necessity of employing a forester in the management of their timberland holdings; others own insufficient lands to warrant the employment of a full-time forester; and others may be contemplating the purchase of timberlands or actual management operations on those lands which they already own. It is for such companies that the new service is being offered.

The charges for the service will be nominal, as the Woodlands section would expect to be reimbursed for actual travelling expenses only, with a reasonable fee for the services of O. M. Porter, the section's secretary, himself a technically trained forester.

Fire Season About Ended

No more big fires are expected to break out in the eastern, western and northern national forests during the rest of the 1923 fire season, according to the United States Department of Agriculture. However, in the southern national forests the autumn fire season is just beginning and the menace of serious fires in those regions still confronts forest officers.

Recent snows and rains helped to control the fires which were being fought in October in many of the northern forests. Fires in several California forests have also been brought under control and no further outbreaks are expected.

Taken as a whole the 1923 fire season has been comparatively favorable on most of the national forests, although destructive fires occurred in Minnesota and southern California. Fires burned large areas outside national forests in California, the outstanding fire having been the one that caused such great damage to Berkeley, California.

In commenting on the decreased number of fires thus far this year compared with previous years, Chief Forester William B. Greeley stated:

"Fires on national forests thus far for 1923 have been fewer in number and much less destructive than for several years. Weather conditions have been more favorable than usual and, further,I believe the public has become aware to a greater extent than ever before of the terrible menace of man-caused forest fires and has been more careful with fire while enjoying the recreational advantages of wooded areas.

"It is still too early to make any definite statement on the number and extent of 1923 fires as the fire season is not yet ended in the southern national forests, but I think I am safe in predicting that the 1923 season will show a record most gratifying to the public as well as to those whose duty it is to protect the national forests."

How Forest Fires Are Caused

The following is a statement on the causes of forest fires based on figures for an average year, by the Forest Service and the National Board of Fire Underwriters.

1. Railroad locomotives are the chief offenders; they cause fully one-seventh of all forest fires. In New Hampshire, during 1920, nearly 75 per cent of the forest fires were due to this cause.

2. The careless burning of brush and trash by farmers and others, causes nearly as many fires as do the railroads. Such fires are most prevalent in the southeast and in the Mississippi Valley.

3. Incendiarism ranks third; it causes more than one-eight of all forest fires and is most prevalent in the southeast and in the Mississippi valley where the stockmen, in particular, deliberately set fire to the woods to improve grazing conditions.

4. Campers, including all pleasure seekers in the woods, hold fourth place, causing nearly one-eight of the forest fires. The principal offenders are careless smokers, particularly those using the so-called "tailor-made" cigarette.

5. Lumbering stands fifth as a fire hazard and is charged with causing one-sixteenth of the timberland fires, although in the states where lumbering is one of the chief industries it is found to be a major fire cause.

6. Miscellaneous causes such as steam rollers, tractors, blasting, burning buildings, Indians and children are also responsible for about one-sixteenth of all forest fires.

7. About one-fourth of the timberland fires are due to unknown causes. Nearly all such fires, however are believed to be caused by some human agency.

8. Lightning is held to cause about one-eleventh of all forest fires. During 1920, nearly 89 per cent of such fires occurred west of the Great Plains where rainless thunderstorms are not infrequent.

Making Idle Acres Work

Announcement has just been made that the New Haven Water company, which has had 10,000 acres of land under forest management for many years, has for the last fifteen years been able to log this land at an average rate of 310,000 board feet annually, besides 2,700 cords of fuel wood, and the planting has cost only about one cent per tree.

Another announcement of importance comes out of New York to the effect that the New York state barge canal is preparing to reforest 2000 acres of barren land, the work to be done cooperatively by the canal officials and the New York State College of Forestry. Landscaping of the area will be considered as well as the production of a heavy stand of timber to prevent erosion.

The paper and pulp industry would do well to study the efforts of the industrial and municipal groups when making plans for perpetual supplies by way of the reforestation route. It often happens that when a large enterprise in reforestation route. It often happens that when a large enterprise in reforestation is undertaken, whether by a municipality or by a business corporation, great enthusiasm develops among the people at large in the locality; and, provided the area to be planted is not too far from the centers of population, labor and trees can be provided for at a surprisingly low figure. The psychology of the enterprise appears to be somewhat like this—if the state supplies planting stock free, or at cost of production, it must be for the reason that the whole people will benefit from the building of forests, (a logical basis of reasoning) and the industry that is progressive enough to undertake reforestation and set the idle acres to work deserves every assistance and encouragement.

Forest Products Association Meeting

At the annual meeting of the Empire State Forest Products association at Utica, New York., Nov. 8th, a feature of the program was an open forum on "Forest Policy for the State of New York." This was led by Franklyn Moon, dean of the New York State College of Forestry, Ralph S. Hosmer, professor of forestry at Cornell University, and Hon. Henry M. Sage, president of the New York State Forestry association.

Resolutions adopted during the evening session, and too late for insertion in this issue of PAPER, will appear in these columns next week.

The Maryland Board of Forestry will provide winter lectures on forestry to school and various organizations all over the state. The lectures will be given by the forester and his three deputies.

PAPER

A Weekly Technical Journal for Paper and Pulp Mills

Published and owned by
Hughes Publishing Co., Inc., George C. Hughes, President
Published Weekly at East Stroudsburg, Pa.

Executive and Editorial Offices:
1478 Broadway—Suite 418, New York

SUBSCRIPTION RATES
(Strictly in advance)

United States and Insular Possessions ....$5.00 a year
Canada and Foreign Countries ....$6.00 a year
SINGLE COPIES, 25 CENTS
An advance in price is required for back numbers, depending on scarcity

Entered at East Stroudsburg, Pa., Post Office, as Second-Class Matter

Vol. XXXIII November 22, 1923 No. 5

Vicious Foreign Competition

As this issue of PAPER goes to press a meeting is being held at the call of President Stokes of the American Paper and Pulp association to discuss the subject of the heavy importations of foreign paper at prices based on lower foreign labor costs.

The formal call for this meeting contains the following interesting statement:

"The competition from foreign papers is becoming increasingly difficult to meet and repeatedly during the past two months we have had calls from manufacturers of several different grades of paper for assistance. We need now a very full discussion of the whole problem and we need your special help in solving it."

Among the subjects suggested for discussion at this meeting are the refusal of the customs authorities to give relief under the anti dumping statute, the bringing in of various types of paper under improper classification, under valuation and similar subjects.

That the matter covered by this conference is a most serious one cannot be doubted by anyone who has even a cursory knowledge of recent conditions in the paper market. The kraft and wrapping paper manufacturers have been the principal victims but manufacturers in other lines have not entirely escaped.

The United States is not alone in suffering from the flood of foreign paper products which has been flowing from the continent of Europe. Conditions are fully as bad, if not worse, in England. For several months the trade publications of England have been complaining of the effect upon the paper manufacturers of that country. Editorial comment in the World's Paper Trade Review for November 2 includes the following gloomy view of the situation:

"The wrapping and coarse paper section of the papermaking industry is in a bad way and the outlook has no bright spot in it. As we observed last week, some merchants are unloading stocks of sulphite and kraft at clearance prices. Importers are offering heavy stocks at figures with which our mills cannot hope to compete. Even the Scandinavian mills, whose present conditions are more favourable than our own, find themselves up against an impossibility when facing continental quotations. The question of quality plays a very small part in current wrapping paper trading and loyalty to, or even an indication of sympathy for, the home mills is entirely lacking. Even the merchants whose feelings formerly prompted them to push British paper find it impossible to take it in open competition under the conditions that prevail. Short of a tariff, it is difficult to see how the situation can be changed. If we wait for it to resume its ordinary aspect by the slow process of natural restoration of normal relationship, there will be no British wrapping section left worth speaking of."

American Industry Is Standardizing

That practically every American industry is making some effort toward standardization as a means of eliminating waste is shown in a study of the general subject made for the American Trade Association Executives by Dr. Hugh P. Baker, executive Secretary of the American Paper and Pulp association.

No less than sixty-six associations representing basic industries gave Dr. Baker data as to the extent of standardization in those industries in replies to his questionnaire, which embraced seven questions. Practically all of the associations report some steps toward standardization. Thirty-five associations have committees at work on the subject, and 75 per cent of the sixty-six associations have standardized or simplified their products at least in part. The paving brick manufacturers, for instance, have reduced the number of varieties from sixty-six to six, and the Portland Cement association has achieved a single standard of specifications. The Refractories association has reduced 100 varieties to 25. The milk dealers have gone a long ways forward in standardizing sanitary fittings in milk, ice cream and butter factories. The metal lath manufacturers have reduced 150 styles and finishes to 10 weights with comparatively few finishes.

A wide variety of answers was received to the question "To what extent do you consider it advisable to carry standardization?" "Until business is lost because essentials are not supplied," is a typical answer. The question of originality of design appears in this phase of the question, and again in the replies to the query as to possible harmful results. Seventy-five percent of the replies see no harmful results possible. At least half of the associations are cooperating with government agencies to this end and the last question, as to whether standardization should come through private or governmental efforts was almost unanimously answered in favor of private initiative.

"The accomplishment of waste prevention and of thrift must come," says Dr. Baker in his summary, "as the result of organized effort and this organized effort in industry means the effort of the trade association."

Short Ends from the Paper Field

The Milwaukee Lace Paper Co., Milwaukee, Wis., has leased the third floor in the building at 9-11 West Broadway, New York, for local headquarters.

The Bureau of Foreign and Domestic Commerce,, Washington, D. C., has received an inquiry from a company at Stockholm, Sweden, desiring to purchase American reinforced waterproof papers and waterproof boxes. (References 8016 and 8017.)

President S. L. Willson of the American Writing Paper company of Holyoke, Mass., denies a story which has been prevalent to the effect that the company had disposed of a part of its holdings located in a city outside of Holyoke. He declared that the company had disposed of none of its holdings.

As the result of death of the son of Michael J. Carty of Pittsfield, in an accident in which a truck of the Smith Paper company of Lee, Mass., figured, Mr. Carty was awarded a verdict of $4500 from the paper company. Counsel for the paper company have filed a motion for a new trial in the case claiming the verdict was against the weight of evidence. The jury awarded a verdict of $3500 for liability and $1000 for conscious suffering.

The Eaton, Crane & Pike company of Pittsfield, Mass., recently purchased the plant formerly occupied by the Pittsfield Machine & Tool company. Machinery in the building has been sold to the Simmons Machine Tool Corporation of Albany, N. Y., and the paper company is now making improvements in the plant and installing machinery for its own work. The first floor of the building will be used for refinishing and plating paper and the second floor will be used as a printing shop.

At a recent banquet given two Linn county, Oregon, Commercial clubs at Mother's Inn, Tangent, Oregon, James O'Hara, superintendent of the Crown Williamette Paper company's Lebanon paper mill, said that his plant, which is one of several operated by the company, is now making the strongest wrapping paper with the exception of one paper mill, that is manufactured in the United States.

A Swiss paper mill in Zurich recently purchased fifteen tons of German marks for the purpose of converting the paper into pulp. The customs authorities however, refused entrance of the shipment under the law prohibiting the importation of large sums of "foreign currency."

The Stenno Carbon Paper Manufacturing company, of Portland, Oregon, employs thirty traveling salesmen. C. K. Bland, who has been with the company for five years, is sales manager of this force. This company is rapidly increasing its sales. Many of the new orders are coming from China and Japan.

The Gulf Paper Co., of Mobile, Ala., has increased its capital stock from $12,000 to $25,000.

Sheldon E. Wardwell, representing the St. Croix Paper company and a resident of Brookline, Mass., says that it employs from 500 to 2,000 men and owns 176,000 acres of timberland in New Brunswick. The company operates its own timberlands and last year spent $546,000 in Canada besides paying freight rates amounting to $100,000 additional. He opposed the embargo.

W. B. Wentworth, Old Town, Me., of the Chemical Fibre Co., said his company purchased about 8,000 cords a year in New Brunswick, that it had a contract to purchase 25,000 cords in the next five years and an obligation in stumpage of $50,000 to be paid. Since 1915 the company had spent $1,100,000 in the province for wood, $500,000 or more in labor and $250,000 in freight.

The Pratt Paper company of 159 Devonshire street, Boston, Mass., has succeeded to the business of the Denison Pratt Paper Company of the same address.

P. H. Graham & Son Co., of Boston, have purchased a building at 104-126 Ward street, Boston, adjacent to the New Haven and Boston & Albany railroads as a warehouse. The company's warehouse on East Dedham street was recently damaged by fire. They will occupy the new building in about a week.

Excavations have been started for the foundation for a warehouse for the Judd Paper company, 116 Race street, Holyoke, Mass., from plans prepared by P. B. Alderman & Co., of Holyoke. The building will be of brick, three stories and basement, mill construction, 90x100 feet, and will cost approximately $75,000. The general contract has been awarded the Casper Ranger Construction Co.

The Union Bag & Paper Corp., Woolworth Bldg., New York City, will erect a bag factory in Bogalusa, La., to cost about $500,000.

The Nashville Paper Stock Co., Second Avenue and church street, Nashville, Tenn., has let the contract for erection of a $40,000 building. D. L. Ledbetter is secretary.

The National Paper Stock Co., Nashville, Tenn., will erect a four-story brick building on the corner of First avenue and Church street.

Charles E. Vautrain of the American Writing Paper Company of Holyoke, Massachusetts has been appointed the first president of the newly organized Publicity Club of Holyoke, which will be run by the local Chamber of Commerce. Mr. Vautrain in returning thanks to the members for his nomination said that the club plans to bring men of nation wide advertising reputation to the Paper City with a view to benefiting local advertising men.

The Portland Label company, in its plant at Milwaukie, Oregon, a town near Portland, employs girls for the shaping, moulding, and coloring of the tiny and delicate boxes which carry pills and capsules all over the world. This branch of the paper industry is said to be so delicate that no machinery has yet been invented to do the work for which girls are employed. The plant at Milwaukie is the only one of its kind west of Chicago. It is growing rapidly. Recently movie pictures of the girls at their work of pill box making were shown in several of the theaters of Portland.

Speeding Up Cornish China Clay

(Continued from page 11)

Couch remarked to Sir Herbert Russell, another great writer, on one occasion, "the policy of the harbor commissioners at Frowey was to develop to the full limits of their natural capacity." It must be gratifying to all admirers of this attractive little Cornish harbor that works of such magnitude have been carried out without inflicting the slightest ruffle on the amenities of the residents or the town's innumerable visitors. The clay enters the town almost unnoticed and the shipping is all done higher up the haven, that the great charm of Frowey as a harbor is that its prosperity leaves its natural glories undisturbed.

The new jetty was opened on Thursday, September 27th, in the presence of a large company of distinguished railway officials, harbor commissioners, china clay producers, the mayor, aldermen and councillors of Frowey Borough council. The Associated China Clays Ltd. was represented by T. Medland Stocker, J. P.; J. W. Higman, J. P.; and J. S. Lovering, managing directors; Reginald Martin, Vice Chairman; W. Sessions, H. Stocker, J. Lovering, J. P.; F. Lovering, F. Parkyn, J. Perry, S. J. Dyer, J. Hooper, H. Nicholls, A. Courtenay, D. G. Collins, E. J. Hancock, J. Hoyle, W. Rose, J. P.; W. E. S. Taylor, S. Benson, secretary and manager.

Situated just above the No. 7 jetty there is a depth of 18 feet of water at low tide. The new jetty is 500 feet long from shore to end, about 300 feet straight and 50 feet wide and capable of accommodating two vessels simultaneously; is of steel work and masonry super-structure, on steel cylinders sunk into solid rock. The conveyor is electrically operated from the existing generating station which has been enlarged and in which additional machinery has been installed.

The operation of working is as interesting as it is expeditious. Trucks are taken on to a table and electrically tipped and the clay is deposited into a chamber or silo, from which an endless band conveys it to an elevated platform where the clay is transferred to a horizontal band working to a portable tower and thence through a chute nto the hold of the ship.

This portable tower traverses the greater part of the whole length of the jetty, and can be moved from hatchway to hatchway to avoid vessels having to be shifted when once they are moored to the jetty. Time lost in moving ship to bring hatchway under chute is thus obviated and loading expedited. The chute can be regulated according to height of vessel out of the water and it can be raised to sufficient height to clear any ship's side when ight and on top of the tide. At the end of the chute is an adjustable trimming nose to enable the discharge of clay into the hold to be made over a wider area and thus save a great deal of hand trimming.

The rate of travel of the inclined belt is about 125 feet per minute; the horizontal belt is rather faster, to avoid a possible congestion of clay at the point of transfer. The rate of loading is from 200 to 240 tons per hour.

The silo has a double steel casing with concrete filling, this being provided on account of a portion of the silo being several feet below the water level. The silo is also constructed on steel cylinders sunk into the solid rock.

A movable three ton electric crane is installed to enable cask or bag clay to be loaded simultaneously with the loading of the bulk clay by conveyor, the trucks being passed underneath the legs of the crane as required. The working of the trucks is done by electric capstans and reels in lieu of the old system of horse shunting.

Additional land has been purchased contiguous to the jetties and the sidings increased so as to hold several hundred loaded trucks of clay to make the feeding of conveyor as continuous as possible. Any ship capable of being dealt with in the harbor can be handled at this jetty at all tides.

Graphical Control of Gases

(Continued from page 4)

determination of the oxygen content of the gas by means of an Orsat apparatus. The value for the oxygen content of the gas which is found in this manner need naturally not be reduced, as we are concerned in this case with an entirely different method. However, if this value and the uncorrected value of the sulphur dioxide content of the burner gases are used in the gas diagram, then incorrect determinations will be found for the most part of the excess of air required for combustion of the sulphur.

It may be mentioned that there are also line diagrams which allow the reduction of the gaseous volume to standard conditions both from the standpoint of pressure as well as temperature. This can be done when the barometric pressure is known. However, as it often happens that a barometer is not available, the line diagrams which have been discussed above are sufficient for all general purposes in the paper mill which burns sulphur.

Clarke Mill to Resume

The paper mill at Bear River, N. S., founded by Clarke Brothers and which, owing to financial tangles has not been operated for the past year, will resume operations before Christmas, judging from present indications.

For some time past efforts have been made to reopen the mill, and following some periods of uncertainty, arrangements have been made that will result in the resumption of operations. United States capital has been instrumental in perfecting arrangements. Holders of first mortgage bonds of the original company have agreed to accept an offer from representatives of United States capital.

The organization of the new company will continue, the board of directors to consist of three representatives of the bond holders of the original company, three representatives of the purchasers, and another man who is not to be connected with either of these factions. A first mortgage bond issue of $140,000 has been floated, the proceeds to furnish enough capital to make repairs and place the mill in good condition.

Under the agreement between the bond holders and the purchasing interests, the first mortgage bond holders are to receive second mortgage refunding of the new company. In addition each of the bond holders is to receive a fifty dollar share in the new company in seven per cent cumulative preferred stock for each bond. The bonds are to bear seven per cent interest, with maturity in twenty years. New York, Chicago, Dayton, and Milwaukee capital have been interested in the proposal to re-establish the Bear River mill.

For many years the Clarke Brothers maintained, in addition to the paper mill, a corrugated paper and paper box factory in St. John, N. B., and another in Bear River and three saw mills in the Bear River section of the Bay of Fundy. They also operated a steamer service between Bear River and St. John.

Progress in Reforestation

George Carruthers, head of the Interlake Tissue Mills at Merritton, Ont., has returned to Toronto after a trip through Simcoe country and reports the gratifying movement of reforestation in progress in that Ontario district.

With an ultimate aim of planting 100 acres in trees annually, 600,000 yearling seedlings are now being transferred from tree nurseries while thirty acres of the Simcoe county are is being planted in three-year-old seedlings.

Mr. Carruthers has been campaigning against the needless waste of trees at the Christmas season and points out that many of the trees sacrificed from the farmer's wood lot for Christmas festivity might be retained and replanted to beautify the farm house surroundings.

Labor Shortage Will Reduce Wood Cut

Indications now are that less pulpwood will be cut in eastern Canada during the Winter season of 1923-1924, than expected. This is attributed to the increased wages demanded by the workers in the woods operations.

It was predicted during the early Fall that more pulpwood would be cut during the current season than for any previous Winter season. However, owing to an exodus of men to New England and western Canada, the operators found a dearth of available men, the scarcity being much greater than in any previous year, even during some of the war years.

In the province of New Brunswick, $60 per month and board are being offered for men to cut pulpwood. And according to some of the operators it would be no surprise to them if the price ascended. Last Winter plenty of men were available at $40 per month and board. It is thought that the scarcity would not have been as keenly felt but for the efforts made during the past few weeks of labor agents to secure men for railrod construction work. A large number of men, who would ordinarily go into the woods, have gone to work on the railroad construction.

More Embargo Testimony

That the matter of an embargo on exports of Canadian pulpwood is not the most important question before the Royal Commission investigating the pulp and paper industry, was the statement made by Elwood Wilson, chief forester of the Laurentide Paper Company, Quebec, at an Ottawa sitting of the commission. He believed that forest management, with conservation, was the most important pending question.

The statement of the Canadian Pulp and Paper association on the present condition of the industry, as laid before the commission by the secretary Edward Beck, was made the subject of a series of questions by Aime Geoffrion, K. C., of Montreal, who is appearing before the commission in the interests of United State manufacturers. Mr. Beck had stated that at the present time his association did not favor an embargo on pulp exports, to which Mr. Geoffrion retorted that the association was in favor of an export embargo on what is bought, but not on what it was in business to sell.

Timber Area Leases

The Ontario government has recently disposed of a number of timber areas. Among them are two burned-over areas, one situated in the township of Rennie and the other in the township of Sheddon. The Rennie limit was acquired by Austin & Nicholson, of Chapleau, Ont., who will pay $1. a cord for spruce pulp, while Graham & Wilkinson, of Spanish Station secured the Sheddon limit at $1.05 for spruce pulp.

Eighteen square miles of timber area in Bond township, located in the vicinity of the T. & N. O. and Transcontinental railway, was disposed of by the Department of Lands and Forests to the Hawk Lumber company, of Monteith, Ont. The company will pay fifteen cents plus eighty cents for spruce pulpwood and ninety cents, plus forty cents for other pulpwood.

Reports are current that control of the Belge Canadian Paper company is now vested in Canadian and United States capital. The majority ownership in this company was previously in the hands of Belgian capital, by whom it was founded. Hubert Biermans, president of the Belge Canadian Paper Company, went to Europe recently, and it is undestood his mission was to effect the transfer in control. United States capital has invested heavily in this organization, through the Canadian stock and bond issues.

Canadian Briefs

Arrangements have been made by the engineer branch of the forestry department of the Abitibi Power & Paper Co., Iroquois Falls, Ont., for the use of a seaplane during the coming season. The plane will be used principally for photography and reconnoissance work over the timber limits of the company. For the next few weeks the use of the plane will also demonstrate pretty thoroughly whether it is of practical value in pulp operations under northern conditions.

The woods department of the Abitibi Power & Paper Co. has begun operations in three districts around Iroquois Falls. Eighteen camps have already been arranged for. Three will be camps conducted by the company, the others being those of contractors. The cut in the camps will be 150,000 cords while an additional 50,000 cords will be purchased from settlers.

D. McLeod, resident vice-president of the Backus-Brooks Co., Kenora, Ont., reports that the new paper mill which is being erected by the company will be in operation in January next. The building is being constructed to take care of two machines although only one is being installed at the present time and the width of the machine is 234 inches. The 80-ton groundwood pulp mill of the company has been in operation for some months.

R. D. Jago, M. Sc. F., who is a graduate of the University of New Brunswick Forest School, has been appointed regional forester in charge of the Saguenay river district by Price Bros. of Quebec. Mr. Jago has been engaged with the forest service in New Brunswick and will shortly assume his new duties.

An unusual case came up in the appellate court in Toronto recently when the appeal of Fred Little from the judgment at the trial awarding him $1,612.26 for pulpwood supplied under contract to the St. Maurice Lumber Co. was dismissed with costs. The unusual feature is that before judgment was given at the trial the defendants had agreed to settle the case for $2,000. and costs.

A large timber limit and lumber transaction affecting a local company was executed in Quebec recently when the holdings of Messrs. W. and H. Kennedy, known as the Lake St. Joseph limits, including sawmills, property, etc., were sold to the Laurentide Co., Limited. The limits consist of about 350 square miles, comprising almost all the land surrounding Lake St. Joseph, which has not already been sold for summer residences. Fifty miles of the limits are fee simple land, the balance under government lease.

The Backus-Brooks Co. expect to have the first unit of their newsprint mill at Kenora, Ont. in operation very soon. This will produce a 236 inch roll and will probably be the largest machine in existence. It is being built by the dominion Engineering Co. It is the intention to build a sulphite mill soon after the paper plant is producing. At present the mill has a capacity of 80 tons of groundwood pulp, which is sufficient for the 100 tons of newsprint that will be turned out by the machine. Sulphite will be shipped in until this mill is completed.

American pulp and paper interests are contemplating a further development of the pulp and paper plant at Hartville, N. S., the intention being, if present plans materialize, to produce between 4,000 and 5,000 tons of newsprint a year, a market for which could be obtained both in the Maritime provinces and in the eastern states.

Favors Embargo on Pulpwood

Canadian P. & P. Association Urges It as Means of Forcing U. S. Concessions

The sittings of the Canadian Pulp Wood Commission held at Ottawa have been by far the most important so far. A great deal of evidence for and against the proposed embargo of pulp wood cut on privately owned lands was taken. The opponents greatly predominated though, at the same time, the lengthy statement made on behalf of the Canadian Pulp and Paper association in favor of the embargo must be considered as representing the majority portion of that industry, since it claims to represent 80 per cent of the mills. Secretary Beck of the Pulp and Paper association read the statement.

It began with the contention that, through the wholesale destruction of wood the forest wealth of Canada was being so rapidly depleted that a crisis in this department was not far distant. It was then held that: "The rate of depletion cannot effectively be reduced by an action that can economically be taken by the lessees of the Canadian pulpwood lands, or even by the private owners who possess in fee simple some small portion of the total amount of these lands. From this it follows without further argument, that the stop of depletion must originate in government action, by the provincial or federal authorities or by both. This does not necessarily mean that the whole management of the conservation process must be entrusted to government officials or to politicians."

Touching on the estimated stand of merchantable soft timber of every kind in Canada, the publication "The Forests of Canada," prepared by the Department of the Interior, was then quoted and the argument proceeded: "In this document the total stand of merchantable timber of every kind of soft wood is given as 871,720,000 cords for the whole of Canada. But of this amount only 65 per cent, or less than two-thirds, consists of good pulp wood namely, balsam and spruce, the great bulk of the remainder being jack pine, which at present is utilized to a very limited extent. This gives us a total of about 580,000,000 cords of merchandisable spruce and balsam in the whole of Canada." Attention was then called to the fact that 80,000,000 cards of this was inaccessible, leaving the total available at 500,000,000 cords.

Respecting consumption and destruction of wood it was remarked that the annual cut of pulpwood had not hitherto greatly exceeded 4,000,000 cords, but that with the present rate of consumption in Canada and of export to the United States a cut of 5,000,000 cords should henceforth be considered the minimum as long as the timber lands held out.

The growth of the pulp and paper industry, the capital investment in which has increased from $186,000,000 in 1917 to approximately $400,000,000 in 1922, had greatly increased the demand for pulp wood. In 1908 the annual consumption by mills in Canada was 500,000 cords, while 900,000 cords were exported. In 1922 the home consumption had reached 2,900,000 cords, while the exports were a little over 1,000,000 cords.

During the first eight months of the current year exports of pulp wood to the United States were 1,046,000 cords, or as much as they were for the whole of 1922. The growth in the home consumption was made strikingly apparent by the fact that in 1913 the newsprint production was 350,000 tons; last year it was 1,086,000 tons. During the last fourteen years the average annual increase in the consumption of pulp wood by the Canadian mills was 15.4 per cent, and it was estimated that if this rate of increase were maintained the home consumption at the end of the next fifteen years would be a little over 16,000,000 cords a year.

It was admitted that the proposed embargo "would cause for a time a sharp reduction in the Canadian cut, for the Canadian mills would be unable to absorb immediately so large an amount of additional wood as one and one-half million cords a year. It is generally conceded, however, that another consequence would be that American concerns, now more or less dependent on Canada for their pulpwood and who control forest areas here either under license or in fee, in addition to being forced into making greater use of their American resources would immediately proceed to build pulp mills in Canada in order to grind their wood here and export it in the form of pulp."

After referring to the expansion of the pulp and paper industry that has followed the placing by the provinces of embargos on the export of pulp wood cut on Crown lands, the conclusion was drawn: "Similar restrictions placed upon wood cut from private lands, it is logical to suppose, would stimulate still further the development of the industry and thereby prove of the utmost economical advantage to Canada. To the extent that this industrial expansion resulted in increased consumption of pulp wood, such a measure could perhaps not properly be classed as assisting conservation, but it would take a considerable number of years of even the most rapid expansion conceivable to overtake the inroads at present being made into our supplies by the system of unrestricted exportation now permitted."

"Timber can be cut and exported from Canada with practically no capital investment whatever except the original price of the limit; but the timber exported from Canada would, if kept in Canada until manufactured and then exported, bring about (and amply remunerate) a capital investment in this country amounting to $150,000,000. It is sufficient to keep 33 pulp and paper mills, each producing 100 tons a day, in operation throughout the year and to give employment to 8,250 operatives earning $11,140,500 in wages. If these mills could all be erected in a single municipality they, and the subsidiary trades and industries which would be needed in connection with them, would alone constitute a city larger than any in Canada except Montreal, Toronto, Winnipeg and Vancouver." It was further claimed that every man thus brought to Canada would be an increased factor working gor conservation, since the new American interests would thus be as much interested as Canadians in this work.

Two possible alternatives were discussed. One the placing of an export tax in place of an absolute prohibition. "This," it was claimed, "if made high enough would reduce, if it did not completely abolish, the drain on Canadian forests by American pulp mills, and insofar as exportation still continued, the resultant revenue could be spent on conservation. It is open to the objection that an export trade however undesirable, which has once become a source of revenue to the government is likely thereafter to be encouraged rather than repressed; while the revenue could under no circumstances be great enough to provide an adequate conservation fund."

The second alternative, which is very important to the American pulp and paper industry(is as follows:

"The second alternative is the use of the embargo proposals in negotiations for a further tariff concession by the United States, in the shape of a free admission of papers other than newsprint into the United States, such as book, writing, wrapping, tissues, kraft, and blotting papers. These now bear a duty of 25 per cent and upwards, and are nearly all affected by the same condition (shortage of raw materials) as led to the removal of the newsprint duty; so that the placing of them on the free list would not be contrary to any general American interest. It would lead to a sharp increase in the amount of capital invested in paper manufacturing in Canada, with the same result in the shape of an increased interest in conservation; and it would possibly effect the removal to Canada of some mills now using Canadian pulpwood and thus cut down our unmanufactured export. This history of the Canadian newsprint industry since 1910 shows that free access to the United State for the manufactured product is all that is required to bring about a very large transfer of the manufacturing industry to this country, especially when combined with a prohibition of unmanufactured export from Crown lands."

Shortage of Woodsmen

George B. Nicholson, ex.-M. P. for Algoma and head of the Austin-Nicholson Lumber company, Chaplau, Ont., large dealers in lumber and pulpwood, was in Toronto a few days ago in search of men for the company's camps.

He reports a shortage of labor in the district north of Georgian Bay where as high as $50 a month and board is being paid. If men care to work piece work, he says, as high as $100 a month can be earned. He reports that from five to eight thousand men are required in the lumber and pulp camps at the present time.

Mr. Nicholson's company took out 10,000 cords of pulpwood last year and will this season take out 15,000 cords for the Spanish River Pulp and Paper Mills, Limited, at Sault Ste. Marie, Ont.

John F. Ellis, the venerable honorary president of the Canadian Paper Trade association and head of Barber & Ellis, envelope and stationer manufacturers, Toronto, celebrated his78th birthday last week and received the congratulations of many friends. Mr. Ellis is a member of the Canadian Manufacturers association, the Toronto Board of Trade and still takes an active interest in their activities, while he is still vigorous in the personal oversight of his own big business.

Control of the Bay Sulphite company, which was formerly in the hands of Sir Frederick Becker, of England, has been taken over by Canadian capital. Becker and Canpany of England, paper manufacturers separating mills in England, went recently into receivership on application of one of the London banks. Sir Frederick Becker was one of the guiding spirits of the defunct organization. He is now in eastern Canada inspecting his various pulp and paper holdings.

Lawson Paper Products, Limited, is the name of a new London, Ont., company, which has been granted an Ontario charter empowering them to do business as manufacturers and distributors of paper. The authorized capital is $250,000 and the provisional directors are J. C. Elliot, R. G. Ivey and J. G. Gillanders.

Paper and Board

New York, November 20—The International Paper Company has fixed a price of $75 per ton f.o.b. mills for standard newsprint to be delivered under contract during the first half of 1924. This price is unchanged from that which has been in force during this year, and means that there will be no change in newsprint prices over the first part of next year because if the leading producer continues its basis the same as has prevailed all of 1923 other companies will obviously quote a similar price.

The I. P. announcement sets at rest all of the speculation regarding an advance in print paper prices. Many in the trade had fully expected a rise of at least a quarter of a cent per pound on standard newsprint would be put into effect as a result of the big demand for print paper and the increased cost of production, but manufacturers apparently are very desirous of maintaining the stability of the market and therefore are hesitant to make any move in the direction of price changing that might upset the firmness that now prevails.

The I. P. Company last spring announced an increase in wages of its mil operatives but in spit of this the price of newsprint is to be left unaltered. President Dodge of the company at that time stated that the company hoped to offset the increased wages by larger production and increased efficiency and that the I. P. would continue to sell its output at the lowest price possible. There is no question that the company has materially increased its production since then, which probably has offset the higher cost of manufacture occasioned by the advance in wages.

The paper market continues in an irregular state. Demand for some kinds of paper is exceedingly active and prices of such grades are firm and tending to stiffen; in other grades an easy condition exists with demand insufficient to give mills enough work to warrant anything like full production. No broad changes in quotations have occurred during the week. Some prices have slid off slightly further, notably on box board, but it cannot be said that demand has diminished to any great extent in the recent past.

The board market is deplorably weak. This is due first to the fact that consumption of board is not large enough to keep mills busy, and there is consequently keen competition among manufacturers to secure business even at price concessions, and second to a sharp decline in raw material, which has enabled manufacturers to reduce prices on their product and still have the same margin of profit as before when prices were higher but when waste paper cost almost double current prices.

Plain chip board is freely offered in New York at $45 a ton f.o.b. this city, and in some cases mills have quoted the same price on news board though in most instances slightly higher is quoted on the latter description of box board, between $47.50 and $50 a ton f.o.b. New York. Demand for boards has not developed in the volume manufacturers had a right to expect for about this time of the year. Evidently pre-holiday business in paper boxes has not measured up to normal this season and board consumption therefore has been comparatively light. Moreover, mills are working on the theory that they must operate at maximum capacity to realize a fair return of profit, and they are leaving nothing undone in an effort to secure as large a part of the business available as they can get. This in itself makes for uneasiness in price as manufacturers are conceding something to buyers to corral their orders.

CURRENT MARKETS—Continued

Book papers are moderately active. The movement into consuming channels is steady but manufacturers are competing with each other for business, and prices are none too firm. Machine finished book is quoted at around 6.50 cents per pound f.o.b. New York for an average grade, while coated book is quoted at 8 cents upward, depending on quality and tonnage.

Fine papers are holding their own in price and are marked by fair demand. Coarse papers are still suffering from foreign competition, and quotations are quite irregular and uncertain. Tissues are moderately active and holding steady at a basis of about 90 cents per ream for No. 1 white tissue f.o.b. New York.

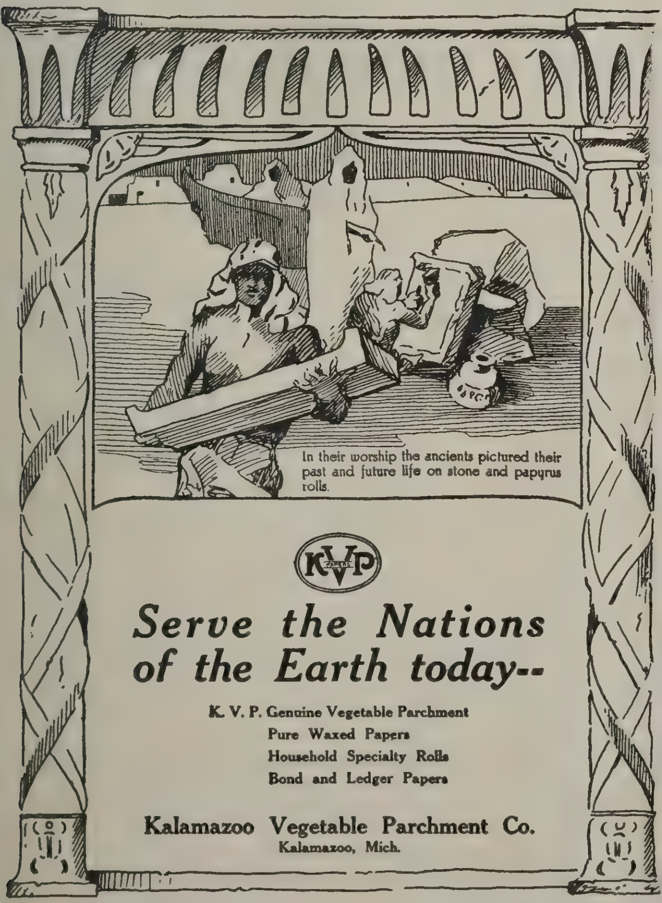
Mechanical Pulp

The quotations on mechanical pulp named in different parts of the trade indicate that prices are on a wide range. Some dealers in New York state they are selling ground wood at as low as $37 a ton f.o.b. grinding mills, while reports have been received, chiefly of Canadian origin, of transactions at as much as $50 a ton at pulp mills. It would appear as though prices depend entirely on the tonnage and quality of the pulp involved, the air dry test and the distance of the producing mill from the consuming point and the consequent freight on the pulp. Demand is reported holding up well, and grinders with very few exceptions are said to have but light stocks on hand. In some districts cold weather has set in and hampered production operations, while consumption is on a large scale, newsprint mills using ground wood at a rate which would leave but little surplus in the market for other consumers. An average price for domestic ground wood is believed to be about $40 per ton f.o.b. pulp plants.

Foreign and Domestic Chemical Pulp

The chemical wood pulp market continues soft in tone and yet with the winter drawing near and the time for last open water shipments from Sweden only a short space ahead there seems to be a tendency toward steadiness in at least certain parts of the market. Importers do not appear to be pressing sales as much as they were. Apparently they are more willing to hold any pulp they have unsold in expectation that a late season flurry of demand will send prices



In their worship the ancients pictured their past and future life on stone and papyrus rolls.

up, and it is a fact that bids from paper manufacturers on pulp have been frequently refused because the prices named were too low to satisfy sellers. Strong foreign unbleached sulphite has sold at 2.90 to 3 cents per pound ex dock New York, and foreign bleached sulphite at around 3.90 cents on the dock at this port. Swedish kraft is quoted at about 2.75 cents or slightly higher ex dock New York, and yet sales at less have been reported, one large sale to a board mill at substantially below this level having been made recently. Domestic pulps are moving slowly and principally on contract, and quotations are very irregular. Prices on an ex dock in New York and f.o.b. pulp mill basis are:

Kraft, domestic	2.75	@	3.00
Sulphite screenings, refined	1.75	@	2.00

Domestic Rags

The lower grades of papermaking rags appear to have steadied on the reduced prices levels reached a few days ago, and no further changes of much importance have occurred in other qualities though the tendency in most cases is in a downward direction, this being due to the rather narrow demand emanating from consuming quarters. Roofing stock is selling fairly freely at about 1.25 cents per pound f.o.b. New York for No. 2 packing and 1.40 cents for No. 1 packed, and 2.40 cents for miscellaneous packing f.o.b. New York, while old white rags are holding their price level. New cuttings are not over active and yet some descriptions are moving readily at maintained quotations. Prices f.o.b. New York are as follows:

New Shirt Cuttings, No. 1	12.50	@	13.50
No. 2	6.25	@	6.75
Fancy Shirt Cuttings	6.00	@	6.25
No. 1 Whites, repacked	6.75	@	7.50

Soiled Whites, house	2.90	@	3.15
Soiled Whites, street	2.65	@	2.90
Thirds and Blues, repacked	2.85	@	3.10
3rds & Blues, misc.	2.35	@	2.50
Black Cotton Stockings	3.25	@	3.50
Roofing Rags No. 1	1.35	@	1.45
Roofing Rags No. 2	1.20	@	1.30

Imported Rags

The movement of imported papermaking rags is somewhat limited at present. Most mills have covered their requirements for a time through purchases sometime ago and are now looking on without engaging in any additional important purchasing, but importers assert that prices are holding obroad and that therefore they are unable to reduce quotations. Dark colored cottons have sold to roofing paper mills at 1.35 to 1.40 cents a pound ex dock for spot lots. Quotations ex dock New York are:

Lins., White No. 1	12.00	@	13.00
Ger. Blue Cottons	2.75	@	3.00
French Light Blue	3.00	@	3.25
New Light Prints	6.25	@	6.50

CURRENT MARKETS—Continued

Bagging, Rope, Etc.

Firmness characterizes prices of old manila rope and this article is probably in a stronger market position than any other kind of papermaking material. Sales of No. 1 domestic manila rope have been reported at 7 cents a pound at dealers' shipping points, and it is stated that sellers with rare exception are holding firm for this price or higher. Foreign rope is quoted at 6.50 cents ex dock New York though sales at slightly less have been made. Old bagging is in slow demand and quoted prices are at about previous levels. F.o.b. New York quotations follow:

Gunny, No. 1	1.25	@	1.40
Foreign	1.25	@	1.35
Wool Tares, heavy .	1.50	@	1.75
Scrap Bagg. No. 1.	1.15	@	1.25
Roofing Bagging ..	.90	@	1.00

Wool Tares, light ..	1.25	@	1.50
For. Manila Rope..	6.25	@	6.50
Domestic Rope	6.75	@	7.00
Mixed Strings	1.00	@	1.25

Old Paper

Pronounced weakness still exists in the old paper market and prices have moved off to new levels on nearly every grade. Demand from mills is at a minimum; board manufacturers are buying on a very small scale, and there is not much call from other consuming quarters. Folded newspapers have declined to 80 cents a hundred pounds f.o.b. New York and sales doubtless have been made at less in some instances, while No. 1 mixed paper is down to 55 cents per hundred pounds New York, heavy flat magazines to 1.40 cents a pound, crumpled book stock to 1.15 cents, white news blanks to 2 cents, old No. 1 kraft to 2.10 cents, and overissue news to one cent per pound. Shavings also have declined further, No. 1 hard white being quoted at around 3.90 cents per pound, and No. 1 soft white shavings at 3 cents f.o.b. New York. Quotations f.o.b. this city are:

No. 1 Hard White Shavings	3.85	@	4.00
No. 2 Hard White Shavings	3.00	@	3.25
No. 1 Soft White Shavings	3.00	@	3.10

News, strictly overissue	1.00	@	1.05
Folded News	.80	@	.85
No. 1 Mixed Papers.	.55	@	.60

Twines

Demand for twines shows a tendency to increase. Business is of strictly routine character and yet consumers in at least some cases are absorbing supplies in slightly larger amounts. Moreover, prices evince a stiffening trend, which is due as much to strength in raw material as to improvement in demand for the finished product. Quotations are as follows:

Sisal Hay, pure ...	13.25	@	14.25
Manila Hay, pure..	16.25	@	17.25
Sisal Lath Yarn ..	12.25	@	13.25

American Light India—			
No. 6	19.50	@	
No. 7	18.50	@	

Chemicals

Papermaking chemicals are moving well on contract but current business is slow to develop. Producers are reported accepting contract orders for bleaching powder at slightly under 1.50 cents per pound at works. Casein is in fair call and quotations are maintained at an average of about 14 cents a pound.

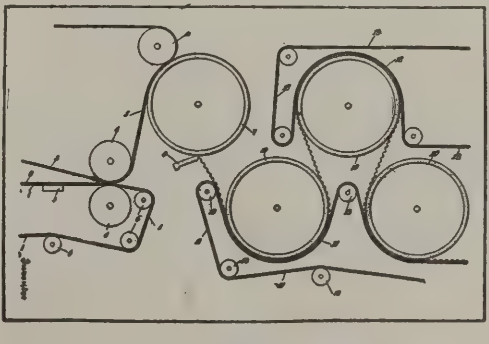
Improved Process of Creping Paper

The Best and Most Profitable

For the manufacture of CREPED PAPER Napkins, Toweling or Stretchable Bag Papers and Creped Packing or Crepe Wrapping Papers the system has no equal



The crepe being formed while the fibres are **steaming hot and pliable is dried without stretching;** not only retaining form better, but shedding less lint than cold creped paper products.

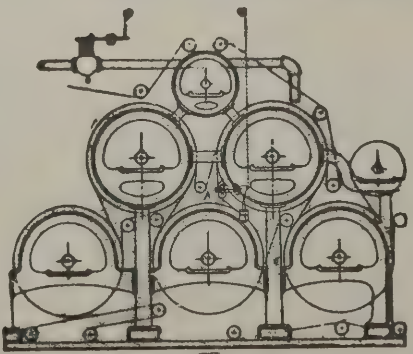
THE PICKLES DRYING REGULATOR



Reasons why you should have it on your machine are: First, it regulates the drying of paper automatically, irregularities are eliminated; second, higher machine finished papers are attainable, because it is possible to maintain the proper quantity of moisture in sheet, as it passes to calenders; third, mills having tried it on one machine have ordered it for all their machines. Full particulars upon application to

Manufacture of Pulp and Paper

IN FIVE VOLUMES

Being prepared by the Joint Committee on
Vocational Education of the Pulp and Paper Industry
Volumes I, II and III now issued.

Volumes IV and V are expected during the year.

The work is adapted to the classroom, to home study and for use as a reference work. Every firm and individual connected with the industry or interested in the pulp and paper business should own one of these sets.

The volumes issued are on sale at $5 a volume and orders may be placed with the Technical Association of the Pulp and Paper Industry, 18 East Forty-first Street, New York or with Hughes Publishing Co., Inc., Suite 418, 1478 Broadway, New York.

Vol. XXXIII NOVEMBER 29, 1923 No. 6

Standardizing Paper Quality

Operation of Papermaking Involves Knowledge of the Properties of Raw Materials, Especially of Fibers, if Quality Is to Be Standardized and Controlled

By **Hubb Bell** *and* **H. M. Holmes**
Members of Technical Association of the Pulp and Paper Industry

IT is a well known fact that the process of papermaking comprises the gathering together of certain materials consisting mostly of cellulose or vegetable fibers; removing all undesirable substances; tearing the fibers apart and teasing them by beating in a beating engine; adding alum, coloring matter, filler and sizing materials; and, after proper dilution, passing the product over a paper machine. While on the machine, the surplus water is removed, and the fibers mat into one continuous sheet. This sheet is dried as it is passed over heated rolls. The result at the end of the machine is a sheet of paper.

Control of Materials

It is quite obvious that in order to control the paper quality, it is necessary to standardize and control the quality of the materials which enter into the paper. The sheet of paper may be given any number of different treatments, depending upon the purpose for which it is to be used.

Once the paper is made, it is perfectly evident that the principal quality of that paper is its strength. All different papers are required to have different strengths. The factor which mostly governs that strength is primarily the quality of the materials out of which the paper is made.

A paper which is made from the very best of new rags, for example, is stronger in every way than a paper which is made from woodpulp. Of course, some rags make better paper than others. There are different grades of rags just as there are different grades of woodpulp, each of which affects the strength of the paper made from it.

Obviously, then, the first requisite in standardizing paper quality is to know exactly all the properties of the materials which are being used in the manufacture, establish standards for these materials and divide them into separate classses, so that the relative values of each with regard to strength in any given proportions will be known when matted into a sheet of paper. Once these standards are established all materials purchased must be carefully analyzed and tested by a chemist to make certain that when they are put through the process of manufacture of paper they will produce a sheet of the desired strength.

Vegetable fibers form the chief raw materials used in the manufacture of paper. Animal and mineral fibers are but rarely used; the former in the manufacture of some blotting paper, the latter for fireproof paper and boards. The vegetable fibers may be divided into two classes—rag fibers and rag-substitute fibers. The rag fibers are linen, cotton and hemp, while all the other vegetable fibers, such as esparto, straw, jute, wood fibers, etc., are rag-substitute fibers.

What do we know about the fibers themselves? We know that a single fiber is an element out of which a paper is made. This element repeated untold millions of times is what gives us the final, completed structure. What the brick is to the building, the fiber is to the paper. Now, as a matter of fact, we do not have any such accurate conception of the properties of the fiber as we have of the brick, and the main reason is that the fiber is so much smaller. Take the paper industry through and through, there is not one person in thousands who has any very clear idea of the exact form and texture of the single fiber, whether it be linen, cotton, woodpulp or what not. The fiber is not a simple element. We must not think of it as of a wire; that is, something of uniform size and of uniform composition. It is something much more like a long and exceedingly slender twig or withe, with its outer bark, inner bark, wood and pith. Not that the fiber has bark, wood and pith, but that it has features that may be fairly likened to them, for it does have an outer, intermediate and axial part, and all these vary from one another in physical and chemical properties—in color, density, strength, and chemical composition and in many other ways.

Then, as all these fibers are the result of growth, they are not uniform from end to end. In this again they differ from a wire, whose physical and chemical properties vary but little throughout its length. If the animal that grows wool or hair passes through a period of sickness this results in a weak point in the hair. We shed our hair after a severe illness simply because, during that illness, the scalp, along with the rest of the body, functioned so poorly that it could not build good, strong hair. Later on the hairs break at the weak points and we shed them. A similar thing happens to our finger nails so that for weeks after a severe illness there may be seen creeping up from the roots of the nail and towards its tip, until it is finally worn away, what anyone can readily see to be a different and, as a matter of fact, weaker growth. So with vegetable fibers—these vary and, like all plant growths, roughly speaking may be said to reflect the nature of the season in which they grew. Climatic conditions may give rise to a distinctly weak point in vegetable fiber as described for wool and hair.

Wood Pulp From Young Trees Best

In the writer's opinion woodpulp from, say, a three-year-old tree will produce a better paper than woodpulp from, say, a thirty-year-old tree. The younger tree will furnish a longer and more pliable fiber. Although the fibers are beaten, the more flexible a fiber is the better properties it will have. As an example, a more flexible fiber will take a color much better than one not so pliable.

All manner of paper is being offered today, sometimes under fancy names, usually without mention of the stock, and occasionally in a manner that is deceptive, whether intentional or not. Much of this has risen as the result of the honest effort of the reputable manufacturer to meet the popular and insistent demand for things that look better than they are and sell at a lower price than the genuine. It has been necessary to utilize waste fibers in order to supply these demands, and it is fortunate that modern paper operations and chemical methods have made it possible to start with an inferior fiber and produce from it a more useful and enduring material. It cannot be emphasized too strongly that fibers of all kinds have their economic uses, and any fiber becomes objectionable in a paper only when it is used for the purpose of misrepresentation or fraud, either direct or implied.

The difficulty which each purchaser would have in determining the truth of the printed or spoken advertisement about paper would not be so great as in the case of food, for instance, while the descriptive terms employed are easier to understand. The majority of buyers like to see what they are buying and flatter themselves that if they can also handle the goods they will know much of their quality. The problem of conveying these impressions regarding values to those who could not examine the goods confronted many merchants, notably those selling to distant customers; and while appearance and color may be accurately portrayed by modern printing methods, the only satisfactory way in which to describe quality is by use of terms susceptible of accurate statement, all of which are functions of serviceable usage. Certain unfair practices in the trade are growing up gradually and a fairly general use of these practices are forced by the competitive conditions in the trade.

Fastness of Color in Tinted Papers

Many Americans knew nothing of dyes and colors until the war came. They just took the wonderful colors and shades of modern synthetic chemistry for granted, and never missed the water until the well ran almost dry. Then when dyes of other than German origin came upon the market the training had been such and the propaganda continued to be such that these new dyes were subjected to tests which German dyes had never been expected to withstand, and under which many would have failed. In some instances merchants condemned colors without a trial.

The achievements of American dye manufacturers in co-operating with chemists make one of the brightest pages in our industrial history, but we should continue to want to know in advance how fast colors are to sunlight. This is important to the merchant and customer alike. For this it has been customary to expose strips of colored paper to the sun while a portion of the strip remains fully protected. This is a test which the reader can conduct with ease, the one question being that of time, since it is surprising what a small percentage of some days is recorded as full sunshine. It is also difficult to compare seasons and latitudes, so that an accelerated standard artificial test became essential. In 1920, sets of samples were exposed in Tucson, Ariz.; New Brunswick, N. J., and New York City. The samples were so placed that the noon sunlight would fall perpendicularly upon them. They were exposed only from nine in the morning to four in the afternoon each day, and were not exposed during rainy weather. During their exposure there were only a few cloudy hours and a few hazy days. Comparisons were made with the various electric apparatus on the market which produce artificial sunlight. It was developed that a standard was three weeks of June sunlight, and the apparatus employed produces results in one hour equal to one day in direct, full sunlight.

Standard Formulas

The materials having been standardized the next step is to make a set of standard formulas for the amount of each ingredient which is to be used in the making of each grade of paper. It is not an uncommon thing to have the same grade of paper run over strength in one lot and under strength in another. In nearly every case this trouble can be traced to the fact that the proportions are not the same, due largely to a difference in the consistence of the stock used. The usual weight of halfstuff may be dug from one drainer for the first lot and from another in the second. The chances are that the amount of water in each is different and since the water is weighed with the material it is evident that the proportions of dry stock will be different.

When the resulting paper is made too strong it means that the manufacturer has sustained a loss by using more high-priced material than was necessary and when it is not strong enough there is a likelihood that the order may be rejected or sold at a losing price, for the same reason.

It can be seen that the standardization of materials and of mixtures is fundamental and must be the first thing undertaken. The standardization of processes is equally important. The very best of materials may give widely different results, unless the treatment which they receive is uniform.

Standardizing Processes of Manufacture

The first step to be considered in the manufacturing process is the matter of beating—probably the most important process through which the materials pass. In fact, just ask any old paper mill man and he will tell you that in the beater room is where paper is actually made. If the stock is properly prepared in the beaters it is a pretty sure guess that there will be no trouble during the remainder of the process. In the beating engine the materials from which the paper is to be made are mixed with water, passed under a roll, from which there are a number of projecting iron bars, and over what is called a bed-plate. This operation is done in order to accomplish two results. First, to separate or tear apart the fibers, each one free from all the rest, so that they will be in a condition to mat properly on the paper machine, and second, to obtain what is known to the papermaker as "slowness" of the stock; that is, the fibers have got enough brushing and have been mixed with the water to the proper degree of hydration to allow the water to drain from the fibers fast enough, but not too fast, on the wire of the paper machine.

If this beating process is carried on too long the fibers will become too slow, that is, the water will not drain from them on the wire as readily as it should, consequently this means a slowing up of the machine and production. Also with this long continued beating the fibers become damaged and the resulting paper weakened. If, on the other hand, the beating is not continued long enough, the fibers are not sufficiently teased, and the stock is not slow enough, which means that the water will drain away too quickly, and the fibers will not be properly matted.

Another variable, which has to be taken care of in the beating process, is the matter of pressure to which the stock is subjected under the beater roll. This pressure is varied by the distance the roll is adjusted above the bed-plate. Experience has taught that this pressure should be varied at different stages in the beating, starting with a very light brush and tightening down on the roll at regular periods throughout the entire process.

The "Feel" of Stuff in the Beater

The final condition of the stock is said to be right by the way the stuff feels to the engineer who puts his hand into it and slips some of it between his fingers. Now it is a known fact that if identical materials are subjected to the same processes under the same conditions the results must be the same. Since most paper mills have three engineers and in the matter of beating there are none but the most general rules governing it, and the variables are controlled by the beater engineer's judgment, which is without doubt different in all three cases, the stock which is declared right by each of the three engineers would vary to a considerable degree, if slowness tests were made.

It is possible for a paper manufacturer to establish standards for beating, but first it is necessary for him to make systematic observations on all grades of paper which his mill makes, study each controlling factor in its relation to all the others, formulate his results, and from these derive for each grade his absolute standards for different pressures and time of beating. This done he is no longer dependent upon some experienced man's judgment as to when things are right. He is then in a position to tell any man in his employ just what to do in any case, and be sure that the results will be uniform and right.

Paper Machine Speed

Another important factor in the output of a paper mill is the speed at which the paper machine may be run. Of course papers of differing textures require the machine to be run at different speeds, some will not permit a very high speed, which others must be made very slowly. But the question before the manufacturer today is, What is the proper speed at which each kind and grade should be run? Here again a great many variable conditions enter in which must be standardized before the corerct speed can be determined. The stuff as it comes to the machine must be mixed with the proper amount of water to insure a good matting of the fibers. The shake of the wire and the suction boxes must be so adjusted that all excess water will be removed properly. The temperature of the drying rolls must be of the proper degree.

Too often paper machines are slowed down to remedy some trouble instead of getting at it from its source, consequently there is a falling off of production, which means a loss to the manufacturer. Once all other conditions are standardized, there may be calculated a standard speed for the machine on each grade, and the output and cost of manufacture estimated with perfect accuracy.

Standardization in the Finishing Room

These same much-talked-of principles, which apply to the actual making of paper, may be applied throughout the whole finishing process through which the paper must pass. Such as standardizing the number of sheets that can be handled most easily, the speed of all machinery in finishing process, number of sheets most efficiently used under a trimming knife, standardizing methods for wrapping and sealing packages, proper number of employes to handle each bit of work, etc.

The amount of work connected with the standardization outlined will without doubt require years to complete, but the fact that standardization has been carried to such an extent in many other large industries and has proved a great benefit to them is certainly evidence enough that the paper industry should be working under the same conditions.

Once all the processes gone through in the manufacture of paper have been standardized and we have a standard sheet of paper coming from the machine, it is necessary to build up a number of standard tests for quality which the paper must meet.

This step should be comparatively easy, now that the paper industry has the official standard methods of the Technical Association of the Pulp and Paper Industry.

Strength or Quality Tests

It is perfectly possible for an old papermaker to tell with a great deal of certainty upon examining a sheet of paper, much of the processes which the stock has been subjected to, and from a goodly number of widely different papers pick out the one best suited to the purpose for which it is to be used. But appearance is by no means the best guide. A paper may be made of all rag and yet be deficient in strength which, as said above, is the principal quality of paper.

One papermaker is quoted as saying,—"It is our experience to find that paper made of new cuttings and a reasonable amount of sulphite pulp is a better product and has a longer life than paper made of all rag when the rags are old rags and the strength therefore poor; it is not so much the formula that is used in making paper as the qualities of the stock which should be considered for standardizing."

Such being the case then the statement, "This is a 100 percent rag sheet," means nothing in terms of quality or strentgh. Strength or quality tests should always be made both with and across the grain of the paper to determine uniformity of the sheet. However, perfect uniformity is not practicable owing to the methods of manufacture.

Paper testing has been in use for many years by experienced manufacturers for the purpose of determining relative values for these important characteristics and insuring themselves against defective papers and undue costs. From these tests they learned to recognize certain limits for each property outside of which they did not care to go. These limits vary, of course, with different kinds of paper, depending on what conditions they must withstand in use.

One would therefore, naturally expect to find these limits defined or classified in a quite definite way; but investigation discloses that no one can define a class in definite terms with numerical coefficients.

Consumer is Most Benefited

The consumer who is found in almost every line of business is the man who benefits mostly by paper testing. He often spends large sums of money on the item of paper alone and as a rule has no way of judging the character or quailty of the paper or its suitability to his particular needs, except through observation or the word of the salesman, who is chiefly interested in making a sale. Papers may look and feel much alike and yet be widely different in quality and have many widely different properties. Paper testing here performs the duty of determining which sample represents the best value for the money. The consumer can make the seller submit samples and estimates of the kind of paper he wants. With this data he will then have a chance to compare the kinds and qualities of paper on the market and the prices of the different dealers.

Paper testing is also of value because it shows whether the paper is up to specification and the consumer is getting what he contracted for. It may be stated that paper testing in general is of use:

1. In determining the best value for money paid.
2. In buying on specification, determining which paper submitted is most suitable and economical for the intended purpose.
3. In insuring uniform deliveries and maintenance of quality.

The thing that is now needed to bring about the desired definiteness in the standardization of paper quality is that all the accumulated experience in terms of tests be brought together and analyzed with respect to the bearing of these properties individually to conform to the tests and limits found desirable in practice, independently of the classification as it now exists, and with respect to the limits to be set for each property. It is only necessary to have the consumers agree on the specifications, and to be able and willing to have tests made to insure them that they are getting what they specify.

Until we have standards of quality in terms of tests rather than those of purely commercial consideration there will always be many cases wherein the price a man pays will be highest for paper made from the least valuable material. Already some manufacturers have seen the wisdom of standardizing their product in all respects, and while it has resulted in the loss of a few customers the net result has been very much of a gain. Both manufacturer and consumer will be benefited by standardization because the manufacturer will be able to market a uniform standardized product, and the consumer by knowing that his goods will be uniformly up to specifications.

Buyers are Demanding Guarantees

Under normal business conditions the stress of competition calls for the utmost care and effort to maintain quality of product at all times. During the flush period following the close of the world war the necessity for this care occupied a less prominent position as compared with the imperious demand for greater production, and there was a rather general tendency to favor quantity at the expense of quality. This time has been relegated to history, however, and it will be found that buyers are now critical in their purchases and are demanding guarantees that quality will be maintained. This critical attitude, on the other hand, benefits the seller in equal measure, provided there is a recognized standard by which to measure quality.

Graphical Control Combustion Gases

The accompanying diagrams were accidentally omitted from our issue of November 22 in connection with the article on "Graphical Control of Combustion Gases" by Dr. Rudolph Siebers, Kramfors, Sweden. References to these diagrams will be found in the article in question.

Waste in the Sulphite Industry*

Faulty Processes and Methods Responsible for High Costs—Changes that Will Add to Profits—Good Crew a Big Asset

By **O. L. Berger**

of G. D. Jenssen Co.

THE old proverb "A penny saved is a penny earned" holds good today more than ever and especially so in our industry where the profit of the mill generally depends upon our ability to save what we wasted a few years ago.

The actual physical waste of material during the process of turning wood into sulphite pulp is pointed out to us every day and I shall not speak much about that phase. I shall rather try to point out waste which is caused by faulty processes and methods, or where savings could be made if old methods were changed for those that are more recent and more improved.

There is absolutely no excuse for waste that we can detect with the five senses nature has given us. If such wastes are allowed to continue something is radically wrong and thanks to co-operation and propaganda we find that what is generally called "a bottled up mill" todav is more a rule than an exception.

In the manufacture of sulphite we find the eternal triangle: quantity, quality and economy. We find that it is hard to maintain a high average of all these at the same time as it is self-evident that by forcing one the others are bound to suffer. If we desire quality the production will be reduced and the cost go up. If we, on the other hand, desire a high production, we may lower the cost but are bound to sacrifice the quality. The governing factor is the selling price of the product and in deciding upon the policy of a mill it is well to remember what is really wanted and then aim to produce what is wanted as economically as possible. I believe that much money is wasted in our industry by loss of energy caused by faulty conception of what is to be accomplished and how to accomplish it.

Major Items of Cost

The five major items making up the cost of sulphite pulp are wood, chemicals, steam, power and labor. Your cost accountant knows the cost and each of these items and I would advise you to find out from him and check up from week to week.

With your permission I shall try to analyze each of these items rather than to discuss the operation of each department.

Wood.—Those mill owners who are fortunate enough to possess limits of their own are responsible not alone for delivering the wood to the mill at a reasonable cost, but more so for proper woods operation, forest preservation and reforestation. They must maintain their supply of wood without cutting into the capital of the company and the resources of the country.

When we shall realize the crying necessity of securing a permanent supply of raw material for the paper industry, which is so closely allied with the progress of our country, then and only then will we take the necessary steps toward stopping waste in our forests and this can only be accomplished by changing the methods we use today and run our woodlands on a scientific basis.

We can get along without many necessities and luxuries of modern civilization but it is indeed hard to picture ourselves cutting down the use of paper for writing, printing, wrapping and all its other modern uses. You have all heard of the printers strike in New York a few weeks ago. Can you imagine a city the size of New York without the morning paper? The people were dumbfounded and felt as if they were isolated from the rest of the world, not knowing anything about their favorite scandal, the baseball score or the European situation! It takes a situation like that to bring home to us the power of the press and the necessity of a steady supply of paper, which again means pulpwood.

The introduction of the barking drum has probably done more than any other invention to help us in decreasing waste of wood and in addition to this I shall only call your attention to the necessity of making a careful test of the chips so as to make sure of a proper conversion of the wood into finished chips.

Chemicals.—The chemicals used in the sulphite industry are sulphur and chlorine and I will also include under this heading lime and limestone.

All sulphite mills in this country use sulphur or brimstone in its metallic form, while we find many mills in Europe using pyrites. The low cost of sulphur in connection with the simplicity of its combustion is a pretty good guarantee that we shall never go into the use of pyrites for sulphite acid. In localities like Alaska, with high freight rates and rich pyrites near the mill, it is no doubt possible to produce the sulphur unit cheaper from pyrites than from brimstone. but the cost of the roasting installation must be taken into consideration and the absence of Selenium in the pyrites is also absolutely necessary.

In this country nearly 70% of the acid for sulphite is made from limestone. The difference in the cost of lime and limestone should in itself be a positive proof of the advantage of the limestone. Claims of the superiority of milk of lime acid on account of the advantage of a high percentage of magnesius has yet to be proven and, furthermore, there are today many mills using a dolomite stone in their towers where calcinite is not obtainable. The mills using lime as the base for their acid could save one dollar per ton of pulp by changing over to limestone. Just a matter of calculation.

The question of using bleachpowder, liquid chlorine, or electrolytic cells is one which depends entirely on freight rates and power cost. Many mills are today operating electrolytic cells who could better afford to buy the powder or liquid chlorine, while where power is cheap, production large and salt easy to obtain the home made bleach naturally is of advantage.

I think that most mills in this vicinity who still are using powder could make money by buying the liquid chlorine simply by taking into consideration the losses of available chlorine and changing of the chemical composition of bleachpowder during storage. A bleachplant may run perfectly satisfactory as such with minimum losses of chlorine and a low consumption and a careful investigation may prove that money could be saved by a change in method as indicated above.

The direct saving in chlorine by the use of high consistency bleaching is another matter which should not escape your attention.

Boycott the Steam Plant

Steam.—Our old friend "Hook 'er to the Biler" has finally passed to his reward. It doesn't seem so very long ago that we had the daily fight between the head fireman and the cook when the cook's main ambition was to pull down the steam to make the fireman work. "Them days are gone forever." We know now how much steam it takes to cook a ton of sulphite and the flowmeter tells the story better than the recording pressure gauge.

By proper manipulation of the digester there should be no extremely heavy pulls on the boilerplant and the ideal condition exists in Scandinavian mills where a steam storage battery, the so called vaporaccumular, will take up any peak loads and furthermore stores excess steam during low peak periods. There are now a couple of these accumulators being installed on this side and we can expect some interesting developments in this field.

The utilization of the relief heat has been successfully solved by the Decker process which, according to recent tests taken at Kenogami, P. Q., will bring the steam consumption per ton of pulp down below 4000 pounds. The average mill uses today around 7000 pounds, so the saving can be readily caculated when we know that the cost of steam is at least 50 cents per 1000 pounds. We can't fool the flowmeter and the only way to get even with the steamplant is to boycott it and cut down the steam consumption.

The insultation of the digesters is bound to save radiation losses and I have seen figures on these losses varying from $100 to $1500 per year for a 10 ton digester. I understand that it costs $1 a square foot to cover the shell properly and again it is a matter for the costman to figure out. One reason insulation is used so generally in Europe is that they use a three inch lining while we on this side use a seven inch lining which, of course, is a better insulator in itself.

Where we dry our sulphite it is necessary to evaporate the water remaining in the pulp after it leaves the presses. This water amounts to 3000 pounds per ton pulp if the test is 40% air dry when the pulp enters the dryers. By the use of the Kamyr press this water can be reduced to 1650 pounds and a consequent saving of over one-third of the steam necessary for drying the pulp is the result.

I mentioned before the use of high consistency in the bleach plant. If this is used it is possible to bleach cold and even if a high temperature is used it is obvious that the less water the pulp contains the less steam it takes to heat it.

It has been proposed to condense the steam escaping from the vomit stack during the blowing of the digester.

The water used in condensing this steam amounts to about 1500 gals. per ton of pulp, can be used for washing the pulp in the pit and for logponds in the winter and many be of special benefit in certain localities.

The blowoff liquor also contains great amounts of heat but the equipment necessary to recover this heat has not been developed so as to work in with the mill operation.

Power.—Thanks to our efficient engineers the use of individual motors replacing line shafts driven from reciprocating engines so generally known a decade ago is now almost universal. The friction losses in the bearings and multitude of belts and gears in the old mills were immense not to mention the loss in operation caused by the constant shutdown for repairs on belts and hot bearings.

The use of high efficiency pumps is still badly neglected by many and could be the cause of considerable saving if installed. Many mills are also using high pressure water throughout their wetroom when it is only necessary to use about 7 pounds on all showers and no pressure at all on the mixing boxes. The only high pressure water needed in the wetroom is for the blowpit hose, which should have at least 40 pounds and for that reason should be supplied from a separate pump.

In some cases unnecessary power is used because the mill is not designed right. The cheapest way is to lift once and then use the natural flow by gravity as much as possible. An extra story of the building which would enable us to place the screens a little higher would probably save an extra pumping of the whole production if a thickener or riffler is to be used.

In the wood room we find more waste of power from inefficient conveyor installation while in the acid plant where milk of lime is used the power could be cut in two if limestone towers were employed.

I shall just mention a recent invention, U. S. patent No. 1,466,413. This patent refers to the introduction or air in pipe lines for pulp to facilitate pumping of heavy stock. We know that it is nearly impossible to pump stock heavier than 4% with an ordinary centrifugal pump. If air is introduced it is possible to increase the consistency considerably, thereby decreasing the power consumption per ton. My idea of an efficient sulphite wetroom is one where the pulp is diluted and kept in suspension in the blowpit at 6% and pumped by the use of this new pumping scheme direct to the screen at an absolute uniform consistency, thereby not only saving the power but eliminating the blowpit man as the screenman could adjust the flow of pulp from the pit at will. This scheme is now going to be tried out in one of our leading sulphite mills and we will soon know how it is going to work out.

Under this heading I will also mention the Bullard gaswasher and cooler, although it would rather come in under general efficiency. Outside of the fact that washing of the SO_2 from the burners removes SO_3 and free sulphur, an installation of this kind as a cooler will save power as it is possible to cool the gas by direct contact with a fraction of the water necessary with our present gas coolers.

—**Labor.**—Although the cost of labor per ton of sulphit only amounts to one-third of the cost of the wood, it is safe to say that a good crew is the biggest asset any mill can have.

The average mill today employs about two men per ton daily production and this varies with local conditions. There are wonderful opportunities to reduce the payroll by installing labor saving machines and time saving devices and as a mans wages will pay interest on a $20,000 investment it behooves the superintendent to look into this and keep his mind open to improvements in mill equipment.

But outside of the actual saving in labor and reduction of the payroll, we have the co-operation of the men and their goodwill towards their superintendent and their company to take into consideration. We hear so much about Ford methods, motion studies and mass production where each man is a piece of a big machine and does his work automatically regardless of individuality. In a sulphite mill this method cannot be carried out as it takes more than that to be a good acid maker, cook or even rollskinner.

And here is where the superintendent can accomplish the biggest saving because of the fact that it is up to him to get the very best out of his crew or get them antagonistic and careless.

It has been my personal experience that it is good policy to advise with the men and get their opinion in matters pertaining to the operation of the mills. I feel that no superintendent knows everything and that the combined experience of his whole crew is better than his own. He

Waste in the Pulp and Paper Industry*

Waste in Every Phase of Papermaking Operations Is Sufficient to Turn Losses into Profits and Prevent Many Failures

By B. T. McBain

Assistant General Manager "Nepco" Mills and Third Vice President Superintendents Association

I AM from the Pacific coast with thirty years behind me in the paper game, having started in 1893, but I don't think I know it all.

My paper business knowledge comes from half that period in contact with the president and later as manager of the largest mill company on that coast and my manufacturing experience under and with Uncle John Lewthwaite, the dean of paper makers in that far western empire, now 80 odd years young, and still looking for new things in the game.

Do not take it from what follows that Pacific coast mills are perfect. They are the equal of any anywhere; but are not by any means free from waste. By knowing what they are doing in many ways, I know what not to do and many of these things are in the column of waste. They are very wasteful of everything; but particularly wood, power and labor. They do not know it, however, and will not believe it, like many others.

I do know, however, the advantages they have over mills in the East and middle West in timber supply, power, water and steam and where the present available powers and timber belts of the future American paper industry are located, which I believe makes my survey of the waste problems in mills, East, West, North, South and middle West, near enough correct to warrant making record of it.

Pulpwood Wasted Everywhere

In the first place, there is enough good pulpwood wasted each year in the logging camps of the Pacific Northwest to run many of the eastern or middlewest paper mills, yet no seeming effort is being made by present mills to conserve their natural resources and to stop this waste. Pulpwood, however, is not alone being wasted in Pacific coast logging camps. It is being wasted everywhere, though in a lesser degree. During the past four years in the middle West and East, I dare say that from 10% to 20% of the total wood cut has been wasted from rot, disease and insect life, depreciation of value being chiefly due to the rush to secure supplies and the evident thought that the end of wood growth had been reached. Some mills have the fruit of such wastefulness still in evidence, as a guide to the future. The new wood condition which faces the industry in America is a very serious one, indeed.

Canada, as you have heard, has recently authorized the placing of an embargo on exportation of privately owned timber. This law was passed for a purpose and sooner or later will, no doubt, be made effective. Many American pulp manufacturers will then be deprived of a wood supply. Then, where will they look for it? The South and Pacific coast or Pacific northwest states afford the only outlet of any size in America and only cerain grades of pulpwood grow in the South. The only alternative is "Move over into Canada" or purchase Canadian or other foreign pulp from across the water. This means greater demand for foreign pulps, higher cost prices for raw materials, and greater finished paper costs.

Many of you here are representatives of conversion plants, and I might see in some minds the argument "Why should we worry". Gentlemen, whatever injures one of us in the industry, is felt indirectly by all of us. This seems a broad assertion but before the end, I think you will agree with me. Shortage of wood, means shortage of pulp—shortage of pulp causes higher prices, therefore, and possible shut down, meaning higher cost of paper; but you might say too, higher selling price. Will the selling price be higher in proportion though, with possible cheap paper offering from Canada and other foreign countries.

Others say there are very little book, writing and board made in Canada. That may be so; but what is to hinder making it there? There was very little newsprint made in Canada but a few years ago—look at today's condition.

I recently read a paper at the superintendents annual convention at Springfield, Mass., which has been published in the Year Book and in many of the magazines of the industry. Parts of that paper are incorporated in this one by request of the committee arranging this program.

I have recently had to do with the designing and building of a new paper mill. The first machine was started July 23rd on the date set for it to start. This mill is the nearest to a wasteless mill that I have seen yet. All the water and stock going away from the plant must go over the machine room floor and you can rest assured that very little goes that way when those in charge must clean up the mess. It is no longer in the experimental stage. It can be done, has been done and is being done at Port Edwards, Wisconsin.

Synopses of Former Papers

Time is Life—Time is the stuff that life is made of. Don't waste it. If you have a minute time to spare, use it to improve yourself; prepare yourself to fill the shoes of your superior officer next above and prepare your assistant to relieve you of the burdens of your present position.

Waste—A Disease—My subject touches upon one of the most vital diseases of the pulp and paper industry today; yes, of every industry in America of everything American, as I see it and by this I mean the United States and Canada. We have had so many years of plenty that we have become careless, yes, even to the last degree. I think we waste enough of everything each year in the pulp and paper industry alone in America to run a 200 ton mill full product, for many years. By we, I mean all of us, you and you and you and myself.

Extravagance—During the World's War, which seems yet to be bothering some of our Allies, we in America became careless, extravagant and wasteful. We made large sums of money; the returns to the manuafacturers were large; the profits great. We could have everything and anything we wanted. If what we had didn't suit, we charged it off, threw it away and bought another. Everyone seemed to forget there was to be another day; tomorrow was not thought of; we all lived for the present, like the gnat which is born but today, yet today must die. Overnight, the change came. We hardly knew how to meet the situation; had dollar ideas and penny incomes. We had driven to our work in high powered cars, if we worked at all; we had been used to two men for every job. The new situation was not understandable; surely it wouldn't, couldn't last long. Some woke up early, wrote off their losses and

---

** Paper read before joint sectional meeting of Michigan Illinois division of Superintendents association at Kalamazoo, Sept. 20, 1923.*

started anew; others thought to beat the new conditions; but that couldn't be done.

Profit Must Come From Waste—Today many of us are still hoping against hope that the price of paper will go up enough to allow us to show a decent profit. Gentlemen, the sooner we put that idea behind us, the better. What we must do is, get busy, use all the authority we have and even exceed that authority to stop present, and prevent future waste. It is everywhere—in some form—waste in wood, in raw material, in finished product, in sales.

Worse Than Stealing—To waste, in my opinion, is worse than to steal. That is a hard thing to say, because all of us are in the waste column. If we are, and are not making every effort to prevent waste, we are doing worse than stealing what we are wasting. Why? If stolen, usually someone gets some good out of the stolen article. If wasted, no one does. Stealing can be stopped; so can waste. The law prevents stealing. The law should be as strong against waste and should be enforced. There is no law ,however; common sense should make us all stop it. It is waste today that prevents many American manufacturers from showing in the profit column instead of in the red. It is waste today in my opinion, that prohibits many American manufacturers from getting into the export business and doing some business with the markets of the world at a profit, instead of at home, alone and at a loss.

Can Increase Production—I have been preaching this anti-waste doctrine for many years. In one large mill the campaign we started netted 20% greater production and a very material reduction in cost. In others while the returns were not so great, the increase by savings alone put the business on the right side of the ledger.

There are many mills today, mill officers, mill managers, mill superintendents, who will sit back and say "That don't mean me, I am not guilty." Yet when you go into their mills, you will find stock wasting into the river, waste in power, waste in steam, waste in coal, waste in everything, but particularly waste in labor.

Specialists Needed—We all have specialists in our mills in our particular line of manufacture; but few of us have specialists in the saving of waste. Most of our mills employ cost accountants, and rightly so, who put in expensive systems to watch the disbursement of nails and like material from the mill store, the amount of paint or aniline delivered to the mills and the woolen felts, wires and jackets delivered to the machines, but the value of these same articles is being wasted many times each day in other ways, without any way of checking them. What the boss doesn't know, doesn't hurt him and nothing is being done to prevent this loss—waste.

Generally Speaking—I can start from the wood lot and follow the wood to the mill, through the various processes to the car and even to its final use in the plant of the consumer, whoever he may be and show you waste; yes, waste to the point of making you disgusted with such an industry if you didn't have the right and the authority to stop it. Go home, gentlemen, for a few moments. Your minds are now on your daily work. Follow me through your plants, please:—

The Wood Pile—The wood in the pile—see that rotten log? That tree should never have been felled; but if down before its value was determined, it should not have been shipped. Waste of labor in cutting and loading, waste of freight in delivery, waste of labor unloading and worse than anything else, rot and worms go together, your log pile is endangered by contact with it. There are many such logs; great is the waste.

Methods of handling wood from pile to mill make it necessary to deliver these logs when their turn comes, more waste of labor, the quality of your product is endangered. An error happens, some of it gets into the chip bin or goes to the grinder room. It is not even good fuel, you get no product from it, waste of all equipment and labor in the handling ensues; but you do get dirt and in the case of greenwood, you get infection which shows up in the pile of stored laps and then again there is waste.

Power Machinery—See that engine running that wood room? the exhaust steam can be used; but is going to waste. Another wood room is operated by direct connected water wheel installed thirty years ago, probably never cleaned since installed and wasting over half the water going through the flume while the number of gears and belts in use show another waste of 25% to 50% of the power the wheel does produce.

If an old, out of date water wheel must be used, it will pay to get a small sand blast and give it a thorough cleaning inside, at least once a year. The waste in most plants on this account is great, many times almost 50% of the possible power. But if you do clean them, know that they are cleaned inside, don't take someone's say for it.

The Boiler Plant—Look at the steam pressure—some mills are still using boilers that are little better than junk. Steam driven pumps, hand firing of coal, poor handling of hog, improperly designed furnaces, poor draft, lack of meters on water and steam, improper control of air, etc., are all points to show whether the efficiency possible in the boiler room is at a point where there is sure to be waste. Coal costs for power and heating are putting many mills to the bad.

Fire System—Are you using the steam fire pumps for general service and work where an up to date centrifugal or plunger high efficiency pump would pump twice the water for half the cost? Is your fire pump of any value for emergency use in case of fire if it is being so used?

Labor—Follow the wood to car or to the pulp mill grinders or chippers and check up on each man. In most plants 10% of the labor is waste; in some, considerably more.

Fibre Mills—Because of the length of fibre, the loss is not so great as in groundwood plants; but there is waste from chippers, poorly made chips, chip screens, blow pits, screens, deckers, wet machines, liquor waste in making, steam waste in cooking, liquor waste in reclaiming and recovery, chemical waste in possible by-products, sludge waste in soda and sulphate. Some soda mills are saving 85% of their original lime by recalcining their sludge. Laws prevent the discharge of sludge and other mill waste into streams. Thank the law.

Pulp Grinders—Check up the power used per ton of pulp on the grinders. Some mills are wasting from 10% to 40% of the power on the grinders because of improper or insufficient use of burrs, poor supervision by foremen; not running the stock at proper temperature, poor speed control, and various other reasons.

Pumping Equipment—Follow the pulp from grinder pits to screens. Very poorly designed, out of date pumps are wasting 25 or 50% of the power used, either because of over speed or of improper type for the service.

Screens—The screens in many mills are discharging or rejecting good fibre because of the speed of screens or improper consistency of the stock, waste of power and fibre, as well as labor and equipment producing the wood and pulp to the screens.

Thickeners—The deckers are leaky and are passing good stock around the ends of cylinders, due to poor packing and poor maintenance. "But that isn't being wasted," I hear some say, "because we use all our white water;" but in following up all avenues of waste of white water, a large stream sometimes as rich as 4 pounds per 1000 gallons, is found wasting into the sewer and river, 4 pounds in 1000 gallons is 10% of the original consistency of the stock at the screens, or going to the deckers, and what is commonly called ½% consistency.

Screenings of Value—The tailings rejected in most groundwood mills are considered of little value. Some are saved and sold in good times; but in poor times, wasted. These contain some of the best fibre of the log. In grinding wood, two distinctly different fibres are encountered; the hard, annular rings and that soft punky intercellular material between these rings. In my opinion, two distinct and different processes are necessary to properly handle these two kinds of fibre; that which the screens reject must be handled by a refiner, many good types of which are on the market and are in use in some mills, making marketable No. 1 pulp out of this waste. Again, the pump from decker chest, the agitator, the belts and gears in use, are all wasting power for one reason or another.

Beaters—The beater line is not run up to speed on account of overload, or low voltage, or dirty runners in water wheels, for one of many causes and the beaters are operated 10% or more slower than they could be and the beater rolls have not been ground perfect and true; waste of capacity, beating surface, labor, everything before and possibly everything following, because in some mills the machine production is governed by beating capacity.

Piping—Follow up into the machine room basement. Water and stock pumps are all wasting power. Why? Because of improperly placed or poorly designed and too small piping, as well as old, worn out pumps placed when the paper machine was running 250 ft. are still being used with the speed at 500 feet or more, by simply speeding them up—waste.

Paper Machine Screens—Are the paper machine screens wasting stock? If any fibre is being rejected, it has a value—save it. Why withhold these causes of waste longer from the junk man? There are probably half a dozen water pumps supplying water where one central water system with proper filter would do the work with a saving of from 50% to 75% of the power, saving also maintenance, labor and material.

Suction Pump—What kind of a suction pump is used and is it doing its work in an economical manner?

Clothing—Look in to the life of wires, felts and jackets—why does the felt wear out in two weeks with old rusty iron felt rolls when with rubber covered rolls the life might be doubled—waste. Where is the white water going from machine mixing box and how much is being wasted from the saveall under couch?

—Steam for Drying—Look into the drying pressure and use of steam per pound or ton of paper and get someone versed in the scientific drying of paper to show you where you can save the 25 to 50% of the steam now being wasted and how you can get more paper and better paper at the same time. Again, the vapor arising from the paper is probably being blown out of doors and wasted, while it contains valuable heat units for re-use either in drying, or in heating the room, or to supply hot water for various production purposes. Heating engineers are available at no cost, to explain this waste.

Broke—Follow the paper from dryers to calenders, to reel and to winder. Weigh the broke that goes through the convenient broke hole, or holes, into the basement. Some mills show as high as 15% of the paper made going back to the heaters as broke—waste that can be cut in two, three and even four by proper follow up; there's a reason for all waste. Eliminate the cause, no matter who or what.

Hoods, Etc.—Dryer felts are many times damaged or worn out before half their proper life is gotten from them. I have seen this caused by sulphuric acid in the sulphite used or from excessive use of alum, also by improperly designed hoods, causing a wet streak that even a dryer felt could not correct. The shorter life is waste, remove the cause. An hour per day average is enough to wash up and change clothing. If more is used, it is wasted.

Programs or Running Schedules—I might just refer to improper handling of orders, too frequent changes of weights and quality as a cause for waste—making grades for which the mill is not properly equipped—another waste; careless handling of the paper in the cutter and finishing rooms; on the cutters and by the finishers.

Dissatisfied Customers—The cut price salesman is a great source of waste. In fact, a dissatisfied customer is waste, especially if the product delivered must be sold a second time to the same or a new man. I could write of waste and fill a large book; the more one studies the subject, the more places he finds where dollars have been and are still going to waste in one form or another in almost every mill. Industrial accidents are a waste in many ways; how some mills get by without wasting more lives and limbs is beyond me.

He Who Knows it all—But, one of the worst causes of waste is the superintendent who thinks he knows it all, who thinks he is too proud to belong to this section of the American Paper & Pulp association, for the man who thinks he knows it all and cannot learn from his fellow man, his competitor, if you please, is not only going backward, but is at a point where others can learn little from him, except not to do as he does.

Eyes But Cannot See—The next worse cause of waste is the owner, the manager, or the superintendent who will not see when his errors are pointed out to him. He does not deserve to and cannot be expected to get into line.

Savings Reduce Cost—However, I believe that with the saving of all forms of waste in the pulp and paper Industry, many plants now in the red can be put into the pay class, not by demand increasing the selling price; but by the savings reducing the cost.

Waste in the Sulphite Industry

(Continued from page 9)

is the general that leads the battle but the shooting is up to the individual soldier.

If the men feel that their opinion is respected and their suggestions followed they are eager to suggest and help while on the other hand they are easily hurt if snubbed by the boss.

The superintendent that feels his responsibility to such an extent that he asks no advice from his help and is afraid to lose prestige by admitting his shortcomings will always carry his burden alone and the crew will enjoy seeing him in trouble.

We can install everything possible in the way of charts, records and red tape to promote efficiency but when it comes right down to facts the mill where everybody from the manager down are working in harmony is the most successful and the mill where the best results are attained.

In closing I wish to say that the successful operator is the man who is up-to-date, who is willing and anxious to profit by other people's experience and I know of no better place to get new ideas than at a meeting of this kind where practical operators come with an open mind willing to give and take.

The Northampton Paper Stock & Mill Supply Co. at 106 Hawley Street, Northampton, has been purchased by Burt Michelman. He will continue the business at I Isabella Street.

New York Superintendents Meet

Northern New York Division Makes Good Showing at Carthage Meeting—Interesting Papers Presented—Dr. Baker Talks on Forestry

ONE hundred members of the Northern New York division of the American Pulp and Paper Mill Superintendents Association convened in Carthage for their fall session on Saturday afternoon and evening, Nov. 17. Frank P. Wilder and John O'Connell of the Diana Paper Company of Harrisville, had charge of the arrangements for the meeting.

The afternoon business session was held in the rooms of the Carthage club with the banquet and evening business session at the Elmhirst hotel. The members of the association arrived in Carthage at noon Saturday. At 1:30 the entire party left for a visit and inspection of the local mills.

Homer Stafford of Watertown, chairman of the division, called the afternoon meeting to order. William J. Argy of the St. Regis Paper Co., Black River, N. Y., presided as secretary and a stenographer was present to take the minutes of the meeting. Mr. Stafford welcomed the members to Carthage and assured them of some interesting papers concerning vital matters relating to paper mill problems. He urged all the eligible men present to sign up the application for membership saying that he knew they all wanted to join an organization of this type. He brought out the fact that the more members the stronger the organization.

Synopses of Papers

A. J. Darling, of the General Electric Company, delivered the first paper on "Steam Turbines and Power Transmission as applied to Paper Mill Practice" bringing out some interesting facts which were listened to attentively by the members. Following his speech his paper was the subject of general discussion among the members and Mr. Darling answered many questions on various parts of his paper. Several other members took the floor to ask question or explain several points. At the conclusion of his paper Mr. Darling was roundly applauded by the members and was thanked by Mr. Stafford, chairman.

"Powdered Coal and Boiler Equipment to Go with Same," was discussed in a paper given by F. W. Dean, of Boston, who is a manufacturer of such machinery. His talk was clear and logical to the last detail and he presented a strong case which seemed to convince the members that powdered coal and its accompanying equipment were the solution of this difficult and expensive part of paper mill costs. He was strongly supported by Robert G. Argy, who said that equipment for powdering coal and accompanying boiler equipment had been recently installed in his mill, the Cliff Paper Company of Niagara Falls, and was rendering complete satisfaction. Features of the use of powdered coal were the complete absence of dust which may be seen by the eye, the lack of backbraking labor, the coal being delivered to the boiler by a system of fans, the absence of ash in its use, the ability to burn the cheapest kind of coal including Western lignite as well as the higher priced grade of coal. When the furnace is shut down all that is done is to turn a valve and there is absolutely no ash or refuse left in the furnace. Fires do not have to be banked as with a little kindling a fresh fire can be started in a moment. Discussion by the members followed his paper.

"Groundwood—The Three-Pocket Small Grinder as against the Magazine type" was discussed by F. W. Roberts of Lockport, N. Y. General discussion followed his paper also and considerable dissension was shown in the talks of the members in favor and against the two types. W. J. Argy, secretary of the division, of the St. Regis Paper Co., Black River, spoke in favor of the magazine type. One member argued against it from the viewpoint of, "Does its much greater cost equal the benefits it produces."

The Next Meeting

Following the final discussion of Mr. Robert's paper the subject of the next meeting place of the members was brought to the attention of the meeting by Chairman Stafford. He said that a joint meeting with the Connecticut Valley division which is the youngest, has the most members and is one of the strongest, had been suggested for early next spring at Albany, a central point for the members of both divisions. It would possibly be a two day meeting. Inasmuch as the national meeting comes in Dayton, Ohio, May 23, one member thought this joint meeting would come too close to the national meeting which he said, all the members who can possibly attend should make this day a holiday and take their families to the meeting.

He suggested a meeting of the division earlier in the fall and again urged all members possible to attend the national convention. At the last convention in Springfield, members from all over United States and Canada were present and delegates attended from several foreign countries. He suggested Niagara Falls, as an ideal meeting place for the fall session and made a motion that at the discretion of the officers, the meeting was to be held at Niagara Falls, the time and place to be fixed by the officers. Mr. Stafford put the motion to the members who unanimously accepted it.

The chairman told the members of the enjoyment to be expected at the evening banquet, the speakers, and other interesting features of the banquet. He also thanked the management of the local mills for the courtesy shown the visiting members in their trip of inspection and mentioned the quality of the paper made here in the fact that he was not even able to pick up a scrap of broken paper to take home and compare notes. He said that this could not be equaled anywhere and mentioned several other mechanisms in the local mill which proved of interest to him and the other members.

At the close of the meeting the chairman urged all eligible for membership to come forward and sign the application blanks to make a 100 percent total. A large number did so at the close of the meeting.

Dr. H. P. Baker, of New York City, executive secretary of the American Paper and Pulp Association, delivered the main address at the evening banquet, his subject being, "The Paper Industry and the Conservation of Forests in the East."

Doctor Baker said in part:

"The paper manufacturer has been charged all too often with devastating the forests. I want to point out just casually what we are taking from the forests and just what forestry and handling of our forests is going to mean as time passes.

"It was somewhat of a surprise to me that you voted as you did on Nov. 6, on this Ferris amendment and that it was treated just as you treated it. I expected it would fail as there were so many against it, I was a little surprised that this northern country should go against it, not that I am arguing for the Ferris amendment which would allow the use of 3 percent more of the Adirondacks for the timber. What I am surprised about is that this question was not decided upon facts, upon what it might mean to the future business of this state, but was decided upon sentiment influenced by men who are not interested in the business developments of this state but who have camps in the Adirondacks. Why is it that our people are so very careful in having better forests and what does it mean to us? Why do we have to be stirred up before we will give serious consideration to the proposition?

"We have had so much forest; wood has been too cheap to practice forestry and through the years we have been interested in forests in a sentimental way. We are getting away from that attitude and becoming interested in the economical value of our forests. The cost of wood is no longer at a point above production. Today with wood pulp selling at the price it is, with lumber what it is, the cost of wood is under the cost of production. When that stage is reached, we can afford to grow wood. We are going to grow wood and grow it in tremendous quantities.

Time to Abandon Sentiment

"I say, sentiment has controlled us too long in our attitude toward the forest land in this state. I said in Syracuse and I say it now, I have no patience with the policy that allows you to lock up two million acres and keep it idle and non-productive. I know that we can take these two million acres and we can get a direct return from the forests. I know that we can so handle these forests as to give us the necessary return and we can have a better recreation place. In Europe they are making their forests so productive that they are turning their agricultural lands into forests. They have more game in those forests than we have in this northern country. It is absurd.

"Do you know that the northern section of the United States has better forests than any section in Europe? We can do something in handling these forests lands of ours. Our virgin forests have never been productive. However, they give us wealth. We are going to grow forest lands again in this state, better than ever grown before. There are two or three dangerous factors to be removed before we can afford to practice forestry. We must protect our forests from fire. We are burning over seven million acres of wood land in this country, more acres than we are getting for our lumber and pulp. We have burned more wood and forests than we have used in the development of this nation. We have to stop the forest fires.

"Another factor which must be changed is the matter of forest taxation. Forest land has been wrongly taxed in this country. You do not tax the growing of agricultural products. We have got to change the method of taxing the forests, so with the low land tax, thus taxing the forest when it is removed. Wrong method of taxation has destroyed more timber in this country than has been used in the manufacture of paper. You can tax the forest and be fair. We have devastated too extensively. We have treated our forests so carelessly and have allowed them to burn so that today we have 81 million acres so badly burned and devastated that they will not go back to another forest.

"Our friends across the line have threatened us with an embargo. We have had one for some time and we have gotten along fairly well. Now, the Dominion government, a little hard up, threatens to put an embargo on wood from their lands. It will probably bring them some income. We have a sovereign state in this great union of ours which is putting an embargo on coal, the state is Pennsylvania. The situation is not so serious after all because we are learning how to use the southern woods. We are learning to use hard wood and we have lots.

"If the embargo is put upon us, we are gaing to more quickly utilize these lands of ours. I am going to live in New York and you are too, to see these 8, 9 or 10 million acres of idle forest land in New York again covered with productive forests. What a state it will be to live in with the forests going to our doors as it was in the beginning! We are going to bring back wood using industries and commodities. New York is going to be a much better state to live in after we have covered again our idle forest lands. It is going to be cheaper land and it is going to give us a larger return on the investment. I am convinced that we are at the beginning of a tremendous development in the use of our forest lands and in the use of our forests. We have got to fortify our industries with the forests if it is to be permanent in this country.

"In Scandinavia, every paper mill has a forest back of it and they are permanent. We have not developed a sense of permanency in our industry as we must develop.

"We are beginning to appreciate the fact that we will not be strong until there is a forest back of every mill, a productive forest that is going to make New York a great forest state."

Those in Attendance

Those present were:

Robert G. Argy, Cliff Paper Co., Niagara Fills, N. Y., Delbert Martin, Diana Paper Co., Harrisville, N. Y., F. W. Mullen, W. C. Stebbins Co., Inc., Watertown, N. Y., B. J. Flynn, Diana Paper Co., Harrisville, N. Y., N. J. Argy, Cliff Paper Co., Niagara Falls, John Authen, Diana Paper Co., Harrisville, N. Y., Joseph Bell, St. Regis Paper Co., Norfolk, N. Y., E. G. Eggleston, Champion Paper Co., Carthage, N. Y., H. P. Cadwell, North Country Coal and Supply Co., E. G. Eddy, North Country Coal & Supply Co., Milton J. Maquire, Empire Size and Chemical Corp., H. E. Rockwood, Champion Paper Co., Carthage, N. Y., J. R. Van Amber, North Country Coal and Supply Co., Chas. H. Plantz, St. Regis Paper Co., C. T. Wright, Champion Paper Co., Carthage, N. Y., B. J. Forestry in the Paper Industry

Conducted by J. R. Simmons, Secretary Forester,
The New York State Forestry Association

Conservation From A New Angle

R. S. Kellogg, secretary of the News Print Service, speaking at the New York State College of Forestry Nov. 12, introduced the subject of paper conservation from a distinctly new angle. He says:

"It is unfortunate that thousands of tons of white paper and millions of good spruce trees are yearly employed in spreading misinformation, prejudice and scandal. There is little basis for controversy when all the facts are known on any subject. We are only beginning seriously to consider the fundamental problem of human relations of how men should live and work together, of how they should conduct themselves if the complex that we call modern civilization is to endure. There are no short cuts to wealth and happiness that are substantial.

"A man has the right to work for whoever he chooses and to hire whoever he chooses. Employes and employers have a right to organize for the promotion of their respective interests, but neither has the right to use power to the injury of the public. The closed shop, union or non-union is ethically wrong, and the flat union scale economically unsound. The only just payment for labor is based upon quantity and quality of product.

"There is no such thing as men being created equal except in the spread eagle speech of the Fourth of July orator. The inalienable right is that of opportunity. Never will there be equality of accomplishment and reward, socialists' theory notwithstanding. Sound progress will not come from crusades inspired by ignorance and fanaticism. Bolshevism and Ku Kluxism are present examples of 'wolf trees' in the social forest with which the world has always been cursed."

How Much Does Reforestation Cost?

The problem of the cost of reforestation is one which constantly comes up in discussions of the etxent to which the paper industry can practice forestry. Some interesting figures have been secured, and the belief is growing that reforestation alone is not a solution, but that forest management in all its phases is the sure course to perpetual supply. Too long a delay after cutting in taking care of the cut over land increases the reforestation cost, even where artificial planting is necessary.

Carl Riordon of the Riordon Pulp and Paper Company, speaking some time ago at Miami, Ohio, said that the remedy for the exhaustion of the timberland supplies of the United States and Canada will be planting, "or whatever husbandry will make every acre that is unfit for agriculture yield the greatest possible harvest of wood." He went on to say that, in his opinion, reforestation for pulp and paper companies could not be considered at present a sound investment. The paper industry, however, will to a constantly increasing extent practice forestry on its holdings, as the present resources are depleted.

Data on reforestation costs for the spring of 1923 are available from the American Paper and Pulp Association, Woodlands section. W. G. Hastings, commissioner of forestry of Vermont placed the cost of forest plantations of small magnitude at $16.50 per acre, divided as follows: Trees, $8.40; labor, $6.00; freight and drayage, $.60; overhead expenses, $1.50; On a large scade he believes these figures would be cut 25 per cent. Philip W. Ayres, secretary of the Association for Protection of New Hampshire Forests, places the cost of white pine planting at $15 to $20 per acre.

Harris A. Reynolds, secretary of the Massachusetts Forestry Association, places his estimate at $15 per acre for white pine, while a trained crew would plant at $10 per acre. H. O. Cook, chief forester for Massachusetts, puts the cost of planting 3 year old transplants at $15, of which $7 is for the planting stock and a similar amount for labor. Costs on lots of 20,000 or more trees would be shaded 5 to 10 per cent. J. W. Toumey of Yale puts the cost at from $12 to $24, according to the use of seedlings or transplants. The Connecticut figures range from $12 to $13.20 per acre.

In New York, the forest schools at Syracuse and Cornell give estimates ranging from $15 to $17 per acre. The Forestry Association in New York State made a number of plantings for municipalities where the cost figures were very low, but where hired crews were engaged, the cost was $22 per acre for transplants and $13.75 for seedlings.

New Jersey figures run from $10 to $12 per acre, Pennsylvania from $11 to $12, and Maryland as high as $28.68 per acre. A paper company forester in Ohio, Karl A. Swenning of the Mead Co., Chillicothe, O., planted cottonwood and maple at a little under $14 per acre, this being a 1921 planting.

These figures all tend toward the conclusion that planting stock must be provided at low cost, either from company nurseries, where the area to be reclaimed is extensive, or from State nurseries at cost of production. Still more important is the matter of forest taxation. Reforestation at the average cost of $15 per acre will increase rapidly among all far-sighted timberland owners whose land is situated in the states where the law exempts planted forest growth until time of harvest.

Urge Definite Forest Policy

At its eighteenth annual meeting, held at Utica, N. Y., Nov. 8, the Empire State Forest Products Association adopted the following resolutions:

1. The resolutions of the previous convention, held on November 9, 1922, regarding State and National forest policies are re-affirmed and it is with satisfaction that we note the steadily increasing acceptance of the basic principle of Federal leadership and co-operation with the states and timberland owners in all important forestry proposals before the country. This denotes sound progress of the most encouraging sort.

2. The time has now arrived when the formulation of an adequate policy covering the management and use of all the forest resources of the State of New York can no longer be delayed. We know the basic facts required and the permanent welfare of ten million people demands that the forest lands of the State of whatever status of ownership, as rapidly as possible be placed in condition to yield the maximum permanent annual return in timber, watershed protection, recreation, and fish and game. These objects are not conflicting; they constitute the harmonious economic development of the tration of the public forests of the Nation.
resources of the forest as is abundantly proved by adminis-

3. We believe that the Empire State Forest Products Association including, as it does, within its membership representative timberland owners, manufacturers of forest products and

foresters of wide training and experience, is eminently qualified to take the lead in the formulation of the principles upon which an adequate and permanent State forest policy must be based and we recommend to the board of directors that this be made the major activity of the association for the ensuing year.

4. We also recommend that the association solicit the active co-operation and assistance of all other organizations and individuals in the State, who, in the interest of the public welfare, are willing to help work out this problem along the lines herein specified.

To Americanize The Chinese Chestnut

Forestry specialists are investigating two Chinese chestnuts, Messrs. *C. molissima* and *C. vilmoriana*, and others of their brothers and cousins primarily to find a species that will be a fitting substitute for the American species and at the same time resist successfully the chestnut blight which is now sweeping through the South Atlantic States and threatening to destroy utterly the American chestnut.

While chestnut lumber does not especially interest the manufacturers of paper or the producers of pulpwood, the complete loss over a wide area of any good lumber tree can not fail to have its effect upon industry. In Massachusetts, before the chestnut bark disease took its heavy toll, one tree in every six was a chestnut. In many other eastern states readjustments in the use of species have become necessary as a result of the disease.

The experiments in question are being conducted at the Department of Agriculture's experimental farm near Washington, D. C., and also at the Appalachian Forest Experiment Station at Asheville, N. C., while in China an explorer sent out by the office of foreign seed and plant introduction of the Department of Agriculture is searching the Himalaya uplands for new species and varieties of chestnut and closely related genera for further research work in this country.

The Indian chestnut (C. diversifolia), a large evergreen from the mountains of Bengal, stands in equal favor with the Chinese species, and a Japanese species has been found which possesses good blight-resisting qualities. Our native chinquapin has also entered into the tests, which include cross-breeding as well as blight exposure and various climatic ordeals. The work must go on for some time before a definite decision can be published. Two small plantings have been made on the Natural Bridge National Forest and two on the Florida National Forest.

Commends Chamber of Commerce Forestry Report

Col. Henry S. Graves, former chief forester and now head of the Yale Forest School and president of the American Forestry Association, in a letter to five hundred local chambers of commerce commends the report of the national chamber's committee on forestry. He, however, calls attention to the fact that certain recommendations of the committee, if applied literally, would restrict the federal government in its present work of purchasing forest areas in the east under the Weeks law.

"One of the recommendations of the committee is to the effect that the government should, under existing law, acquire and replant our waste lands on which reproduction of forests cannot be obtained by natural means. This recommendation interpreted literally would restrict the government in its Weeks law purchases to the acquirement of land on which there is no timber growing at the present time, and which would have to be reforested by planting or seeding.

"The purchase of forest lands by the government for the building up of national forests in the east must not be confined exclusively to waste areas. The operation of the present Weeks law during the last ten years has proved conclusively that it is desirable and essential for the federal government to acquire lands covered with standing timber even though it is young and immature forest growth.

"The wisdom of this policy is clearly demonstrated by the areas which the government has been acquiring as national forests in the White mountains and the southern Appalachians. If the committee's recommendation is construed to restrict the government to the purchase of waste lands only, its operative effect would be a serious blow to the federal government's present program of acquiring public forests in the east."

Forests of Colorado

State Forester W. J. Morrill has just completed a statement relative to the forests of Colorado. His figures show that the standing timber is worth $60,000,000, that one-fourth is privately owned, the national forests containing 75 per cent.

In the national forests there are 18,076,432,000 board feet of timber, and on this basis the entire amount is conservatively estimated at 24,000,000,000 board feet. The value is based upon an average price of $2.50 a thousand feet.

The average annual loss during the last five years has been .035 per cent of the valuation within the national forest. Outside it has been a little higher. The fire loss average in the national forest was $21,321 a year, while outside it was $5,280 a year.

New Chief Forester For Nova Scotia

O. Shierbeck, formerly chief forester for Price Brothers of Quebec, has resigned to become chief forester for the province of Nova Scotia, to conduct a study of forest conditions and possibilities in that province.

A forest nursery will be started at Annapolis Royal for the benefit of farmers and land owners as a demonstration area.

Mr. Shierbeck has spent the last four years on the pulpwood operations of Price Brothers and his service in Nova Scotia will be financed by Frank J. D. Barnjum, who offered to maintain this department when the province failed to establish such a department at its own expense.

Experiments In Slash Disposal

A series of experiments in the Bend, Oregon, region by the Shevlin-Hixon Company has produced some interesting data as to the possibilities of reproduction of timber on cut over western lands.

The company experimented on burning in strips, totaling not over 400 acres, and the unburned area is showing a good sized stand of young trees of various sizes, while on the burned strips there is an absolute absence of seedlings.

Forestry in Louisiana

There is now under state forestry supervision in Louisiana about 145,000 acres of land owned by paper and lumber companies, and an additional tract of 55,000 acres is under observation. In all cases the forestry work is being done by co-operative effort between the state and private interests.

Oregon has fifteen federal forest reserves and the forest area of this year is given as 13,137,447 acres. The secretary of state has apportioned $168,111.95 to the various counties sharing in the fund secured from forest reserve rentals, sale of timber and other resources from forest reserves within the state of Oregon for the year ending June 30, 1923. Of this money 75 percent goes to the road fund and 25 percent to the school fund.

Vol. XXXIII November 29, 1923 No. 6

What Is Waste?

IT is popularly but erroneously supposed that half of the wood used in the manufacture of sulphite pulp is lost. Some editorial writers, ourselves among the number, have aided in the dissemination of misleading information of this kind during early days of contact with the industry, but a better knowledge obtained by closer study of materials and processes has operated to clear up doubtful points and correct some misconceptions of what really constitutes waste.

In the paper by Professor McKee of Columbia University, on the utilization of sulphite waste liquor, which was read before the American section of the Societe de Chemie Industrielle on October 12, and published in PAPER for November 1, 1923, the statement is made that "in the making of sulphite pulp about 50 percent of the wood is dissolved by the cooking liquor and discarded as waste into the river." Discussing the paper Professor Doremus reiterated the statement that wasteful methods prevailed in pulp manufacture as evidenced by the loss of 50 percent of the raw material which was washed away, to the consequent pollution of streams and watercourses, for the lack of some method of recovering by-products of the spent liquor.

This alleged waste of "50 percent of the wood," so constantly talked about, does not in fact exist, and it is not helping the industry at all to put out statements of this kind about tremendous waste when there really is no such waste.

It is true that there is a shrinkage in making sulphite pulp from wood, but if the steps in the process are traced from tree to pulp it will be found that there is no waste such as might be implied in a failure to apply a material to some useful purpose.

In the woods there is extremely little of the tree that is not used. When a tree is cut to a two-inch top as it is in many places, and to four inches in most, not much can be said about waste in the woods. After the wood reaches the mill the bark is removed, amounting to 11 percent, approximately, which leaves 89 percent. From this must be deducted about 2 percent of the gross wood for sawdust, leaving 87 percent as chips to be cooked. There is in spruce about 48 percent of cellulose and in cooking sulphite pulp commercially the efficiency of conversion is about 45 percent of the weight of the wood, based on dry weight. The net result of cooking is a further shrinkage of 47.85 percent, making a total shrinkage of 60.85 percent.

An analysis of the shrinkage will reveal no true waste. If the bark and sawdust are used as fuel it certainly is not waste and if there is no known profitable method for using the dissolved woody substance in the waste liquor it is not waste to dispose of it in the least expensive way. Pulp manufacturers are not in the business to trade dollars with themselves and that is about the best that can be said for most of the schemes to utilize waste sulphite liquor.

Zeolite Patent Is Void

A decision recently handed down from the bench in the United States district court, Detroit, declares the patent of the Permutit Company of New York, on their zeolite water softening system, absolutely void.

The case is one of the most important patent suits in recent years, and is of particular interest to the readers of PAPER. Suit was brought by the Permutit Company to restrain the Weyne Tank & Pump Company, of Fort Wayne, Ind., patent infringement being claimed.

The Wayne Tank & Pump Company manufactures both domestic and industrial water softening systems, many of the latter having been supplied to the papermaking field.

Judge Arthur J. Tuttle, who devoted nine days to the hearing, was aided by his knowledge of the German language. Much of the testimony was given by witnesses brought from Germany by both plaintiff and defendant.

Judge Tuttle declared in his decision that August Neumann, a civil engineer and filter manufacturer of Reppen, Germany, and the star witness for the defendant, had originated the first commercially successful zeolite water softener.

He further held that "the patent in suit is no more entitled to the credit for the porperty possessed by zeolites than a man is entitled to credit for making water run down hill, or entitled to a patent on gravity. It is at natural property known to the world, known to the art (of water softening), prior to the time of the patent in suit."

The Scientific and Industrial Research Council of Canada has for some time been interested in the making of paper from the huge straw piles of the vast prairie provinces. From experiments conducted the practicability of this being done was apparently established, though much remained to be accomplished in this respect. The experiments are to be speeded up, for if they are fully successful it would mean a new and great source of wealth to the West.

New Developments in Paper Making

Cellulose for Paper Making

The chopped up stalks and leaves of lupines and shells and pods of beans and peas are digested with two percent sodium hydroxide solution under a pressure which varies from two to three atmospheres. They are then treated with a four to six percent solution of bleaching powder and with a solution of sodium bicarbonate.

The fibers obtained are very fine and durable and are suited for the manufacture of papers of the highest quality. This process is patented in German patent No. 375,034.

* * *

Purifying Sulphite Cellulose Waste

Concentrated sulphite lye is sprayed into furnaces or against heated walls by means of nozzles. In this way the noxious materials obtained from and in sulphite cellulose waste lyes are burned.

The air used in spraying the lye or that supplied to the furnace or combustion chamber, or both, is preheated. In this way exaporation of the water begins at the moment of spraying and the sulphite lye is completely burned. This process is patented in German patent No. 375,036.

* * *

Paper With Leather-Like Finish

German patent No. 379,471 is concerned with a process for making a paper with a leather-like finish. The process consists in taking a sheet of tissue paper or other thin paper and squeezing it together in a small ball, after which the ball is smoothed out again. The sheet of paper is then placed on a flat, dry paper undersurface and sprayed with a varnish or resinous adhesive mass.

Shortly after the paper is sprayed or painted with this composition, the latter penetrates through the thin sheet so that the adhesive serves to fasten together the top sheet of thin paper to the paper undersurface. The surface is then brushed and given the appearance of leather.

* * *

Cellulose Determination

The lignin of wood is dissolved by heating with dry phenol, but the reaction is rapid and complete only in the presence of traces of mineral acids or dissociable acid salts. This reaction can be utilized for the quantitative estimation of resistent cellulose provided the hydrolysis of the carbohydrates is controlled by careful regulation of the concentration of the acid and time and temperature of heating.

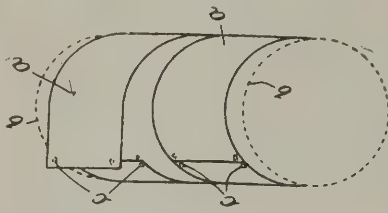
The finely rasped wood material is passed through a sieve with one hundred meshes per square centimeter and extracted with water and acetone, then dried in the oven. Four grams of the material are treated in a tube 18 by 3 centimeters, with 50 grams of dry phenol containing 0.1 percent of its weight of hydrochloric acid, and heated in a water-bath at a temperature of 97 degrees C. for one hour, with occasional stirring. Under these conditions constant yields are obtained but the more readily hydrolyzable hemicellulose and pentosans are attacked and dissolved, so that the yield of cellulose from spruce wood is 48.3 percent and from beech wood 46.4 percent.

The same method may be used for the determination of resistant cellulose in sulphite pulp and cotton, for which materials the concentration of the hydrochloric acid should be reduced to 0.05 percent. The results may be corrected from the quantity of the pentosans remaining in the crude cellulose. The values that are obtained by this method, while constant under specified conditions, have no direct relation to any absolute standard and stand between those found by Cross and Bevan's method, where a minimum attack on the hemicellulose is aimed at, and those found by Koenig's method, where the maximum elimination of the hydrolyzable carbohydrates is ensured. For further details see Cellulosechemic, 1923, pages 37 to 40.

* * *

Dandy Rolls

British patent No. 202,196 describes the construction of an ingenious dandy roll. The watermark carrier is detachable and can be fastened by its back to the surface roll. The illustration shows the construction of the roll.



The improved device consists of a strap of wire gauze carrying the watermark device. This can be wrapped around the surface of the dandy roll so that the edges of the gauze just meet but do not overlap. The back or underside of the meeting edges of the strap and the surface of the dandy roll are provided with corresponding press button fastenings c, equivalent two part fastenings, whereby the strap carrying the watermark is detachably and interchangeably secured in place upon the surface of the roll b.

In some cases the surface of the roll may be suitably recessed where the press buttons or the parts carrying them are located.

* * *

Washing Paper Machine Felts

British patent No. 201,728 is concerned with a process and apparatus for washing paper machine felts. The invention relates to a process which comprises successively treating the same portion of the felt with a washing solution, with steam under pressure, and with air under pressure.

It also relates to a process in which the treatments are applied to one side of the felt in combination with additionally treating the opposite side of the felt by applying suction to it. In this process the treatments are applied to the back of the felt in combination with treating the front of the paper carrying-surface of the felt by suction. The back of the felt may also be successively treated with a hot cleaning solution, a cold rinsing water, with steam under pressure and with air under pressure and exposing the surface of the felt to suction simultaneously with steam and air treatments.

The process includes the suction treatment continued longest, the air treatment next longest, and the cleaning solution treatment shortest in point of time. The apparatus for cleaning paper machine felts comprises a suction box disposed for engagement with the face of the felt, means for directing washing fluids against the back of the felt at a point adjacent to the suction box and means for directing steam under pressure and air under pressure against the back of the felt at a point in contact with the suction box. The apparatus may also consist of a suction box which comprises a pair of independent suction chambers disposed for engagement with the face of a felt, the steam and air supplies, each being in contact with one of the said suction chambers. In another form of apparatus the suction box is moved towards and away from the felt by means of cams.

A. P. W. Co. Will Have Canadian Pulpmill

The first sulphite mill to be erected in Nova Scotia will be that which the Albany Perforated Wrapping Company will construct at Sheet Harbor, next Spring.

It is reported that the mill will have a capacity for 25,000 cords of pulpwood per year and will employ about seventy-five men in the mill and 200 in the woods. The initial expenditure will be in the neighborhood of $250,000.

The A. P. W. Co., has purchased the property of the Sheet Harbor Lumber Company, formerly Rhodes and Curry. The contract for electrical power to the amount of 21,042,600 kilowatt hours has been signed by the chairman of the royal power commission. The contract is for 30 years.

The contract with the power commission provides that the company is to commence work on the plant before May 1, 1924, and complete the mill within fifteen months. It is also stipulated that the company is to expend not less than $100,000 for machinery and equipment.

R. E. Jones, the representative of the A. P. W. Co., who has been in Halifax for some time negotiating the contract and making the preliminary arrangements for the new enterprise, is to be the resident manager of the new mill.

Sheet Harbor affords excellent deep water shipping facilities and the product of the pulp mill will be shipped direct from there.

The project will be financed entirely by the A. P. W. Co., one of the largest concerns of its kind in the United States. It was established in 1877 and its factories at Albany, have a capacity of eight tons per day.

Makes New Western Connections

Chain Belt Company, Milwaukee, manufacturers of rex chain, transmission machinery and conveying equipment, formerly represented on the Pacific Coast by Meese & Gottfried Company, San Francisco, has established direct factory branches and warehouses in Portland and Seattle. Arrangements have also been made in important centers throughout the Pacific northwest for the prompt handling of local requirements.

The northwest territory, with headquarters at Portland, will be in charge of Allen C. Sullivan, M. E., a graduate of the University of Washington. Mr. Sullivan was formerly connected with the Allis-Chalmers Co., of Milwaukee and more recently with Smith & Watson Iron Works of Portland, as chief engineer.

Don B. Catton, formerly with Meese & Gottfried Co., and later engaged in the machinery supply business on his own account will be the special sales representative for the Portland office. The Seattle and British Columbia territory will be handled by Wm. F. Nichols out of the Seattle office. Mr. Nichols for the past 11 years has been connected with the Meese & Gottfried Company and is considered one of the best posted chain men in the Pacific Northwest.

The Portland office of the Chain Belt Company is located at 67-69 First Street, Portland, Ore., and the Seattle office at 1040 Sixth Avenue, South, Seattle, Wash. Large stocks are maintained at both places.

Rosebush Talks to Rotarians

Judson G. Rosebush, treasurer and general manager of the Northern Paper Mills Co., Green Bay, Wisconsin, gave a very interesting talks before the Rotary Club of Wisconsin Rapids, on November 14th. The subject of his talk was the scope and activity of the Y. M. C. A. in which he has been interested for many years and was a delegate to the recent constitutional convention of the organization held at Cleveland, Ohio, at which a new constitution to be submitted to local units throughout the world for approval was adopted Mr. Rosebush is also international president.

After outlining the proposed constitutional changes Mr. Rosebush discussed the interest taken by the Y. M. C. A. in activities overseas and as an extreme example of the scope of the work cited the fact that the organization lost $1,000,000 in property in the Japanese earthquake.

He characterized the Y. M. C. A. as an important factor in spreading Anglo-Saxon ideals throughout the world.

Mr. Rosebush, in addition to his connection with the Northern Mills, is president of the Patten Paper Company of Appleton, and vice president of the Nekoosa Edwards Paper Co., at Nekoosa and Port Edwards, Wisconsin.

In the plants of the Nekoosa Edwards Paper Company, Port Edwards, Wisconsin, there has been conducted a strenuous no-accident campaign for some time. Both the Nekoosa and Port Edwards mills are fighting for possession of the trophy, a bronze tablet, which will be presented at the end of the year to the mill having the least accidents for the 365 days. The Nekoosa mill has a slight wedge on Port Edwards so far.

The Brown Paper Mill Co., Inc., which is erecting a paper mill at Monroe, La., is beginning the steel construction and the plans are laid for the plant to be completed and ready for operation by June 1, 1924.

David C. Mahoney and Charles F. Hicks have purchased the building and business of the Colonial Paper Box Co., at 385 Harrison Avenue, Boston.

St. Regis Using Electric Grinders

Taking advantage of the increased flow of Black river as a result of the recent heavy rain, the St. Regis Paper company at Deferiet, N. Y., threw into operation its new electric pulp grinders. Corwin T. Jewell, assistant general manager of the St. Regis mills said that the results of the test were extremely gratifying, although he could give no exact figures on production thus far obtained from the new grinders.

The electric grinders, numbering eight, are installed in a building across the tail race of the development at Deferiet, about 500 feet from the building housing the paper machines. Their capacity when fully running is expected to be about 75 tons of pulp every 24 hours. The 20 water grinders of the St. Regis plant at Deferiet are capable of turning out 160 tons of pulp daily under normal water conditions, so that the total pulp-grinding capacity of the mill, with proper water flow, will be in the neighborhood of 235 tons a day.

Ground pulp can be run from the new grinding establishment directly to the newsprint mill by gravity, thus effecting a considerable saving both in time and money.

During the low water period ended by last week's rains, the Deferiet plant of the St. Regis was grinding only 30 tons of pulp a day, against a normal low-water output of 70 tons. Purchase of large quantities of graundwood fram Canada was thus made necessary.

Mr. Jewell said that every effort would be made now to operate the full battery of grinders of the St. Regis at capacity in the hope of storing up sufficient pulp to carry the mill through the winter. More electric grinders will be added from time to time, Mr. Jewell said.

It is believed that eventually all water grinders at the Deferiet mill will be replaced by electric grinders, owing to greater production capacity and sureness of operation.

The production of the St. Regis at Deferiet is around 180 tons of newsprint a day, with a record of more than 188 tons.

A group of seventy-five students of the Economics department of Kalamazoo college went thru the plants of the Kalamazoo Paper Co. Wednesday October the 24th. F. M. Hodge furnished guides to take them through.

Promotions at Nepco

With the installation of two new paper machines and other necessary equipment at the two plants of the Nekoosa Edwards Paper company several promotions have been made.

There has been created at the Port Edwards mills, of which there are now three, a department of maintenance. This department will have the entire care and repair of all machinery, roofs, buildings, dams, etc., and this new department will include millrights, pipefitters, machine shop construction and reclaiming.

In line with the company policy John E. Walley, a man who has been doing work along these lines for the past six years, was promoted to the place of superintendent of maintenance with the same relationship toward the officers as the other superintendents. Prior to his promotion Mr. Walley has been in the employ of Nepco as head of the construction department and has completed a number of large jobs during that time, the last being the construction of a new mill and two paper machines.

The installation of two machines means three boss machine tenders, six machine tenders and six back tenders in addition to the regular crew. Men who have served the company longest have been promoted from machine tender to boss machine tender, back tenders to machine tenders and third hands to back tenders. There have also been several other promotions to positions of shipping and finishing room foreman, shipping clerks, beater engineers, etc.

C. E. Trelevan who for a number of years has been shipping room foreman at Nekoosa has been promoted to the position of "order scheduling and shipping" at all the mills of Nepco. The increased production of the plants makes it necessary to have a man who knows all of Nepco's products in order to get the best possible delivery date for their customers.

Nepco mills, as now equipped, make nearly every grade of wrapping paper known to the trade and with 8 machines, 200 tons per day production are supplying the whole line to wrapping paper houses in many states.

Finland's August Paper and Pulp Exports

Manufacturers state that the paper market in Finland is still quiet and marked by low prices, the demand for both newsprint and wrapping paper being very dull, reports Consul Leslie A. Davis of Helsingfors, to the U. S. Department of Commerce.

Paper exports were less in August than in July, and considerably less than in August, 1922, the volume for the month, according to official statistics, amounting to only 12,969 metric tons, compared with 15,309 during July and 17,452 tons during August, 1922. The total exports of paper during the first eight months of 1923 have amounted to 116,234 tons, a loss of 9,516 tons compared with a similar period during 1922.

The mechanical ground-wood market has also been rather dull during the past month or two, and exports of both pulp and cardboard in August were considerably under those in July and in August, 1922. Exports during August, 1923, amounted to only 8,314 tons of pulp and 1,780 tons of cardboard, although the total exports for the first eight months of 1923 were better than for the same period of 1922, shipments of pulp reaching 44,665 tons and exports of cardboard totaling 16,374 tons, compared with 41,500 tons and 14,919 tons, respectively, during 1922.

There has been little change in the chemical woodpulp market during the past month. Exports of this product, which amounted to 15,958 tons during August, were less than during July, and it is said that not many sales have been made during the summer, although inquiries have increased recently. Prices remain the same as they have been. The total exports of chemical wood pulp during the first eight months of this year amounted to 141,568 metric tons, of which 104,561 tons were sulphite and 37,007 tons sulphate. Exports for the similar period of 1922 amounted to 117,378 tons, of which 82,335 were sulphite and 35,043 tons sulphate.

Make Survey of River Pollution

E. J. Tuley, chemical engineer of the State Board of Health, is making a survey of the Wisconsin river between Rhinelander and Nekoosa for the purpose of investigating the alleged pollution of the stream.

At each of the principal river valley cities Mr. Tully meets the local conservation warden, who arranges for boats and cars. Rhinelander, Tomahawk, Merrill, Wausau, Stevens Point, Wisconsin Rapids and Nekoosa are the points at which samples of water are being taken.

While the project is being carried out by the State Board of Health, the investigation into river water conditions has the cooperation of the conservation commission and sportsmen in hope that better conditions for fishing will result.

An involuntary petition in bankruptcy has been filed at the office of the referee at Augusta, Me., against the Agusta Paper Co., of Augusta, and asking that a trustee of the concern be appointed. Most of the creditors of the company are Boston concerns.

To Overcome Housing Shortage

Building permits issued in Vancouver, Washington, for the month of October, 1923, totaled $298,530 as against $3585 for the corresponding month of 1922.

Deducting the $285,000 permit for the saw mill and main paper mill of the Columbia River Paper Mills Corporation the amount of the permits left is nearly four times the $3585 building permits issued last year; yet the real estate men report that every desirable house in the city is occupied.

The new industries located in Vancouver are responsible for the greater portion of this house shortage although so far most of their work has been that of building the plants.

The paper mill is helping the Chamber of Commerce work out a plan to build moderate priced houses to be sold on the installment plan to employes of the industries.

Testing a Snow Motor

The projected field demonstration in the snow covered forests of the north woods by the Woodlands section of the American Paper and Pulp Association of a snow motor is resulting in many calls from northern pulp mills and motion picture houses catering to paper mill communities for the motion picture film showing the snow motor in action.

The pictures were taken last year in the west, and are being shown so that practical woodsmen can devise in advance some difficult tests to put this machine to when the demonstration is held in mid-winter.

The film is already scheduled for showings in Carthage, Au Sable Forks, N. Y., as well as Sheldon Springs, Vt., and Austin, Pa.

Doings in Canadian Paper Field

No Rise in Newsprint Price Expected

Newsprint production in Canada during October increased by 11.7 per cent over that for September and stood at 114,475 tons, or only 250 tons below the high record set up in August. During the first ten months of 1923 the newsprint production was 1,059,295 tons as compared with 896,840 for the same period in 1922, an increase of 18 per cent; during this time the United States production increased by only 4 per cent.

It is not expected that there will be an increase in newsprint prices at the first of the new year. As a matter of fact, though the increasing cost of labor is bound to increase the cost of getting out wood and thus boost the cost of production generally, still there is an impression that possibly the market may be weakening a little, for which reason it would be better to pocket any loss occasioned through higher productions costs rather than to run risk of weakening the demand through higher prices.

There are indications also that the value of the Canadian dollar in New York is bound to be affected by the fall in sterling, while the drop in grain prices, even though the volume of exports remains the same, is bound to reduce the favorable balance of trade in favor of Canada, and thus reduce the value of the Canadian dollar.

Now this would be a gain, rather than a loss, to Canadian mills selling in the United States, for in proportion as exchange goes against the country to that extent would they benefit through the enhanced value of American funds in which they receive settlement. This would enable them to meet higher production costs without increasing the price of newsprint.

St. Regis Lets Power Contract

As if reflecting the advance of the pulpwood embargo come the details of the plans of the St. Regis Paper company which has in mind the erection of an important pulp and paper enterprise in the province of Quebec to supplement its mills in Northern New York.

The Canadian Comstock company has been awarded a contract by the St. Regis Paper company for the hydro-electric development work at Godbout, Que., in connection with the wood preparing plant which the paper company has under construction at this point.

The St. Regis company realizes the necessity of becoming established in Canada and its present development work at Godbout is in connection with its program of manufacturing on this side of the border from the limit it holds in Quebec. The company proposes to build, at a later date, a pulp and paper mill to round out its production program.

Attack Christmas Tree Evil

Some of the executives of the pulp and paper companies in eastern Canada are complaining about the wholesale destruction of small fir and spruce trees in the eastern provinces of New Brunswick, Nova Scotia, Prince Edward Island and Quebec.

The gatherers of Christmas trees are now at work cutting the young trees. Following the holiday, these little trees will be tossed into the discard; whereas had they been permitted to grow, the trees would have increased the pulpwood supply greatly in the course of a few years.

Of recent years the number of little trees cut down in the eastern provinces for the Christmas season has been beyond all reason and the volume is growing heavier each year. This year the cutting of the young trees started early in November and large shipments are being made to all parts of Canada and Newfoundland, to the British Empire and to the United States and the British West Indies. There should be some restriction placed on the activities of the Christmas tree gatherers. Curtailment instead of increase of the cut should prevail.

Canada in Competition with Sweden

Great possibilities for the development of the pulp and paper industry in Canada were seen by Olaf Kjellstrom, one of the leading pulp and paper manufacturers of Sweden, who was in Toronto a few days ago on his way to the Orient.

He has visited the main pulp and paper centres in Canada and the United States and will spend some time in the Orient investigating the markets there and reorganizing the company's branches in Tokio and Yokohama.

It is thirteen years since Mr. Kjellstrom visited this continent and he declares his surprise at the prosperity exhibited on all sides. "You people out here have the opportunity of developing a tremendous trade with the Orient and in Canada we are going to meet with very severe competition in the pulp and paper line," he said.

Brompton Bonds to Be Redeemed

The Brompton Pulp and Paper company has announced its intention of redeeming on Nov. 1 the balance of the issue of first mortgage sinking fund six per cent bonds maturing in 1927 at 105 and accrued interest. This issue, which was put out in 1907, orginally amounted to $1,000,000, $896,000 having been previously redeemed.

The total funded debt of the company, as shown in the last annual balance sheet, was $5,153,200, the bonds which it is planned to retire being the oldest of four issues. First consolidated sixes, due 1935, to the amount of $104,000, are held in escrow to provide for the redemption.

W. H. Sherriff, head of the Hodge-Sherriff Papee Company, Toronto, selling agents for Wayagamack kraft, has returned to Toronto after a trip through Canada to the Pacific coast. Mr. Sherriff reports a growing demand for kraft paper throughout the west although business conditions there at the moment are somewhat draggy.

The Lincoln Paper Mills Company, Limited, at Merritton, Ont., has promoted one of its staff, in the person of A. E. H. Fair, to the position of superintendent of the Lybster plant of the company. Mr. Fair's rise in the paper industry has been rapid. Graduating in chemical engineering from the University of Toronto a year and five months ago, he entered the employ of the Lincoln Mills and is now in charge of one of their chief divisions.

A. P. Costigane, secretary-engineer of the Ontario Pulp and Paper Makers' Safety Association, has returned to Toronto after a week spent in the mills of the Spanish River Pulp and Paper Mills Company at Saulte Ste. Marie, Espanola and Sturgeon Falls, Ont. As a result of consultations with the executives and men Mr. Costigane is more optimistic than ever as to the future of accident prevention in the company's mills.

The extension of the wood room of the Abitibi Power and Paper Company's plant at Iroquois Falls, Ont., has been completed. Four new barking drums have been installed and are in operation. The new upper and lower water tanks are also finished. When the eight drum barkers are at work the capacity of the plant will be double what it was. When pressed the barkers will bark as high as 2400 cords a day.

While no definite step has been taken as yet it is known that the Fort William Paper company are preparing to double the capacity of their newsprint mill at Fort William, Ont. The present capacity of the mill is 120 tons of groundwood pulp per day, and 160 tons of newsprint. If the contemplated enlargement goes on it will involve an expenditure of between $2,000,000 and $3,000,000 and will increase production to about 400 tons of newsprint daily. The plant, as it stands, represents an investment of about $4,000,000, and directly or indirectly gives employment to about 1,000 men.

According to Angus McLean, head of the Bathurst company, Bathurst, N. B., the company's new newsprint mill turned out 55 tons of newsprint a day during October. September was the first full month the machine was operating when 50 tons were produced. It is expected that production will reach 60 tons during the present month, which is considered a fairly good record.

Many Ontario paper men greeted with pleasure last week an old fellow worker in the person of J. J. Herb, head of the Westminster Paper Company in British Columbia, manufacturers of light weight papers. Mr. Herb was at one time superintendent of the Interlake Tissue Mills, Limited, at Merritton, Ont., and quite recently established a mill in New Westminster, B. C., where he says things are running smoothly.

Warwick Bros. & Rutter, Limited, a big manufacturing stationery house in Toronto, has just issued a beautifully bound and printed book containing the complete story of their business which is now just seventy-five years old. The book is a beautiful example of the printers' art and contains much interesting historical data and pictures dealing with Woodstock, Ont., where the firm was founded, and Toronto, where the company has a huge plant. Some interesting historical side-lights are thrown on both places from a commercial standpoint.

The Ontario government has recently disposed of four timber areas totalling in extent some twenty square miles. The tracts are in all cases burned over ones which require to be sold immediately if the merchantable timber is to be salvaged. The tracts are situated in the districts of Timiskaming. Rainy river, Kenora and Nipissing. The contractors paid from $1.50 to $2.20 per cord for the spruce pulp.

Tenders are being received by the Eastern Trust company of St. John, N. B., for the sale of first mortgage bonds of the Nashwaak Pulp and Paper company of St. John, sufficient with interest to exhaust the amount of seventy-eight thousand dollars new on deposit with the Eastern Trust company under the sinking fund provisions in the trust mortgage securing the bonds.

Sir William Price, president of Price Brothers company, pulp and paper manufacturers of Quebec, expresses himself as decidedly in favor of an embargo on pulpwood exportation to the United States. He says there is no surplus wood to export and asserts the Canadian Mills will not be able to secure supplies and will not operate to the fullest capacity.

The Whalen Pulp and Paper Mills are now operating at capacity, and it is understood, will show a profit on production. There does not appear to be a move just now for reorganization, especially as trade conditions have improved.

Alexander Smith Heads Abitibi

Another prominent American business man in the person of Alexander Smith of Chicago, a member of the banking firm of Peabody, Houghteling and Company of Chicago and for some time vice-president of the Abitibi Power and Paper Co., has been chosen president to succeed the late F. H. Anson. This is an assurance that the vigor, enterprise and financial support that have given Abitibi the prominent place it occupies in the Canadian pulp and paper industry will be assured to this corporation.

Other changes made in the directorate and management are as follows: W. A. Black, vice-president and managing director of the Ogilvie Milling Co., has been elected vice-president; E. L. Pease, vice-president of the Royal Bank of Canada has been added to the directorate and L. R. Wilson, for many years secretary of the company, has been appointed general manager.

L. R. Wilson was associated with the late F. H. Anson in a business capacity for 23 years, the association dating back to 1900 in the milling industry in New York state. When Mr. Anson came to Canada and entered the employ of one of the leading Canadian milling companies, Mr. Wilson went into the sugar business, and in 1912, when the Atlantic Sugar Refineries was organized, Mr. Anson induced Mr. Wilson to assume the management.

It was about this time that the Abitibi company was started, some of those prominent in Atlantic Sugar being also prominently identified with the new power and paper venture, and Mr. Wilson became the first treasurer of Abitibi. In 1917 he severed his connection with Atlantic Sugar and devoted all his time to Abitibi's affairs. His appointment to the general management has been received with very great favor.

Proof of Anson's Foresight

That the Canadian pulp and paper industry owes much to the courage and enterprise of men such as the late F. H. Anson is to be seen in the fact that when the timber limits now owned by the Abitibi Company were first put up for auction there were no buyers; indeed, they were practically peddled among the financial interests. It was thought that being so far away a mill could not be a paying proposition.

It was at that time that Mr. Anson became interested in them and in the water power possibilities, and came to the conclusion that a power and paper enterprise could be made to pay handsomely. Some called it "Anson's Folly," but he kept on with the result that is well known.

Progress of Backus-Brooks Mill

Development work in connection with the first unit of the newsprint mill of the Backus-Brooks Company, at Kenora, Ont., has progressed to a point where the company expects to have its first paper machine operating in December. The machine, as large as any in the world, is being built by the Dominion Engineering Works, Montreal.

It is the intention to build a sulphite pulp mill soon after the paper machine is in operation. At present the mill has a capacity of 80 tons of groundwood pulp, which is sufficient for 100 tons of newsprint that will be turned out by the new machine. The sulphite pulp will be shipped in until the new mill has been completed.

It is planned to add 100-ton units until the mill has a capacity of 500 tons or more of newsprint daily.

Power is being supplied by what was formerly a municipal hydro-electric plant at Kenora, and which has been brought to a point where it is capable of producing from 10,000 to 12,000 horse power.

The Backus interests also control the water power of the Norman dam, situated less than two miles from Kenora. Negotiations in regard to water levels on the Lake of the Woods, which will have an important bearing on the power capacity of the Norman dam, are proceeding between Canada and the United States. As soon as a settlement is reached Mr. Backus proposes to construct the power. The combined output of the two plants, both located on the Winnipeg river, will be sufficient to operate pulp and paper mills with a capacity of about 400 tons daily.

Talks on Forest Policy

Addressing the Ontario Associated Boards of Trade at Hamilton, Ont., Dr. Clifton D. Howe, dean of the faculty of the University of Toronto, declared that only an aggressive and sustained policy of regeneration and more intensive fire protection would conserve Ontario's forest wealth.

Citing how New England, Michigan, Minnesota and Wisconsin had squandered their timber wealth, and how England, France and Germany had adopted reforestation only after prodigal policies had taught them a bitter lesson, Dr. Howe said that Ontario, if it had any regard for the future, must heed the lessons of history.

Ontario, he said, through a lack of progressive timber policy, was paying from $12 to $20 freight charges on every thousand feet of lumber it imported from British Columbia and the southern states, when it had an abundance of the same wood within 100 miles of Toronto, Hamilton and London. This was all because citizens of Ontario had not taken an active interest in mouldering the forest policies of its government.

An important transfer in pulpwood lands took place in New Brunswick recently. J. L. Peck sold his holdings in the eastern section of Albert county to C. McFarlane. About seven million feet are involved. The purchase price is said to have been in the neighborhood of twenty thousand dollars. The intention is to cut as much as possible during the Winter, shipment to be made via the Bay of Fundy to the United States. The pulpwood holdings are situated in close proximity to the bay, and it will be a comparatively simple matter to export by barges.

The Barber division of the Provincial Paper Mills, Limited, at Georgetown, Ont., has resumed the manufacture of enamel blotting paper. While blotting paper is made to some extent in Canada, the home article has not been found to be suitable for enameling and the product is imported from Virginia. The paper being turned out by Provincial is an unusually fine sheet and is being stocked by the jobbers.

The Thompson & Hyland Lumber Company, Toronto, have made contracts for 67,000 cords of pulpwood to be delivered within the next six months. As soon as the snow falls in sufficient quantity to enable settlers to haul wood to the stations for transportation on cars, the company will begin shipping and expect to send forward 600 cords a day, about a quarter of which is for pulp and paper concerns in the United States.

Paper and Board

New York, November 27—While there has been some expansion of trade in certain kinds of paper reported during the past few days, demand for other grades continues rather slow. Viewing the market as a whole, there is fair activity and yet business hasn't the snap that is usually a feature at this period of the year nor is there the volume to demand for most descriptions of paper that ordinarily characterizes the pre-holiday season and that manufacturers had been prone to anticipate at about this time.

Consumers continue to buy on a very reserved scale. This is particularly true as regards writing, book, wrapping and tissue papers, and one of the unfavorable features of the prevailing situation is that mills producing these papers have but a small amount of business ahead, that is relatively speaking. Of course, demand for print paper is exceeding anything the industry has ever known, and newsprint manufacturers are working full blast and are more troubled with difficulties in supplying their customers with all the paper wanted than with locating an outlet for their production. Doubtless the heavy movement of newsprint and some other kinds of paper such as bag and building papers serves to offset the proportionately lighter demand for other descriptions of paper, thus making for a market of normal dimensions when every kind of paper is considered, but this does not deny the fact that a good many manufacturers are in want of additional business and that operations in a large number of mills are not up to a scope customary for this time of the year.

The statistical report of production for September compiled by the American Paper and Pulp Association shows an appreciable falling off of paper output in that month compared with August, but the association reports that it is probable the October summary will show an increase of production over September. In its latest bulletin the association points out that basic business conditions are good and that there is every indication consumption of paper of various kinds is on the rise following the recession in September, which came after better than normal production in the summer months.

Activity in the newsprint industry shows no let down. In fact, it is likely that demand is at its crest at the moment since publishers are printing large issues to carry all of the pre-holiday display advertisements and since circulation of newspapers invariably is greater at this period of the year. Newsprint mills are running at maximum capacity and are shipping out their product about as rapidly as it is produced. Stocks are reported low, and there is small likelihood of demand diminishing to any material degree during December, so that this branch of the paper industry will probably close the year with a blaze of activity. Furthermore, manufacturers are now arranging contracts with publishers for 1924 deliveries, and, according to reports, orders are for equally as large tonnage as, and in many cases larger, than publishers have been absorbing in recent months.

Book papers are meeting with fair demand but there is still not enough buying to keep all mills making book paper working at anything like capacity. However, quotations are steadier than they were, and there is a tendency in some quarters to stiffen. Fine papers are wanted chiefly in small lots. Jobbers are ordering in a way merely to cover their immediate needs, and printers are buying in a similar manner. Wrapping paper is in a little better demand, reflecting the pre-holiday trade, and tissues are moving in fair volume at maintained prices.

ATHENS, Wis.

CURRENT MARKETS—Continued

No improvement of consequence is noted in the board market. Demand is comparatively slow and most mills, particularly in the East, have curtailed operations. There is little doubt, that weakness in waste paper—the principal raw material of board mills—has had considerable to do with the decline in box board prices, and now that paper stock values exhibit a strengthening trend it is likely board prices will steady if not advance as the two usually follow each other very closely. Plain chip and news board are quoted at about $45 a ton f.o.b. New York, with some manufacturers quoting higher on news board though with others shading this price in some instances on chip.

Mechanical Pulp

Quotations on mechanical wood pulp are marked by firmness and there is fair activity in the trade. One thing seems sure and that is most of the ground wood being offered by producers is meeting with a ready sale, and under such circumstances prices are well sustained and in some cases buyers are granting premiums to secure quick shipments. On the other hand, it would appear as though quotations are on rather broad ranges. Domestic ground wood is quoted at around $42 per ton f.o.b. pulp mills, with prices of a couple of dollars on either side of this basis named, but quotations from Canadian producers are said to run all the way from about $37 a ton at pulp plants up to $50, prices depending on the air dry test and the freight from grinding to consuming points.

Foreign and Domestic Chemical Pulp

The tone of the chemical pulp market shows signs of steadying. In fact, it can be said that there is a greater degree of firmness to be noted than has characterized the market in a long time, but the improvement seems due more to increased confidence among those on the selling side of the trade regarding the outlook than to any appreciable broadening of demand from paper mills. Consumers continue to buy in a most reserved way, seldom absorbing other than pulp directly and actually required, but with the winter near and the Baltic due to close almost any day, importers are expecting a spurt of demand and sellers in general are seemingly less anxious about disposing of stocks they have unsold. Prices are quite irregular though the tendency has switched to an upward direction,

CURRENT MARKETS—Continued

and importers and domestic producers are more insistent on obtaining the prices asked than they were. Sales of strong foreign unbleached sulphite at around 2.85 cents a pound ex dock New York, and of No. 1 foreign kraft at 2.75 cents on the dock have been reported. Quotations ex dock New York and f.o.b. pulp mills are:

Sulphite foreign—

Domestic Rags

The market for papermaking rags lacks feature. On the whole, there is a fair demand from consuming quarters yet it is apparent papermakers are buying mostly in a hand-to-mouth manner and that the aggregate movement toward mills is not up to normal for this time of the year. Dealers contend, however, that rags are not coming in from collection sources in usual amounts, and this condition at the supply end evidently offsets the lighter call for rags from consumers.

Roofing stock is moving probably as freely as any other class of rags, and prices hold at about 1.35 cents a pound f.o.b. New York for No. 1 packing and 1.25 cents for No. 2 roofing. Old whites are quotably steady, and thirds and blues are holding their own in price. Some grades of new cuttings have stiffened in price, No. 1 white shirt cuttings being quoted at a minimum of about 12.75 cents a pound f.o.b. New York, washables at 5.25 cents and higher, blue overall cuttings at 8.25 cents, and light silesias at 8.25 cents. Quotations f.o.b. New York follow:

New Shirt Cuttings,			
No. 1	12.75	@	13.00

Roofing Rags, No. 2	1.25	@	1.30

Imported Rags

Paper mills are purchasing imported rags rather slowly though occasional sales of moderate importance are reported by dealers. Dark colored cottons are moving whenever importers will accept about 1.35 cents a pound ex dock New York, and blue cottons are in fair call at about 2.50 cents ex dock for German blues and 2.75 cents for French light blues. Prices on an ex dock New York basis are:

CURRENT MARKETS—Continued

Bagging, Rope, Etc.

Demand for old rope continues good and prices on this article are firm and tending higher. Dealers quote 6.75 to 7 cents a pound f.o.b. New York for No. 1 domestic manila rope, and foreign manila rope is reported fetching up to 6.50 cents ex dock at this port. Old bagging is comparatively quiet but is holding in price. No. 1 scrap bagging is quoted at 1.25 cents a pound New York, and roofing bagging at 90 cents to $1 a hundred pounds. F.o.b. New York quotations follow:

Gunny, No. 1	1.30	@	1.40	Wool Tares, heavy .	1.40	@	1.60
Foreign	1.20	@	1.30	For. Manila Rope .	6.25	@	6.50

Roofing Bagging ..	.90	@	1.00				

Old Paper

Prices of old paper have finally turned steadier after a rather long-drawn-out period of steady decline, and in at least several grades market levels have moved just a little above the bottom levels reached a few days ago. Demand from consuming sources is still quiet. Board manufacturers are buying in small volume and so are other consumers, yet the low level of values has affected collections and with less supply available prices display a steadier tone. Old folded newspapers are quoted at 80 cents a hundred pounds f.o.b. New York, which represents a slight advance, while No. 1 mixed papers are quoted at 50 cents, also a bit above the recent low point. Shavings are quoted at 3.75 to 4 cents a pound for No. 1 hard white, and 2.85 to 3 cents for No. 1 soft white shavings f.o.b. New York, prices depending largely on the quality of packing. Old flat magazines are selling at 1.40 cents a pound New York, old No. 1 kraft paper at 2 to 2.15 cents, and white blank news at around 2.15 cents a pound. Quotations f.o.b. New York are:

No. 1 Hard White Shavings	3.75	@	4.00	Kraft No. 1	2.00	@	2.15
No. 2 Hard White Shavings	3.25	@	3.50	New Manila Cuttings	2.00	@	2.25

Ledger Stock	1.90	@	2.10	Common Paper	.35	@	.40

Twines

The twine market shows improvement. There is a better all round demand and the advancing position of most kinds of raw material tends to strengthen prices of the finished product. Consumers are mostly ordering in small lots but the movement of supplies nevertheless is expanding. Quotations follow:

Sisal Hay, pure ...	12.25	@	13.25	Jute Wrapping twine, A grade	19.00	@	
Manila Hay, pure..	16.25	@	17.25	Papermakers Twine.	10.50	@

Sail twine, A grade.	19.00	@		No. 7	13.50	@	

Chemicals

What is described as a trade war between several leading producers is making for price easiness in bleaching powder, and consumers are reported securing some supply of bleach down to 1.25 cents a pound f.o. b. works. Casein is quoted at about 14 cents a pound and is in fair demand. Quoted prices of other papermaking chemicals are maintained.

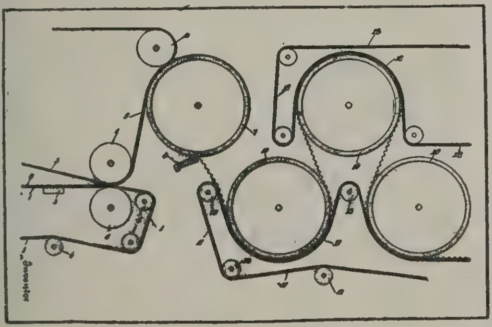
Improved Process of Creping Paper

The Best and Most Profitable

For the manufacture of CREPED PAPER Napkins, Toweling or Stretchable Bag Papers and Creped Packing or Crepe Wrapping Papers the system has no equal



The crepe being formed while the fibres are steaming hot and pliable is dried without stretching; not only retaining form better, but shedding less lint than cold creped paper products.

For particulars address:

Tompkins-Hawley-Fuller Co.
VALATIE, N. Y., or OREGON CITY, ORE.

Hamilton Board Felts

OUR style No. 82 top felt and style No. 87 bottom felt have the bulk of the filling threads on the face of the fabric. This style of weave causes the felts to give a smoother finish and longer service than can be secured from plain weave board felts, besides shedding the water better. They do not "roll on the edge" and are billed at the same list and pound prices as are our plain board felts.

ORR FELTS and JACKETS

Lowest Cost per Ton

If you judge felt values, not by what you put into the equipment, but what you get out of it—then you will specify ORR 3 stripe Endless Felts for ORR felts will produce the lowest cost per ton. They "stand up" under severe usage. Orr durability is acknowledged everywhere. Their strength and long life are as dependable as their reliability and quality.

In the 32 grades of Felts and Jackets we can match your most exacting demands. Tell us the kind of paper you desire to make, and we will send you samples of felts that will economically serve you and help you to produce paper at lowest cost per ton.

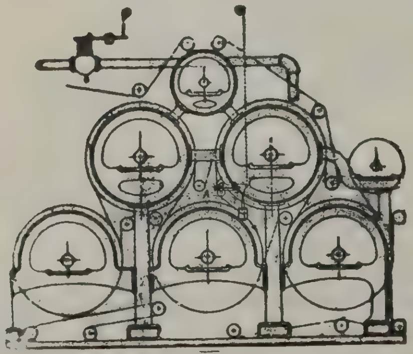
THE PICKLES DRYING REGULATOR



Reasons why you should have it on your machine are: First, it regulates the drying of paper automatically, irregularities are eliminated; second, higher machine finished papers are attainable, because it is possible to maintain the proper quantity of moisture in sheet, as it passes to calenders; third, mills having tried it on one machine have ordered it for all their machines. Improvements in Fine Papermaking

While Process Remains Practically Unchanged Many Refinements Have Been Introduced which Tend to Improve Product and Lower Cost

By I. Gordon, Member of TAPPI
Lee Paper Co., Vicksburg, Mich.

ALTHOUGH many improvements have been made in the last twenty years, the process of papermaking itself remains practically unchanged. Our industry, like others, has continued to look ahead for new ideas, for new raw materials, for new machinery; in fact, for anything that might give a better sheet or lower the cost of a process of manufacture.

With prices as they are today, with the consumer remembering what they were years ago, and with the increased production per machine, not mentioning new mills, we have been forced to find ways and means of making a product for the consumer which he may feel is not prohibitive as to price.

Moral Effect of Waste Prevention

We hear much at the present time about the elimination of waste, for the reason that competition is exceedingly close and selling prices are figured so near the cost that waste in making an order may turn it into a loss; or, on the other hand, an improvement in a process may put the mill in a position to underbid for certain business.

An added effort should be made to eliminate waste for the effect it may have upon employes. Most of them will co-operate when they see the heads of departments earnestly doing all they can in this direction. A good hardworking organization is a big asset to any firm adn this is possible only when each and everyone feels that the quality of the finished product depends on their individual work.

Fine mills are paying more attention to the quality of water used with the result that much artesian well water is now employed. Artesian well water has a constant temperature throughout the year, which means less trouble in sizing. Artesian well water is constant in quality, thereby avoiding changes that might be made by the refuse of mills up the river, by vegetation, by rainfall, or by the spring freshet. Artesian well water is usually colorless, thus insuring less annoyance to the superintendent when trying to get the same shade at different periods of the year.

Fine writing mills are still using the Holland beaters. Some prefer the corrugated bars while others have success in using bars of different compositions, but most mills want bars made by the manufacturer who built the beater. The Niagara type of beater is comparatively new and we can not say how much it will be used in the fine paper industry of the future. A few fine mills are trying out this beater. It is said that the Niagara beater heats the stock to a higher temperature than does the Hollander. The rate of circulation is faster, which means shorter beating time, and some aver that the horsepower used per pound of stock is higher. The important questions determining whether the Niagara can survive and which have to be answered before the fine paper mills will install it in quantities are: Can it produce equal or better stock, will the stock be difficult to size, and how much does it cost to run?

The improvement in the making of rosin, where firms with specialists produce it instead of the mill size man, has helped the fine writing mills. No man in a mill, with its inadequate equipment and with little or no knowledge of the chemistry of size manufacture, can produce as uniform a milk of rosin. In former times, when a size man left his job, or fell sick, it devolved upon the mill foreman or superintendent to train another in the mysteries of sizing. The size man was often one without education, except to know how and when to put in the different quantities and if anything out of the ordinary happened, he was often at a loss to suggest a remedy.

There is a story told of one size man who had a formula for adding a secret solution to the rosin in order to make it of a higher quality. It happened that this man fell sick one time and in order to make the size they broke into his cupboard for the magic fluid. Some of it was sent to a chemist for analysis and the report came back that the fluid was distilled water!

Mill superintendents have plenty of trouble making hard sized papers, without surmising or feeling that the size may be at fault when anything goes wrong. The present method has given confidence in size uniformity.

Sizing methods are changing slightly and men are constantly working for something new. Except for the use of glue, starch, rosin, alum, and silicate, sizing methods are mill secrets or patented processes. Mills have their own processes and there are no two mills that put in the same materials or make them in identically the same manner, though the basic principle may be the same.

New Machinery and Methods

The flat screen has given away to the circular screen in most cases; it is much easier to work with one plate all the time than to change plates to fit the stock. There are no screws to break off and the jar is even the whole length. The circular screen is revolving and is washed periodically.

Suction rolls have met with favor in most of the fine mills. The manufacturers claim longer life to the wire, ability to eliminate top couch and jacket, a dryer sheet when leaving the wire, less broke and greater production. One setback is the two-sided effect in the colored sheet, which however, may be eventually overcome by the use of fast dyes.

The old multiple-shaft system of winding has given way after passing through the different stages of progress to the two-drum surface winding method. The multiple-shaft machine wound a roll on a shaft driven by a slip belt or friction clutch. Although it had a cheap initial cost, it took lots of power and the resultant rolls were not always up to standard. Machines are now being built to give a good uniform roll with less power consumption.

Another change which is more individualistic with the different mills, as to method, is the procedure of drying the paper after it has passed through the size tub. Mills are changing from the loft system to a machine air-dry method, on account of the cost, and are making a sheet which is as good for practical purposes. There are many systems in use but the principle is to dry the paper at a lower temperature than that of the steam dryer by the use of dry air. These processes consume minutes where the loft requires days.

The sheet-calender method of finishing is gradually going out of use, where the paper is wound on rolls from the machine, and is giving way to the supercalender finish. The mills can get the same finish on the supercalenders as on the sheet calender, with a probable slight loss of cockle, and at the same time eliminate the slow feeding process of a sheet at a time, thereby getting greater production, which tends to lower the cost of the finished paper. The broke is lower and less calenders are needed.

Sorting the paper while cutting it into sheets of the required size from the roll has been found efficient in lowering the cost of some grades. This cannot be used with a bad lot or where close sorting is required. The cutter process of sorting is to throw out imperfect sheets as they are cut and when the load is a few inches in height to fan it on the sides to get those which have been overlooked. This method seems to be haphazard, but on trying it a few times with a check of sorting by hand, one will find it fairly efficient.

All fine mills have some electric-driven machines and in many regions where electric power is cheap the motor-driven machines are displacing water or steam driven types. We are beginning to hear of whole mills being electrified. Perhaps in the near future nothing but electricity will be used because of the economy effected by doing away with line shafts and bearings. It is less trouble to fix one machine than to shut down a whole system for it or to come in Sunday for the job, if it could be delayed until Sunday.

How Associations Help

The different organizations, similar to the Technical Superintendents, and Cost associations have worked out and given much valuable information along improvement lines and are ready to help at any time when called upon. Their meetings give ideas to mill representatives, and mills should continue to send men there to receive what they can on how the other fellow is progressing and compare with his own mill. A convention trip may not show returns the first or second time, but is bound to do so sooner or later. A trip is similar to a chemical experiment; many trials are made until the best method is found and when it is brought to light it pays for all the trouble and expense.

The increased use of cost systems has done much for advancement in the paper industry. It is not so

(Continued on page 20)

Rapid Analysis of Paper

French Technologist Explains Method for Quickly Determining Constituents of a Paper Sample for Purposes of Duplication

By Jacques Crolard

The following paper, which was written from the standpoint of a manufacturer who is asked to duplicate a sample of paper submitted to him by a customer, shows how the qualities of the paper are first determined by physical and chemical means. It will show the manufacturer what to expect from his works chemist when he is called upon to analyze a paper sample so that the information may be supplied to the plant superintendent to enable him to duplicate the paper in the mill. The article is translated from Le Moniteur de la Papeterie Francaise and is very interesting and worth the attention of all paper technologists and executives.—Translator.

WHEN a sample of paper is given to a paper manufacturer to be duplicated, his first move is to examine the paper carefully to determine what he can, about its qualities and then to compare it with another sample of paper which he may have in his files and which appears to resemble the first most closely. But that is as far as he can go, for his very next question is how do these two samples of paper differ from one another and in what way can the manufacturing process be modified so that a duplicate of the sample can be obtained? This is not a question of approximating the paper but of duplicating it exactly, for the conditions under which the paper may be used in printing do not permit the attainment of the same good results with a poor duplication of the paper.

Problem for the Chemist

The problem is thus up to the chemist. He is asked to do two things. He must analyze the two papers to determine the characteristics of both and be able to compare their properties. Then he is asked to outline the manufacturing conditions which will duplicate the sample of paper exactly. This is really the only scientifically correct and practical method of arriving at the information that is required, for paper is a rather complex product, containing as it does various kinds of pulp, fillers, sizing materials, coloring matters, etc., all of which have marked effects on its qualities.

One of the most important properties of a paper is its content of mechanical wood pulp. This is the first matter to consider in making an analysis. It is necessary to determine the exact amount of mechanical wood in the paper and it will be interesting to discover whether there is a reliable method of finding quickly the approximate proportion of this ingredient in the paper.

The first step, before determining the quanitative proportions of various kind of fibers, is to identify these. This examination allows the following classification to be made in case of the simplest kinds of paper:

1. Paper containing wood pulp and chemical pulp.
2. Paper containing wood pulp, chemical pulp and rag stock.

A number of simple reactions are available for telling the difference between these fibers. All the different fibers which are used in making paper can be recognized in this manner, but generally a paper will not contain more than three of these.

There are certain organic compounds which are absorbed in different proportions by the various kinds of cellulose fibers. The amounts absorbed, however, always remain the same for any one kind of fiber. Hence it is always possible to determine the fiber by examination in this way. There are quite a few of these substances, but there are two which are very well-suited for this purpose, as they will give accurate results when the fibers are placed in solutions of these chemicals of constant concentration and under similar conditions. Phenols and aromatic bases are most satisfactory.

In carrying out the examination a known weight of paper is digested with a definte volume of a standard solution of phenol or aromatic base. At the end of a certain length of time, which is sufficient for completion of the absorption process, the excess of phenol or aromatic base which is still left in the solution is titrated. This gives the weight of phenol or aromatic base which is absorbed by the cellulose fiber. Certain calculations can then be carried through, which will be explained below, to determine the percentages of the different fibers in the paper.

In table I is given the results of a large number of tests which were made to find the average amounts of phenol and aromatic base absorbed by the different classes of fibers.

Table I

Relative Absorption Capacities of Different Cellulose Fibers

	Phenol	Aromatic Base
Pure cotton	0.2	1.1
Rag stock	0.5	3.0
Esparto	0.7	3.7
Bleached sulphite pulp	0.8	5.0
Bleached straw stock	1.1	6.2
Bleached soda cellulose	1.2	6.5
Unbleached sulphite pulp	1.2	6.6
Bleached jute stock	4.1	10.
Mechanical wood pulp	8.	12.

It was found that mechanical wood pulp made in various countries differed considerably so far as their phenol absorptive capacity was concerned. The variations were from one to two percent. However, this variation is about the same as the experimental error incurred in making the analysis.

Calculating Percentage of Mechanical Pulp

The first case that will be considered will be the simplest one, a newsprint containing both mechanical wood pulp and unbleached sulphite pulp. Two equations are necessary to arrive at the results. These are as follows:

$$B+M=100 \text{ and } \frac{p_1}{100}B+\frac{p_2}{100}M=P$$

The symbols in these equations have the following significance: B represents the proportion of sulphite pulp; M represents the proportion of mechanical wood pulp; p_1 is the absorption coefficient of unbleached wood pulp or 1.2; p_2 is the absorption coefficient of mechanical wood pulp or 8.0; P is the phenol absorption coefficient of the paper.

The value of M is obtained from the following equation, which is itself obtained by solving the simultaneous equations given above:

$$M=\frac{100(p-p_1)}{p_2-p_1}$$

This formula also possesses a certain value in the determination of the proportion of a certain grade of pulp found in a mixture of two kinds of fibers, if the values of p_1 and p_2 are sufficiently distinctive.

It may be assumed that in analyzing or testing the paper, the value of P was found to be 5. Then as the values of p_1 and p_2 are known, being derived from table 1, the percentage of mechanical wood pulp in the paper can be found by substituting these values in the equation for M, as follows:

$$M=\frac{100(5.0-1.2)}{8-1.2}=55.7 \text{ percent.}$$

However, in practical work the problem is generally much more difficult than the one which has been solved above. Mechanical wood pulp may exist in a paper in combination with bleached sulphite pulp and rag stock, casse paper for example. The equations which were given above will then not be sufficient to give the desired information. In this case there are three unknown quantities to be determined in the place of two; thus it is necessary to write equations containing the unknowns, percentage of mechanical wood pulp, percentage of rag stock and percent of sulphite pulp. This, then, means three equations and in writing the third it is necessary to use the coefficient of absorption with the aromatic base.

Thus the three following equations are formed:

$$B+M+C=100.$$

$$\frac{p_1}{100}B+\frac{p_2}{100}M+\frac{p_3}{100}C=P$$

$$\frac{a_1}{100}B+\frac{a_2}{100}M+\frac{a_3}{100}C=A$$

The symbols B, M and C represent respectively, the percentages of sulphite wood pulp, mechanical wood pulp and rag stock present in the paper. The symbols p_1, p_2, p_3, a_1, a_2, a_3 are the coefficients of absorption of these different grades of pulp and may be found in table I. P and A represent the absorptive capacity of the paper for phenol and the aromatic base, respectively. The solution of these algebraic equations to give an expression for M or for B or C involves simple algebraic operations which are too familiar to require explanations here.

After these expressions or roots have been found, all that is necessary is to substitute the following values in the equations:

$p_1=0.8$ $p_2=8.0$ $p_3=0.3$
$a_1=5.0$ $a_2=12.0$ $a_3=3.0$

P is found to be 2.1 and A 5.4 by actual test. Under these conditions the percentages of the different grades of cellulose in the paper are found to be as follows:

Mechanical wood pulp=M=20.5 percent
Chemical wood pulp =B =30.0 percent
Rag stock =C =49.5 percent

Accuracy of the Method

It is evident that the method described above is a very rapid one and possesses distinct advantages over the more exacting chemical and microscopic methods in that it is much easier to carry out than these, consuming much less time and labor. In the following tabulation is given the results obtained by chemical analysis compared with those obtained by the mathematical method described above.

TABLE II

Determination of Mechanical Pulp and Chemical Pulp in Paper

No.	Nature ot fibers Method of analysis	Sulphite pulp $p_1=0.8$; $a_1=5.$	Mechanical pulp $p_2=8$; $a_2=12$	Rag stock $p_3=0.5$; $a_3=3.$	Phenal absorbed P	Aromatic base (anilien) absorbed A
1.	Composition of paper	30	20	50

The values which are given in this table are the average of ten different determinations in each case. In practical work the chemist need not repeat his tests so many times. Each test should, however, be made five successive times and the average results taken and substituted in the equations.

By an examination of the figures in table II it will be seen that the error incurred in the mathematical process does not exceed one percent in the entire series of operations. Each if it is admitted that there will be an error of at least that amount in making the titrations, the results will be accurate within two to three percent. On the other hand, it is impossible to obtain results which have an error of less than five percent in making an analysis with the microscope in the ordinary way.

Rapid Approximate Method

The question is often asked, does this or that paper contain mechanical wood pulp and if so how much does it contain approximately? It is not a matter of determining the mechanical wood content within a few percent, but to tell whether the paper contains 30 percent, 50 percent or more of this kind of cellulose. In such cases it is not necessary to make any chemical analysis as this would take too much time, even when made in accordance with the method given above. A very simple method is used for this purpose and it is, of course, always possible to substantiate the conclusions reached from this examination by making an exact quanitative determination.

There are certain organic compounds, among which may be numbered the phenols, amino-phenols and amines, which possess the property of producing very vivid colorations with ligno-cellulose.

There are various organic compounds which will color mechanical wood pulp but will not produce any coloration on any of the other grades of wood pulp. One of the commonest reagents used for this purpose of phloroglucin, which dyes mechanical wood pulp a bright, scarlet red. The following table indicates the color reaction that takes place on mechanical wood pulp when a drop of various chemicals is placed on it.

Coloration of Mechanical Wood Pulp with—

Phenols and Amino phenols		Aromatic Bases	
Phloroglucin	red	Phenyl hydrazine	yellow
Pyrocatechin	violet	Dimethyl-paraphenylene-diamine	red
Alpha naphthol	green	Aniline sulphate	yellow
Beta naphthol	rose	Chlorhydrate of para-nitraniline	orange
Ortho amino phenol	yellow		

Fundamental Bases of a Colorimetric Method

There are certain objections which may be and have been raised against the use of a colorimetric method for determining the presence and the amount of mechanical wood pulp in a paper. The organic chemicals that are employed for this purpose are known to lose their coloring power as they age. The intensity of the color produced does not vary proportionally with the percentage of mechanical wood pulp present in the paper. It is, however, true that this opinion is based on experience with inaccurately made analyses. When the colorimetric determinations are made in the following manner there will be objection to them, for the results are inaccurate and unreliable.

The first thing that is generally done is to select a powerful reagent such as phloroglucin. Then it is necessary to make a colorimetric scale with the aid of this reagent. Thus it is possible to make up a set of samples from papers containing varying percentages of mechanical wood pulp and to use these standard color cards in examining the unknown paper. This method is simple enough, but it is bound to give poor results. The results are never constant, for the reason that the intensity of the coloration depends on factors that very easily. Thus, the concentration of the reagent, the age of the same and other factors, such as the variation in the intensity of the drop of the reagent with the duration of the reaction. It is easy to determine that in several cases the intensity of the color at the end of ten minutes is double the intensity after five minutes. Furthermore, this condition is itself variable.

The colors that are obtained in testing the unknown samples of paper are compared with those obtained with standard papers. This method immediately circumvents the first criticism which has been mentioned above. In this case the analysis is relative in character and hence all the variable factors act in the same manner on the unknown paper sample as on the standard papers that are used in the analysis. Even when the reagent is old and has been used for a considerable time, accurate results will be obtained for the colors will still be clearly defined and of an intensity which varies with the proportion of mechanical wood pulp that is contained in the paper.

The second objection which is cited above can be answered by observing what happens when a drop of the reagent is placed on the paper sample. Thus, for example, when a solution of the chlorhydrate of phloroglucin is used in the analysis at a fixed concentration, if there is any mechanical wood pulp present in the paper the latter will be seen to become redder and redder at the point where the drop of the reagent fell. If papers containing as much as 50 and 80 percent of mechanical wood pulp are examined, it will be seen that the intensity of the color in both cases is the same, even though the percentages of mechanical wood pulp are much different. This is due to the fact that the color produced by a paper containing 50 percent of mechanical wood pulp, is the deepest that the eye can detect. Deeper reds are beyond the visible range.

This difficulty may be circumvented in the following manner. When it is desired to determine the proportion of mechanical wood pulp in a certain paper, after it has been found that the first test will not give the desired results, it is necessary to find a concentration of the color-producing reagent which will yield a color with the paper that is within the visible range. On the contrary, when examining papers, which contain only a slight amount of mechanical wood pulp, it is advisable to use a reagent which will give as strong a color as possible.

In general it will be necessary to have on hand two concentrations of the reagent only; one, the more concentrated solution, will serve for testing papers containing small proportions of mechanical wood pulp, and another of smaller concentration for testing papers which contain more than 40 percent of mechanical wood pulp.

Method Employed in Applying Test

Two samples of paper are cut from the unknown paper and from the known standard paper. For example, say that it is known that the unknown paper contains somewhere in the neighborhood of fifteen percent of mechanical wood pulp. Then a sample is cut from the standard 15 percent mechanical wood pulp paper. These two samples are then dipped simultaneously in a solution of phloroglucin of known concentration. After the papers have colored it is an easy matter to determine by comparison of colors whether or not the unknown paper contains more or less than fifteen percent of mechanical wood pulp. If the colors produced on the papers are equal in intensity, then it may be concluded that the unknown paper contains fifteen percent of mechanical wood pulp. In order to determine the delicacy of the test, it is an easy matter to take two samples of paper, one containing fifteen percent of mechanical wood pulp and the other twenty percent of this cellulose and compare the colors that are obtained with the phloroglucin solution.

Careful study and experimentation with this process have led to the conclusion that it is sufficiently accurate to give a good approximation of the percentage of wood pulp contained in a paper. The method is extremely rapid, requires few reagents and can be readily applied by the ordinary laboratory worker.

(To be continued)

Silicate of Soda in the Paper Industry

Comprehensive Review of the Literature of the Use of Silicate of Soda in Papermaking Processes

By WILLIAM STERICKER, PH. D.

Philadelphia Quartz Co.

Sizing

Ink Resistance:—According to Blasweiler, there have been sporadic attempts for over forty years to use either sodium or potassium silicate as substitutes for rosin in paper sizing. It was not until 1907, that Klemm[1] pointed out that both silicate and rosin might have a place in paper. Sizing is frequently considered to mean the resistance to the penetration of aqueous inks. This is not a satisfactory standard for printing papers since printers' inks are actually oil varnishes. Rosin sizes against aqueous solutions but not against oily liquids. Silicate is valuable for the latter. Although sixteen years have elapsed since Klemm's article appeared, the distinction is not fully recognized in the paper trade even now.

Method:—The method of using the silicate depends to a large extent on the kind of paper and the regular practice in the mill. The following[2] has been found to give maximum retention in many cases. It is also advantageous because it interferes to the least extent with the routine of the mill operation. The silicate is added to the pulp in the beater before any color or other size has been added. Sufficient alum[3] is then added to precipitate the silicate and the rest of the process carried out as if there were were no silicate present. Sodium metasilicate[4] is of no value for this use while the higher the ratio of silica to soda in the silicate solution the better results are obtained[5].

Effects:—In discussing the use of trimmings for corrugated and solid fiber board as part of the beater furnish Burt said the silicate present was injurious to the size. He claimed there was 7% of silicate in such trimmings[6]. Vail[7] replied that this was only the case when insufficient alum was used. If enough were added, all the silicate would be precipitated and slack sizing would be avoided. In addition, the silicate would increase the retention of the rosin and improve the hardness and finish of the paper.

An individual, who prefers to be known as "Greaseproof," gives[8] the following description of the effect of silicate. When acids or acid salts are added to soluble silicates in the beater, silica is precipitated as a gelatinous hydrate. This permits the pulp to carry more water onto the machine and hardens the paper. Vail[2] has given a more extended description of the effects of silicate. These results are based on mill tests with large quantities of paper using 2-4% of silicate. There was an average increase of 12% in the Mullin test. The ink resistance was increased, probably due to the increased retention of rosin[9]. If the silicate is carefully added at the correct time, there are no deleterious effects on the colors. When no rosin is used, discoloration on aging is minimized. The hardness, rattle and finish of the sheet are improved.

Blasweiler has carried out a long series of experiments under the direction of Emil Heuser, one of Germany's greatest paper and cellulose experts[10]. He used $Na_2O.3SiO_2$ using from 5 to 30% of silicate. The experiments were made in a 30 liter hollander using 2.5-3% of pulp. The results found confirm and extend those previously mentioned. In every test the tensile strength of the paper made with silicate was increased. The maximum was

[10] 10.—Papierfabr. 19, 809-16, 875-7 992-7, 1108-11, 1217-23 (1921) A condensed translation by West appeared in Paper 28, No. 22, 20-21; No. 24, 20-2; 29, No 6, 19-20. The original articles have appeared as a book, "Die Verwendung von Wasserglas zum Leimen von Papierstodd". (Elsner, Berlin, 1922).

18.5% which was obtained with newsprint. The hardness and rattle or snap were greater. The finish and feel were improved. The suction on the paper machine was good and there was no sticking on the pressure rolls so less water could be used. The suspended matter in the back-water settled rapidly and completely. The colors were brighter and did not fade as rapidly on silicated papers. The cut paper laid flat and the behavior with printers' ink was improved. The silicate also increased the retention of loading materials.

Straw Paper:—A. R., who translated this work into French, was led to tell of his own experience with silicate in sizing straw paper[11]. In order to speed up production the digestion of straw was carried out under high pressures. This causes hydrolysis and porous paper resulted. When meat was wrapped in it, the paper soaked and tore easily. Since most of the sales were to butchers, a method of sizing had to be found. Rosin could be used but was too expensive. Equally good results could be obtained by the use of 10-2% of silicate precipitated with alum. The former method cost more than 400 francs, the latter about 60.

Alum:—Blasweiler[10] found it advisable to add enough alum to make the solution distinctly but not strongly acid. In spite of the fact that sufficient alum to precipitate the silicate seems necessary in order to secure any good results, there are mills which consistently use silicate without any alum to take care of it. They apparently secure effects that they can detect and which they believe pay for the silicate. In some cases this is because of special qualities not directly connected with the paper. When alum is not used, the back-water is returned to the machine. This is good practice in any case as the effort of the silicate seems to become cumulative in this way. One-hundred pounds of "A-Syrup" ($Na_2O.\ 3.3SiO_2$) require about 30 pounds of alum and one-hundred of "S" Brand $Na_2O.3.9\ SiO_2$) require twenty-five pounds. In case the water is very hard or contains some acidic material, these amounts may be excessive. The intentional addition of salt or magnesium sulphate does not pay for itself.[10]

Alum Substitutes:—Frohberg[12] proposed the use of magnesium sulphate of alum but Blasweiler found that it did not give good results in the presence of paper stock. Any substitute has to compete with the additional sizing effect due to the aluminum hydrate or silicate formed by the interaction of alum and silicate. Klason[13] used sulphate waste liquor to precipitate the silicate. The rattle and finish were improved but the paper was yellowish. Franck has patented the use of fluosilicates as precipitants. So far as is evident they are not actually used. It is claimed[14] that silicate and alum may be used as a dry powder. The silicate is sprayed on solid aluminum sulphate and the mixture is then dried and ground.

Rosin:—When both silicate and rosin are used, the paper is sized for either aqueous or oily liquids. In addition, the use of silicate increases the retention of the rosin. Usually the silicate and the rosin are added to the beater in their usual form but there have been a number of proposals to combine them. Kuldkepp and Graf[15] mixed rosin and silicate in the cold to prevent the precipitation of silicic acid. Sommer[16] found that finely pulverized or emulsified rosin would dissolve in dilute silicate solutions. "Greaseproof" says that boiling silicate solutions dissolve powdered rosin forming a size similar to brown rosin soap[8]. It is important to use no more silicate than is necessary. The writer's work indicates that rosin dissolves more readily in the more alkaline silicates ($Na_2O.\ 2SiO_2$). When hot concentrated solutions of $Na_2O.\ 3.3SiO_2$ weer used, there was always a separation or rosin soap.

In 1920, Clapp proposed the use of freshly precipitated calcium silicate and aluminum resinate as a size for counter board[17]. The size was formed by the reaction of hydrated lime, sodium resinate, silicate of soda, and alum.

Bakelite:—The use of silicate with bakelite for sizing has been patented in Germany. It is claimed that good results were obtained[18]. West[19] says that the bakelite is used to bind the precipitated silica to the fibers but it seems more likely that it acts like rosin. Unless it shows decided advantages, bakelite will be too expensive to be practical.

Starch:—In 1910, Fues[20] applied for a patent on the precipitation of starch for sizing paper in the presence of silicon compounds but Klemm was able to show that he had previously used silicate with starch. Wrede[21] found that silicate and starch were better than silicate alone for sizing against non-aqueous materials. Since silicate is cheaper than starch and increases the retention of the latter, its use is advisable. The mixture increases the strength and rattle of the sheet and the retention of any filler. Fues claimed to be able to secure practically quantitative precipitation of the colloids at exact neutrality. Wrede recommended a strong excess of alum but only recovered 60-70% of the starch.

In a later article[22] Wrede claims that starch not only improves the quality but reduces the cost of manufacturing paper. It is most economical to swell the starch, add silicate, and then put the mixture in the beater. When used in writing paper, this mixture increases the strength and gives a better finish and a harder feel. Since the paper is harder and tougher, it stands erasure better. For this kind of paper it is recommended that the silicate and starch be added after the rosin size has been precipitated. In print papers it should be added after the fillers. In all papers where raw starch is used as a filler, 2-4 liters of silicate should be used with each kilogram of starch.

Soap:—Kolb claims[23] that soaps, especially the stearates, may be used to replace rosin size. When used in connection with sodium silicate, they give pronuonced size-fastness and good feel. The silicate increases the sizing action by increasing the surface area of the other materials. Blasweiler investigated both soy-bean and cottonseed oil soap with and without silicate but was unable to find sufficient improvement to pay for their use. For example, 5% of cottonseed oil soap, 5% of 38° Baumé silicate ($Na_2O.\ 3.3SiO_2$), and 10% of alum increased the tensile strength but decreased the stretch of the sheet.

Glue:—Muller[24] dissolves one part of glue in 6 of water using the usual method. While the solution is still warm, he adds a solution of 1 part of 38° Be'. silicate in 8 parts of water. When the solution has cooled, he stirs in a solution of alum. An excess of alum has to be avoided so the mixture is not completely precipitated. This material is added to the furnish followed by enough alum to give a faintly acid reaction. Muller considers that the fibers are coated since the brilliancy, the handle, and the fullness of the paper are improved. In addition, the retention of the fibers and loading materials is greater. Other colloids

may be used in place of glue and acid salts in place of alum. In any event the size would be produced before the pulp is present.

Other Materials:—Kuldkepp and Graf[25] have patented mixtures of casein or casein-like substances with silicate. Stein[25] has covered the use of algin with inorganic colloids. Possanner found silicate in a number of commercial sizes sold in Germany.[26] Humic acid is said to give satisfactory sizing when used with silicate.[27]

Fillers:—All the investigators find that silicate increases the retention of loading materials. Reichard obtains two distinct effects by the use of silicate.[28] Ordinarily when very heavy materials like barium sulphate are used to load paper, a large proportion settles out. If silicate is added to the suspension, it acts as a stabilizing medium. When the silicate is precipitated in the beater, it carries the loading material into the paper. Magnesium chloride is preferred as a precipitating agent.

Blasweiler included experiments on newsprint containing 80% mechanical wood pulp and 20% bleached Mitscherlich pulp. The use of silicate increased the retention of the china clay used as a filler and, at the same time, increased the tensile strength and improved the color.

Paper for wrapping oranges and lemons was made[29] from 30% white paper trimmings, 10% fine white ground wood, 30% unbleached Mitscherlich, 20% semi-bleached sulphate, and 10% waste paper. About 1% of silicate was added and precipitated with alum. Approximately 5% of talc colored with eosin was also used. The talc was credited with giving the paper a smooth feel and preventing molds. It seems likely that the silicate helped in these effects. The use of silicate in connection with talc is also mentioned in a patent to Altmann.[30]

Color Lakes:—Silicate is not only used to increase the retention of loading materials but also of colors.[31] When silicate is precipitated by the action of magnesium or aluminum sulphate or calcium chloride in the presence of a dye, the dye will be strongly absorbed if it is basic, weakly if it is substantive, and not at all if it is acid. The magnesium precipitate is best for basic dyes and the aluminum one for substantive dyes with the calcium intermediate in both cases. The dyes thus held are quite fast but the acid ones wash out. The retention of silica is greatest when alum and a basic dye are used. Color lakes of this type are on the market in England.

Coating and Tub Sizing

Artus[32] was the first to propose the use of silicate of soda for coating paper. He treated moderately strong writing paper with two coats of silicate of unknown composition diluted to 15-9°Be′. (sp.gr. 1.12-1.15). The first coat was allowed to dry before the second was applied. Paper treated in this manner could be used for packing salves and plasters. Concentrated silicate solutions gave a beautiful glassy coat but the paper broke when rolled. Silicate is now widely used for grease-proofing paper. It is also used as a preliminary coat under paraffin to reduce the consumption of the latter. For this work 35° solutions of $Na_2O.3.3SiO_2$ are used.

Altho silicate alone will grease-proof paper, Cavanaugh[33] has patented a paste composed of 11 pounds of silicate, 4 ounces of mica, 10 glycerol, 3 of powdered dextrin, and sufficient precipitated chalk to thicken.

Waterproofing:—Paper is usually waterproofed with paraffin alone or paraffin over silicate. It is claimed[34] that it can be done by passing dry paper through a bath of a hot mixture containing 50% resin, 45% paraffin, and 5% silicate. The proportions of resin and paraffin can be varied up to 10%.

Tub Sizing:—Wezel[35] dissolved horn shavings in caustic soda and added silicate. This solution was mixed with potato starch and then nearly neutralized with acetic or a dilute mineral acid. The mixture was then used as a tub size.

Size and Adhesive:—Morrison[36] developed a size which can also be used as an adhesive on wallboard. It consists of 3-15% silicate of soda, 1-7% glue or other organic adhesive, and 1-8% pottery clay or other filler. In no case should the organic adhesive exceed the silicate. This size gives a higher Mullin test, decreases the absorption of ink or paint, and excludes moisture. Morrison soaked 37.5 pounds of high grade glue for 36 hours in 75 gallons of cold water. He then heated the mixture to 130-60° F. for 15 minutes, slowly, and added 25 gallons of 40° silicate while stirring. After this 29 pounds of pottery clay were worked in. If desired, the silicate and clay may be mixed and then added to the glue solution.

De-Inking:—Silicate has been used in de-inking paper.[37] If the ink has a mineral oil base, hydrated lime is said to aid in the process.[38]

West Coast Papermaking

Samuel P. Taylor, of New York state, was the first paper manufacturer west of the Rocky mountains. Mr. Taylor went to California during the gold rush of 1849 but later returned to New York where he married. In 1855 he and his wife journeyed to California taking with them a 36-inch cylinder paper machine, reads an interesting review of the history of papermaking in the West which appeared in a recent issue of The Timberman.

The first paper manufactured on the Pacific coast was made with this machine. The location of the mill was on a creek 32 miles northwest of San Francisco. All the newsprint and wrapping paper used in the city was manufactured in the Taylor paper mill. Samuel P. Taylor died in 1886 but a son, Will Taylor, is still affiliated with the paper industry in San Francisco.

The second western paper mill was located at Oregon City, Ore., and had a capacity for but three-quarters of a ton daily. This was in 1866.

A paper mill was erected at Stockton in 1870 and in 1873 John Lewthwaite, the oldest living paper maker on the Pacific Coast, began working in this mill.

A list of the Pacific coast pulp and paper mills gives the number in operation now as: Alaska, 1; British Columbia, 7; Washington, 7; Oregon, 5; California, 9. There are other mills in process of erection at the present time.

The Crown-Willamette Paper company is the most important paper and pulp manufacturing firm on the Pacific coast. It employs about 7000 men in the mills and camps which it operates and 250,000 cords of wood are used annually. The invested capital of this firm is reported to be $25,000,000.

The woods used in these western mills are: Western hemlock; Sitka spruce, cottonwood, white fir and Douglas fir.

Summary of Paper Industry for October

THE statistical summary of the Paper Industry is submitted herewith for the month of October, 1923, and previous months.

The following association cooperate in the collection and compilation of data from their numbers, namely; Binders Board Manufacturers association, Converting Paper Mills association, Cover Paper Manufacturers association, Newsprint Service Bureau, Tissue Paper Manufacturers association, Wrapping Paper Manufacturers Service Bureau and Writing Paper Manufacturers association.

Tonnage Summary

GRADES	Number of Mills	Stocks on hand first of month	Production	Shipments	Stocks on hand end of month
		Net tons	Net tons	Net tons	Net tons

The National American Wholesale Lumber Association was among those petitioning the National Chamber of Commerce to issue a referendum on the question of national forestry policy, and is now giving careful study to the several recommendations involved. The latest statement issued by this organization says: "Generally speaking, practically all of the recommendations meet with approval, but realizing the desirability of the lumber industry voting as a unit on this important matter, the association is co-operating with the National Lumber Manufacturers Association and others, and before finally recording itself will await an expression from the board of directors."

Wood Pulp Review for October, 1923

THE American Paper and Pulp Association in cooperation with the U. S. Pulp Producers association submit herewith statistics on pulp production, consumption and stocks for the month of October, 1923, and previous months.

Pulp Production

The statistical table following gives the number of mills reporting stocks as of the first of the month and end of the month, production during month, amounts used by mills producing same with amounts shipped to concerns other than those producing same.

GRADE	Number of Mills	On hand first of month	Production for month	Used during month	Shipped during month	On hand end of month

Waste in Pulp and Paper Industry

White Water—The Goose That Lays the Golden Eggs

By **B. T. McBain**

Assistant General Manager Nekoosa-Edwards Paper Co.

SINCE time began, it seems, there has been an unwritten law among paper and pulp mill men that it is a crime to even consider using all white or waste water created or formed in the manufacture of paper and pulp.

When I first undertook to stop this enormous waste in a large western mill of which I was then resident manager, the Superintendent, John Lewthwaite, dean of western paper mill operators and favorably known everywhere as "Uncle John", said: "Bert, you are right, stay with it. They'll claim it can't be done, that slime forms, that the results are not worth the effort, that the waste isn't much anyway and ten thousand other reasons why. Then they will buck you if you stay with it and try to prove it can be done."

As I have said so many times, and I'm not so sure but what that same gentleman coined the phrase, "Water is only a conveyor in the manufacture of paper". You never throw away any other kind of conveyor when once used, why throw away this one? How can water used once or more than once in the process be dirty? If a mill uses unfiltered water from a river, well or spring, it might and is almost sure to contain impurities. After going through the process once, much of these impurities have been removed and the more times the water is filtered through the pulp or paper, the cleaner it must surely be. This, therefore, should remove that objection.

As to slime: Any process using water without filtration chemicals is sure to form some slime in dead ends of pipes or in pipes little used, but with properly designed piping that can be and is cleaned regularly, as any properly regulated and managed pulp or paper mill should be, there will be little trouble with slime.

As to plugging shower pipes: It is true that a different type of shower pipe and outlet must be used; but if the amount of saving is from 4% to 10% of the amount of raw material consumed, where is the mill that cannot afford to buy a Kelley, Bird or other type of shower pipe designed and manufactured especially for the use of white water?

As to the use of white water ridging and spoiling wires, we have had some wires in use longer since we started this white water campaign than before and the average is not any worse than before.

True, white water isn't good to wash the floor with and is not good for felt showers, but who wants to wash floors or felts with the dollars this white water contains and with water that can be used at screens, head box, mixing box, flow box and on wire showers besides in the make-up.

It should be considered a crime not to use white water and there should be a law and an inspector following up the enforcement of that law, that would make the wasteful manufacturer, the wasteful superintendent, the wasteful foreman, the wasteful pulp maker and manufacturer use this valuable water which really can be termed "The Goose that Lays the Golden Eggs", because the saving of all white water being wasted in most mills will be sufficient to pile up the gold in the treasury of just the companies now either almost in the hands of the receivers or wondering why they cannot make ends meet.

Use your white water and save dollars.

The Northampton Paper Stock & Mill Supply Co., at 106 Hawley Street, Northampton, has been purchased by Burt Michelman. He will continue the business at 1 Isabella Street.

Transportation Within Papermills

Economies and Savings Made by Application of Electric Hoists to Movement of Materials and Refuse

By Russell B. Williams*

TRANSPORTATION, since the beginning of time, has been a problem of major proportions. The ability to move objects, people and thought from one place to another has, in a large measure, governed the progress of all peoples. Indeed, it can be said that transportation, in its broad sense, is basic in all things industrial and social.

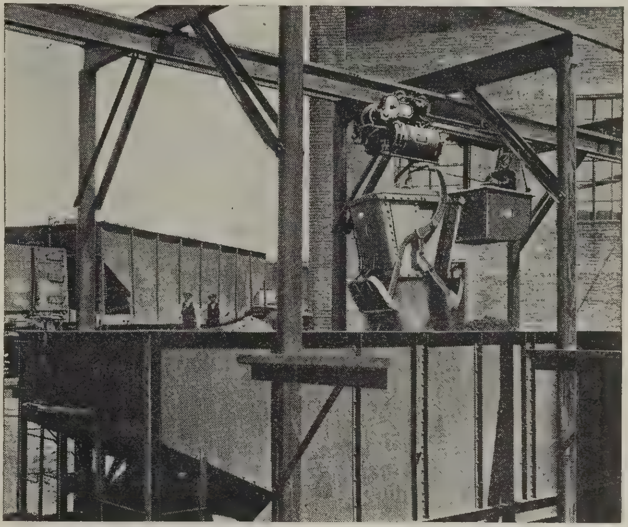
It is only reasonable to believe that many of the lives lost and much of the energy and time expended in the building of the pyraminds by the Pharoahs would have been saved if the rulers of that day had possessed facilities for transportation equal to our present day railroads. And in similar strain, the Revolutionary War would have endured for no such period as eight years had George Washington possessed a small fleet of airplanes and a few sets of radio.

But neither the Pharaohs, Washington, Alexander the Great, nor any other of the historical figures, had access to anything comparable to the modern implements designed for the transportation of people, things and thought.

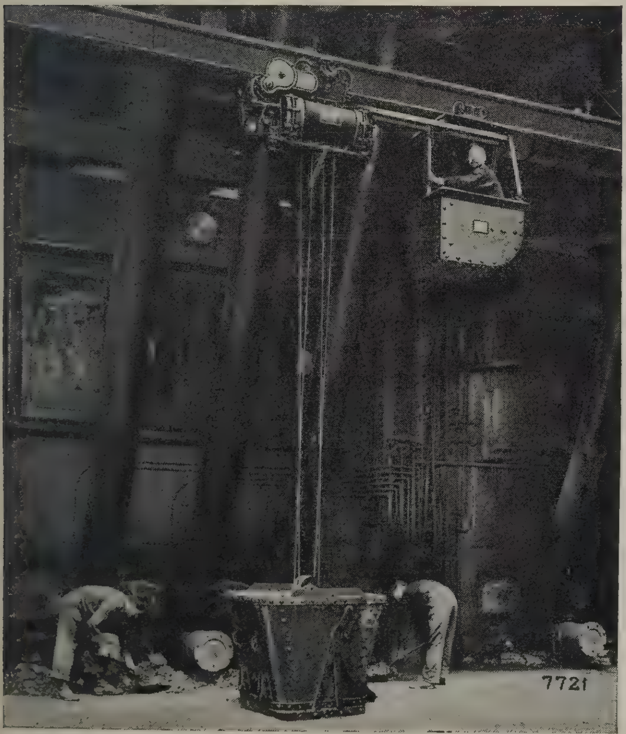
And we are poor prophets. We plan and work for the future—only to leave behind costly abandonments. Time was when men laid their business foundations, created their commercial enterprises and mapped their future successes on river boats, wagon haulage and warehouses. But the steam railroads came, and every plant, every enterprise, every success was altered and revised.

Thereafter, people tacked their faith to the steam propelled utility. But to little avail, for we now have electricity. And electricity has revolutionized industrial and social life from stem to stern.

Thus we constantly seek better methods of transportation. The bicycle, once the acme of speed and convenience, is now too slow. The tractor is supplanting the wheel-barrow; the elevator the hod; the automobile the chaise; the truck the dray. We realize, ever more fully, that given our modern appliances, hand labor and rule of thumb methods are not only obsolete but ruinous. With the result that we trim here, and pare there, the application of hand labor in all things pertaining to transportation. Moving it mechanically is better, cheaper and faster than moving it humanly.



Delivering ashes from the boiler room to gondola cars at plant of Philadelphia Paper Mfg. Co., with Link-Belt Electric Hoist.



Link-Belt Electric Hoist in power plant of Philadelphia Paper Mfg. Co.

In the solution of our transportation problems we spent many years striving to eliminate the human element from vertical handling. Though a man might more or less promisingly move an object along the floor, it required doubled and redoubled effort when necessary to reach new levels. So we invented continuous bucket elevators, spiral "Helicoid" conveyors, skip hoists, endless belt conveyors, platform elevators and other devices for the lifting and lowering of objects. And of these inventions few indeed have failed to far more than pay their way.

Now, there yet remained the problem of horizontal transportation. This presented difficulties, for in almost every instance, obstacles to progress were numerous. Machinery, work benches, piping, motors, everything on the floor, presented just that many reasons why the transportation of objects horizontally, by mechanical means, would be difficult.

So, in the solution of this problem—in the very act of scratching our heads and looking upward—we discovered the ceiling! With practically nothing on it! We had built them on every house, barn and factory, but had failed to consider them good for anything but shelter and the suspension of a light or two. After the discovery of our own ceiling, the rest was comparatively easy.

Thus it was that the modern electric hoist was made possible, a thing of rapid and ready transportation in so many plants and in so many duties. For, with the electric hoist, everything mechanical is out of the way, yet instantly available. And the act of transporting objects is identical with that of man power. The electric hoist lifts the objects from the floor, carries them to the desired place and sets them down.

---

* Link-Belt Co., Chicago.

Electric hoists, as other machines designed for the transportation of objects, have proven an unqualified success. The economies effected through their wide application are on every hand, for they have long since passed the experimental stage and have received quite universal use.

Mr. Buhler, Chief Engineer for the Philadelphia (Pa.) Paper Manufacturing Company, for instance, employs two electric hoists; one in the removal of ashes from the boiler room, which hoist has been in constant use for over nine years, and one in the disposition of rubbish—carrying it from the mill to the incinerator.

In considering the savings or economies effected by the rubbish hoist, Mr. Buhler says: "It can safely be said that did we not have the electric hoist and were compelled to dispose of the rubbish by hand, it would be necessary to add two men to our payroll. This extra help, at prevailing prices, would run into a $12 daily labor cost. Saving twelve dollars a day totals $3600 annually, considering that we operate 300 days in the year. This is the gross saving effected by our electric hoist handling rubbish from the mill to the incinerator.

"Of course, to arrive at the *net* annual saving, it is necessary to deduct all expenses incident to the maintenance of this hoist. These expenses can be calculated as follows:

Interest on investment at 6 per cent	$ 72.00
Depreciation on 10 year basis (conservative)	120.00
Repairs (estimated)	160.00
Maintenance—oil and attention	50.00
Total expense, yearly	$402.00

Thus we have an expense of $402.00 for a piece of equipment that is saving us in labor costs alone $3600. The difference, $3,198, is the net annual saving."

New Houses For Mill Workers

The construction work on the ten new houses that are being erected in the village of Port Edwards, Wis., is progressing very rapidly. The work was started some two months ago and some of the smaller houses are nearing completion.

By letting the contract for ten houses at one time the Nekoosa Edwards Paper Company was able to secure the very lowest price for work of this kind. There are four different styles of houses ranging from a 4 room, one story to an 8 room, two story. These are all constructed on concrete foundations, the houses are of tile with stucco finish. There is a full sized basement and each dwelling is equipped with a furnace.

The prices range from $2,500 to $4,500. These prices include plumbing and heating, lighting, sewer, water connection and sidewalks.

The men will purchase these from the company through the Nekoosa Port Edwards Building and Loan Association which was recently organized to finance such things.

To date six of the houses have been sold and the rest are spoken for so that by the time the last house is completed some will already be occupied.

The necessity for these new houses was caused by the installation of two new paper machines at the Port Edwards plant of the Nekoosa Edwards Paper Co.

The formation of the Nekoosa Port Edwards Building and Loan Association makes it possible for every man in the Nepco employ to own his own home and it is expected to start the construction of another lot after the completion of those now under way.

A great many of the Nepco employes are stockholders of this building and loan association as well as quite a few in the paper mill itself.

The addition of these very attractive houses adds to the appearance of the village of Port Edwards, better known as the White City.

Athletics at Nekoosa-Edwards Mill

For many years the mills of the Nekoosa-Edwards Paper Company, Port Edwards, Wis., have sponsored baseball and basket ball teams. The baseball season is over for this year and the boys are looking forward with considerable interest to indoor baseball, basket ball, bowling and other winter sports.

The indoor baseball season has started; the first game played between the Port Edwards mill employees and the office force of the same mill resulted in a victory for the former. It has been proposed to start a four team league.

In bowling a league is also under way, the Superintendents having already started plans for their team. The season is young yet for this sport as well as basket ball but when the time arrives teams will be in good shape.

There are also wrestlers within the ranks. The home of the famous Strangler Lewis is at Nekoosa, and some of his first matches were with Dave Sharkey, pipe fitter foreman of the Port Edwards mill.

Two exhibition matches have been staged the past week by Strangler Lewis, one at Nekoosa, the other at Port Edwards. Dave Sharkey again toppled with the world's champion at the Port Edwards match and Dave gave the champ a stiff workout for a while. Most of the employes who were not on duty turned out to see these matches.

Many other winter sports will be resorted to when Jack Frost covers the ground and it is the intention of the management of company to provide good sport when the boys are not at work or in the Industrial Education school, which is very popular and for which the men are very appreciative.

The South as a Paper Center

"The southern states will be the paper producing states in the future," writes R. H. Laftman, assistant general manager of the Bogalusa Paper Co., Inc., of Bogalusa, La., in a letter in reply to an inquiry regarding the progress of kraft paper manufacturing in the South.

"In 1912, when I came South and the mill at Moss Point, Miss., was constructed," continues Mr. Laftman, "there were only about thirty tons of kraft paper made in Dixie. Today we have a productive capacity of somewhere around 600 tons per day. We are right in the midst of the construction of a new mill and there is no telling what our capacity will be in the next two or three years.

"I have just returned from a trip through the western part of Louisiana, where I visited the Bastrop Pulp and Paper company at Bastrop, which is producing about 30 tons of kraft per day on their 144 inch trim machine. They are making a good sheet and have a fine mill.

"The Brown company, of Orange, Texas, have started construction work on there new plant at West Monroe, La., but I do not think they will get in operation before the latter part of next year.

"The Industrial Lumber company, at Elizabeth, La., have started to manufacture kraft paper and will have a capacity of about 30 tons per day.

"'The Southern Paper company, of Moss Point, Miss., is installing a 144 inch trim machine, and will get in operation about the same time our new mill is ready—about May of next year."

Forestry in the Paper Industry

Conducted by J. R. Simmons, Secretary Forester,
The New York State Forestry Association

Final Session of Senate Committee

Chairman R. S. Kellogg of National Forestry Program Committee Sums Up Situation and Suggests Scope of Plan

The final session of the United States Senate committee on reforestation for the taking of testimony was held at Washington, D. C., November 22 and 23, and was marked by a general summing up of the situation in behalf of the National Forestry Program Committee by its chairman, R. S. Kellogg, secretary of the Newsprint Service Bureau.

The National Forestry Program committee, formed in 1920 by the American Paper and Pulp Association as the moving spirit in the effort to unite great American industries in support of a rational forestry program, includes the National Lumber Manufacturers Association, the Association of Wood Using Industries, the American Newspaper Publishers Association, the Society For Protection of New Hampshire Forests, the American Forestry Association, the American Tree Association and the Western Forestry and Conservation Association.

This committee's activities really gave momentum to the national movement for a general forestry policy, and its representatives have been heard at various sessions of the United States Senate committee. In the west, for instance, E. T. Allen appeared before the committee; in the east, Dr. Hugh P. Baker appeared by request at the opening meeting in Washington, and again as representative of the paper industry at Bangor, Maine; finally, at the closing session in Washington, Mr. Kellogg summed up the entire situation as it has been viewed by the National Forestry Program Committee.

Kellogg Summarizes Adequate Plan

Mr. Kellogg said that the Senate Committee hearings have demonstrated in the weight of evidence submitted from coast to coast that any adequate plan for the maintenance of our timber supply must include:

Effective fire prevention on both public and private forest land.

Scientific utilization of forest products.

Forest planting upon large areas of public land.

A substantial proportion of well-distributed forest land in public ownership upon which there may be grown the older classes and larger sizes of timber which we cannot expect in sufficient quantity from private initiative.

It is futile to think of depending upon foreign sources for any considerable future supply of wood products. We must grow more timber at home or alter the entire plan of American life and industry.

It is helpful to state a few truths as to the methods of forestry:

Forestry is not a law compelling the planting of a new tree for every one cut.

Forestry is not a law limiting the cut to certain sizes and kinds of trees.

Forestry is not arbitrary control by any public body over the operations of private enterprise.

Forestry is not fire prevention—though this is everywhere necessary.

Forestry is the application of definite scientific principles to the growing and using of timber crops.

Forestry is and must be practiced by Government upon public property in order to insure some supply of forest products for the people.

Because of the long time investment and comparatively small return thereon, together with hazards of fire, insect, fungus and storm, a considerable area of publicly owned forest will always be needed although public ownership of the entire forest area of any country is neither necessary nor desirable.

The proportion of total forest area in public ownership of some form in the leading European countries in the practice of forestry is 35% in France, 53% in Germany and 24% in Sweden. Private capital engages in the growing of timber and cooperates with the public authorities in so doing in those countries, because capital gets a fair return therefor.

Forestry is and will be practiced by the private owner in the United States when he can see that it will pay him to do so.

Since the larger proportion of the forest area of the United States is likely always to be in private ownership, any adequate forestry program must include measures which will promote permanent timber production on such land.

Any practical solution of the problem of continuous forest production must be based upon the principle of Federal leadership and cooperation with the States and timber land owners.

The Ultimate Program

The ultimate program must include:

1. The determination for each forest region of the essential requirements for the maintenance of forest productivity.
2. Sufficient national appropriations to be expended in co-operation with State and other agencies to make such requirements effective.
3. A survey of forest resources and land classification to determine:
   What timber we have
   How much we need
   How much can be grown
4. Provision for extensive research into problems of timber growth and utilization.
5. Forest planting upon a large scale, by both Federal and State agencies.
6. The divising of better methods of forest taxation and their adoption by the States.
7. The continual building up of publicly administered forests through purchase, exchange, transfer from the public domain and the several forms of public reservation until 40% of the ultimate forest area of the United States is permanently devoted to timber growing or watershed protection under public control.

At present 20% of the forest area of the United States is publicly owned, but the situation is badly unbalanced. From the Rocky Mountains West, 70% is in public ownership and from the Rockies East, but 3%.

The Immediate Program

The immediate program should include:

1. A Federal appropriation of not less than $1,000,000. yearly for co-operation with the States in fire prevention, the National Government to spend no more for this purpose in any State than the State itself spends therefor, including the expenditures of forest owners required by State law.
2. A Federal appropriation of $5,000,000. yearly for the purchase of forest land upon the watersheds of navigable streams.
3. A Federal appropriation of $1,000,000. yearly for forest research and investigation, including studies in forest taxation.
4. An initial Federal appropriation of $100,000. yearly for forest planting in cooperation with the States and otherwise with provision for increases up to a total of $1,000,000. yearly within 10 years as planting facilties and forest protective measures are improved.
5. A relatively small initial appropriation with reasonable yearly increases for co-operation with the owners of forest land, similar to the present appropriations for cooperation with the owners of farm land. The Secretary of Agriculture recommends $50,000. to start this work.
6. Authorization for determination by the Secretary of Agriculture of what lands, owned by the United States and not now embraced in National Forests or National Parks, are valuable chiefly for the production of timber or the protection of watersheds and provision for their ultimate inclusion within the National Forests or such other protection and administration as will promote their best use in the public interest.

None of these items can be rightly charged to the national expense account. They are investments in the future and permanent welfare of the country—an insurance upon one of our greatest and most necessary natural resources.

A New Northeast Experiment Station

An important statement on the purpose of the new Northeastern Forest Experiment Station at Amherst, Mass., was given by its director, S. T. Dana, at the last meeting of the New York section, Society of American Foresters.

This station which will, more than any other of the forest service stations, study problems of the paper industry's timber supply, was established at Amherst, Mass., because the forest service considered it advisable to tie up the Forest Experiment Station with the Agricultural Experiment Station for the better handling of utilization work. Amherst also is centrally located and meets necessary requirements for the Adirondacks in New York, the Green mountains in Vermont, the White mountains in New Hampshire and the extensive area of Maine. The station will develop a form of cooperation similar to the Madison, Wis., station, but will also cooperate with all agencies.

Mr. Dana requested the advice and suggestion of the New York section in relation to a plan for organization of a Forest Research Council in the Northeast. It was his idea to have the experiment station engage one of its agents in obtaining information on forestry projects and lay such information before the council. The council itself would act as a clearing house, advise where duplication of effort exists, round out a program of efficient work, and be advisory in relation to all organized activities in forest research.

The method suggested for getting the council under way was as follows:

The New York and New England sections of the society should take the leadership; they should suggest the council members, taking care that all of the various agencies be represented. There should perhaps be frequent changes in the make-up of the council brought about through short terms of office for convenience in obtaining representation of the different interests.

Some of the interests concerned in the council should be the following: The State Forestry departments, the schools, the agricultural stations, the lumber and pulp companies, and so on.

Mr. Dana's address was followed by general discussion during which the following points were brought forward: (1) If council can cooperate with the experiment station without formality its work will be effective, otherwise it would be better for the experiment station to have a free hand. (2) There is a certain psychology in the idea of a council—the interests concerned would be grateful for the privilege of making suggestions to the experiment station and would take pride in extending their cooperation. (3) Recognition for the station as an important part of the forestry effort of the region would be more general as a result of the work of the council. (4) Appropriations would be more easily obtained as a result of the assistance of the council.

The section endorsed the idea of an advisory council.

To Fight Southern Pine Beetle

The appearance of the southern pine beetle in various portions of the South is followed by the offer of assistance in fighting this pest by the Bureau of Entomology of the Department of Agriculture.

This beetle at times finds conditions ripe for its rapid multiplication, and unless care is taken the pest may spread widely. Cutting the infested trees will aid in the fight against the spread of the pest, and the timber can at the same time be saved.

The Bureau of Entomology offers to send men into the South where the insect is reported and advise the owners as to what trees should be cut and what other steps are necessary to prevent the spread of the insect to untouched areas.

The damage has been felt in many states, including Virginia, West Virginia, the Carolinas, Georgia, Alabama, Mississippi, Louisiana, Texas and Florida. The range of the beetle is further north and south than at any time since 1893.

Governor Pinchot Suggests a Lumber Tax

In searching for a way to force timberland owners to handle their timber operations in conformity with forestry ideals, Governor Pinchot of Pennsylvania has offered to the U. S. Senate Committee on Reforestation the suggestion that all lumber be taxed, and the proceeds from this tax be used to pay a bonus to those lumbermen who operate scientifically.

He urges that the tax laws be thus used to aid the man who handles his lands with a view to future production. and to penalize the man who handles his land otherwise.

He made this suggestion at the Harrisburg hearing of the Senate committee, just prior to the final session in Washington.

Vol. XXXIII December 6, 1923 No. 6

Paper Industries Exchange Closed

At a meeting in the offices of the Robert Gair company at 350 Madison avenue, New York, on November 22, the Board of Directors of the Paper Industries Exchange voted to close the exchange both in Chicago and New York on December 1.

This news came as a distinct surprise in the trade. No one, perhaps aside from those in very close touch with the exchange, had any inkling that such action was contemplated, as it was understood that the group of board manufacturers who had organized the exchange was entirely satisfied with the results achieved by the operation of the exchange since it was opened in Chicago about three months ago, and in New York City approximately six weeks later.

It was found, however, according to information secured following the announcement that the Exchange would be dissolved and its operations discontinued, that those members of the box board manufacturing industry who were behind the exchange had become somewhat discouraged because they were not able to enlist the co-operation of a good many board mills in the proposition. The Exchange membership comprised about 50 per cent. of the box board manufacturers of the United States, and it was realized that in order to make the trading body a complete success it would be necessary to have at least 80 per cent. of the board mills as members. Finding that it would be difficult to induce this, many board manufacturers to join, it was decided on the suggestion of some of the members to close the exchange and to organize a new board manufacturers' association along the orthodox lines of the usual trade organization.

George A. Gair, president of the Paper Industries Exchange, and president of the Robert Gair company, who was one of the prime movers in organizing the exchange, stated that it was deemed advisable to close the exchange rather than attempt to conduct the trading body with only about half the board manufacturers of the country co-operating in its functioning. In officially announcing the closing of the exchange, Mr. Gair said:

"It is the belief of those who proposed the exchange and who lent their efforts to establish it in New York and Chicago that the idea of an exchange in the paper, board and paper stock industry was introduced a little too early; that the industry was not ripe for this method of doing business just yet. Of course, we had no way of telling this beforehand, and we felt that once the exchange was established, and paper and board manufacturers and suppliers of raw material to these mills were acquainted with the benefits to be derived from an exchange they would all readily become members."

"However, we learned that many in the industry were not in favor of the exchange system of trading although operations on the exchange both in New York and Chicago—particularly in the latter city—met with what we considered a fair degree of success. We feel confident that the exchange idea will be revived in this industry in the not distant future, and that in time a Paper Industries Exchange will be established which will perform a great service to the industry at large and to its individual members."

Trading on the exchange in New York was discontinued on November 23. Once the news that the Exchange would be closed leaked out, traders failed to make an appearance in the exchange room in the Pershing Square building, 100 East Forty-second street, in this city, and no transactions were recorded after that date. Trading continued on the Chicago Exchange, however, until November 30, with a fairly large volume of business consummated in waste paper during the final week.

In the place of the Paper Industries Exchange, box board manufacturers plan the organization of a new trade association to be known as the Board Manufacturers' association. This body, it is intended, will perform the usual services of a trade organization, and will continue the statistical service of the exchange. A meeting is scheduled to be held in Chicago on December 10 at which the new association will be formed.

Thanksgiving Day Shutdown

The officers of the Nekoosa Edwards Paper company at Port Edwards, Wis., arranged for the shut down of all its mills on Thanksgiving Day which is the first time in their history that they have shut down other than 4th of July and Christmas.

This is the first shut down for the year of 1923 and while other mills in Wisconsin have had one or more machines down for a considerable period, business has been good with the mills at Port Edwards and Nekoosa.

The shut down continued through the week starting Thursday morning and gave many a chance to get a few days rest. The weather is good—the best Fall of record for many years and the roads fine in all directions.

It was hoped that the resumption of operations Monday, December 3rd, would find conditions so improved that no further shut down this year or winter will be necessary.

New Finishing Room for Marinette Mill

Ever since the installation of number three and four machines at the Marinette plant of the Marinette and Menominee Paper company, the need of a larger finishing room has been felt and finally decided upon.

Work is now being rush on the new building, which will be 210 feet long by 50 feet wide, consisting of basement and one story, of steel and concrete construction.

This is all being done by the company's own men under the supervision of D. G. Moon, the company's construction engineer, and is expected to be ready by January first.

The Rockingham Paper Co. has been incorporated in Rockingham, N. C., with a capital of $75,000, and will erect a plant with a capacity of eight to ten tons of paper per day. H. C. Wall is president, and F. L. McCall is secretary and treasurer.

Construction News

Kalamazoo, Mich.—The Kalamazoo Vegetable Parchment Co., River road, has plans in preparation for the erection of a new one-story plant addition, 100x200 ft., estimated to cost about $85,000. Billingham & Cobb, Press building, are architects.

Appleton, Wis.—The Riverside Fiber & Paper Co., is planning for the installation of a new filtration plant, estimated to cost $50,000. Work is in progress on enlargements and improvements in the mills, including the installation of additional equipment, estimated to cost $400,000.

Manchester, Conn.—The Rogers Paper Mfg. Co., has commenced improvements at its West mill on Charter Oak Street, to include the installation of a new circulating system, for which a contract has been awarded to the J. O. Ross Engineering Corporation, New York.

Bruce, Wis.—The Chippewa River Power & Fibre Co., has disposed of its power rights between Bruce and Radisson, Wis., to the Byllesby Engineering & Management Corporation, Chicago, operating electric utilities in this section, which purposes to use the property in the near future for hydro-electric power construction.

Anacortes, Wash.—The Consolidated Paper Co., has tentative plans under consideration for the construction of a new paper mill, estimated to cost in excess of $100,000.

Royalton, Minn.—The Pike Rapids Power Co., St. Cloud, Minn., has plans for the construction of a new hydro-electric power plant at Blanchard Rapids, Mississippi river, near Royalton, with initial output of 24,000 kw. to be used primarily for paper mill service in this section.

Port Huron, Mich.—The Dunn Sulphite & Paper Co., Detroit, Mich., has acquired a local tract of land on the St. Clair river, as a site for the construction of a new pulp and paper mill. It will consist of a main unit and auxiliary structures, with power house and machine shop, and is estimated to cost approximately $500,000, with equipment. It is purposed to complete plans at an early date.

Dayton, Ohio—The Elam Paper Co., Marion, Ind., will soon lay foundations for its proposed new two-story mill on local site. It will total about 70,000 sq. ft. of floor area. The company proposes to remove its Marion plant to this location, and install additional equipment for increased output.

Three Rivers, Mich.—The Eddy Paper Corporation, has purchased a tract of property in the vicinity of its local mills Nos. 1 and 3, for future expansion. This makes a total of 23 acres now being held in this section for reserves by the company.

Chicago, Ill.—The Meyercord Co., 5339 West Lake Street, manufacturer of paper decalmanies, etc., has awarded a general contract to F. G. Bear, 19 South La Salle Street, for the erection of an addition to its plant on West Lake Street, to be 110x155 ft., estimated to cost $200,000, including machinery. J. Floto, 53 West Jackson Boulevard, is architect.

Indianapolis, Ind.—The Hoosier Paper Specialty Co., will operate a new local works at 1115 South Meridan Street.

Ballston Spa., N. Y.—The Saratoga County Paper Co., Inc., manufacturer of boxboard, etc., contemplates the installation of additional equipment, including four beaters and auxiliary apparatus. Purchases will likely be made early in the coming spring. F. A. Talbot, Jr., is treasurer.

Paterson, N. J.—The Van Ness Paper Box Co., 104 Gray street, has completed plans for the erection of a new one-story addition, 40x140 feet, estimated to cost $25,000. J. C. Van Vlandern, 140 Market street, is architect.

Levis, Que.—L. N. Haurd, 129 Commerciale street, is at the head of a project to construct and operate a paper and pulp mill in this section, to be used primarily for the production of newsprint, estimated to cost $1,500,000. A site has been selected on the Megiscane river in Temiscaminque county. The same interests propose to construct a hydro-electric generating plant in this same district, with initial capacity of about 15,000 hp.

New Orleans, La.—The Seinzhenier Paper Co., is planning for the reconstruction of its building on St. Peters street, recently destroyed by fire with loss of about $100,000, including equipment. The new structure will cost approximately a like amount.

Smooth Rock Falls, Ont.—The Mattafma Pulp & Paper Co., Ltd., is planning for the installation of equipment for the production of unbleached sulphite pulp, in connection with proposed expansion.

Arlington Heights, Ohio—The Arlington Heights Paper Co. has awarded a general contract to the Ferro Concrete Construction Co., Cincinnati, for the erection of a one-story addition.

Hickory, N. C.—The Hickory Paper Box Co. has acquired a local site and plans for the erection of a new plant. Details will be arranged at an early date.

Tomahawk, Wis.—The Tomahawk Kraft Paper Co. will commence the erection of a new addition to its mill to be equipped as a digester building. It is estimated to cost about $85,000.

Kingsport, Tenn.—The Mead Fibre Co. is pushing construction on a new local mill to be used for the manufacture of magazine and book papers, and plans to have the plant ready for operation at an early date. It will cost in excess of $225,000, with machinery.

Muskegon, Mich.—The Central Paper Co. is completing the construction of a new mill addition, and will inaugurate production at an early date. It will provide for extensive increase in output.

Chicago, Ill.—The Western Bag & Paper Co. has filed plans and will commence the immediate erection of a new two-story works at Sixty-fourth street and Wentworth avenue, to be 60x100 feet, estimated to cost close to $50,000.

New York, N. Y.—Fire recently damaged a portion of the plant of the Newland Paper Box Co., 103-5 Greene street. The estimated loss has not been announced. The damaged will be replaced.

Hopewell, Va.—The Hummel-Ross Fiber Co. has work nearing completion on its new local pulp and paper mill, and plans to place the unit in service on a capacity basis at an early date.

New Companies

Brooklyn, N. Y.—R. A. Bonime, Inc., has been incorporated with a capital of $100,000, to manufacture paper boxes and containers. The incorporators are D. Kraus, F. Frasch and R. Margolies. The company is represented by Gordon, Tally & Gordon, 347 Fifth Avenue, New York.

Perth Amboy, N. J.—The G. M. Agreen Co., has been incorporated with a capital of $50,000, to manufacture and deal in paper products. The incorporators are Gustave M. Agreen and Edward Lembcke, both of Perth Amboy.

Buffalo, N. Y.—The Buffalo Envelope Co., has been incorporated with a capital of $200,000, to manufacture paper specialties. The incorporators are F. McB. and A. M. Dorris, and L. G. Reineman. The company is represented by F. J. Knorr, attorney, Albany, N. Y.

Indianapolis, Ind.—The Indiana Paper Co., has been incorporated with a capital of $125,000, to deal in paper products. The incorporators are Fred J., Harry C., and Elmer H. Ostermeyer, all of Indianapolis.

Wilmington, Del.—The Blanche Brothers Envelope Co., has been incorporated with a capital of $25,000, to manufacture and deal in paper specialties. The company is represented by the Colonial Charter Co., Ford building, Wilmington.

New York, N. Y.—H. B. Wadsworth, Inc. has been incorporated with a capital of 100 shares of stock, no par value, to manufacture paper products. The incorporators are E. Stern, M. Lieberman and S. Reitberg. The company is represented by Boskey, Schiller & Sterling, Bar building, New York.

St. Charles, Ill.—The St. Charles Paper Box Co. has been incorporated with a capital of $25,000, to manufacture paper boxes and containers. The incorporators are Louis Rockwell, J. W. Chaffee and Harry G. Hempstead, 22 East Main street, St. Charles. The last noted represents the company.

Brooklyn, N. Y.—The Amherst Paper Co. has been incorporated with a capital of $20,000, to manufacture and deal in paper products. The incorporators are C. Littlefield and W. Matthews. The company is represented by J. J. Hegt, 126 Liberty street, New York.

Wilmington, Del.—The Acme Paper Board Co. has been chartered under state laws with capital of $2,100,000, to manufacture paper and pulp products. The company is represented by the Corporation Service Co., Equitable building, Wilmington.

Jersey City, N. J.—The New York Folding Box Co., 8 Bates street, has filed notice of organization to manufacture and deal in paper boxes. The company is headed by Harry Kaplan, 85 Van Winkle avenue, Jersey City.

Financial

New York, N. Y.—The American Paper Forming Co., 152 West Forty-second Street, a Delaware corporation, has arranged for an increase in capital from $350,000 to $650,000, for expansion.

New York, N. Y.—An involuntary petition in bankruptcy has been filed against the Freedom Paper Co., 121 Sullivan Street. The liabilities are stated to be about $90,000, and the assets, $70,000. James S. Wemyss has been appointed receiver.

Detroit, Mich.—The collector of customs has been advised by the Treasury department, Washington, D. C., that the proper rate of duty on woolen paper machine endless felts is 7½ cents per pound. The department, it is pointed out, concurs in the practice at the Port of New York in assessing the duty on this commodity as woolen rags, under paragraph 1105 of the Tariff act.

Phillipsburg, N. J.—The receivership recently appointed for the Durham Pulp & Paper Corporation, with local mill and branch plants in a number of places, has been dismissed by Federal Judge Lynch. The company's assets are estimated at $2,000,000, and liabilities at $1,000,000.

Reading, Pa.—A case is under way in the local court to decide the possession of the plant and business of the Doty & Scrimgeour Co., 319 River street, manufacturer of paper products, now in receivership.

Plant Operations

The International Paper Co., New York, has resumed operations on a capacity basis at its plant at Glens Falls, N. Y., for the first time since last July. Recently, the mill has been running on a three-day week basis. It is proposed to continue on the full operation basis for an indefinite period.

Paper box manufacturing plants at Buffalo, N. Y., are maintaining operations on a capacity basis and practically every factory of this kind in the city has booked orders to insure a continuance on this schedule for some time to come. Normal business for this time of year has been exceeded, it is stated, in a number of instances, running as high as 25 percent in advance of regular sales. The call is for boxes and containers of all kinds and no one variety is taking a pronounced lead over others.

Paper manufacturers at Philadelphia, Pa., are operating at about 75 percent of normal capacity, and fall business, it is stated, has come below the general average expected. The demand, however, is noticeably increasing, and a number of mills expect to advance the present basis of operation in the near future.

Election of Officers for 1924

Ferris J. Meigs was reelected president of the Empire State Forest Products Association for 1924, with W. L. Sykes of Conifer, N. Y., vice-president. The directors include Geo. N. Ostrander of Glen Falls, E. A. Sterling of New York City, T. H. Stirling of Mechanicsville, J. N. Carlisle of Watertown, W. C. Hull of Tupper Lake and C. L. Fisher of Lyons Falls.

While enjoying a game of golf in Montreal a few days ago, T. P. Howard, comptroller of the Howard Smith Paper Mills and general manager of the Phoenix Bridge and Iron Works, was seized with a violent illness which nearly caused complete collapse. Although still under treatment Mr. Howard is considered out of danger. He is a cousin of C. Howard Smith, head of the organization.

Improvements in Fine Papermaking

(Continued from page 4)

many years ago that prices were estimated by some rule-of-thumb method; when rags were put through on a guessed cost and when a convincing argument in the mill might change costs and figures. Mills that have installed good systems have since ascertained that certain grades which seemed to bring in a fair return were really sold at a great loss, while seemingly poor priced papers were bearing the stockholders' dividend burden.

One method of estimating costs years ago was to take the price of a rag and multiply it by a number. If at the end of a period the profit and loss statement did not come up to expectation this number was changed. When cost systems began to multiply mill men started working on how to keep the quality and still sell paper at a lower price. Cost systems, among other things, give the value per unit of each process for comparison and impress the advisability of trying to lower costs in the different departments.

We may note in passing that improvements are being made in the use of liquid chlorine for bleaching, wire guides, press rolls, oil feeding to machine bearings, handling of materials, machine hoods, mill ventilation, temperature control, and others too numerous to mention. The boiler plant comes in for its share.

Enclosing steam dryers to recover heat was proposed at the Appleton convention in October and the trade journals are carrying advertisements showing devices for putting on a machine wire in an hour, which is convincing proof of the fact that the industry is progressing and will continue to advance in the future.

John C. Schmidt

Following an operation at St. Luke's hospital in New York City, John C. Schmidt, president of the Schmidt & Ault Paper Co., died November 15 at the age of 64 years.

Mr. Schmidt had been in failing health for several weeks but was able to be about his home at York, Pa. His ailment was not definitely diagnosed until early in November, when an operation was declared necessary.

Surviving him are his wife, Mr. Anna M. S. Schmidt; one son, Henry D. Schmidt of York; two daughters, Mrs. Luther Eisenhart of Princeton, N. J., and Miss Mary D. Schmidt of York; one brother ,George S. Schmidt, attorney of York; one sister, Mrs. Mary Parrot of New York City, and two grandchildren.

Lewis Hallock Nash

Announcement of the death of its president is being sent out by the Nash Engineering Company, of South Norwalk, Conn.

The death of Mr. Nash occurred November 17th and its announcement will be received with great regret and sorrow by the paper industry, in which he was well known and greatly esteemed.

Northwest Superintendents Active

A committee of the Northwest division of the Superintendents Association met at the Whiting hotel, Stevens Point, Wis., on Sunday, November 18th, to consider location for the next spring meeting.

Those present were: L. E. Smith, chairman, Nekoosa; A. G. Stone, vice chairman, Marinette; Wm. Kraske, secretary, Wisconsin Rapids, Wis.; J. H. Slater, Escanaba, Mich.; F. C. Boyce, Brokaw, Wis.; John Adams, Stevens Point; D. B. Davies, Green Bay; B. T. McBain, Port Edwards.

The committee selected Marinette, Wis., for the next convention and set the dates as Friday and Saturday, May 2 and 3, 1924.

A. G. Stone of Marinette and Menominee Paper Co., Marinette, Wis., was appointed chairman of the committee of arrangements and requested to name his own assistants for appointment by the chairman.

The officers were appointed for the program committee.

Arrangements will be made to visit mills at Shawano, Peshtigo, Oconto and Marinette in Wisconsin; Menominee and Escanaba in Michigan.

A committee was appointed consisting of Chairman Smith, Slater and McBain to arrange and report regarding the 1924 Fall convention to see if Beloit and Madison, Wis., would be desirable places, the former on account of the paper machinery plant of Beloit Iron Works and the latter on account of the Forest Products Laboratory and State capital.

When a Canadian Pacific freight train was ditched at Woodstock, Ont., a large quantity of newsprint paper was destroyed. Many rolls of the paper and a quantity of printing machinery were smashed up and some of it dumped in a plowed field near the road bed.

BUREAU OF CANADIAN INFORMATION

The Canadian Pacific Railway through its Bureau of Canadian Information, will furnish you with the latest reliable information on every phase of industrial and agricultural development in Canada. In the Reference Libraries maintained at Chicago, New York and Montreal are complete data on natural resources, climate, labor, transportation, business openings, etc., in Canada. Additional data is constantly being added.

DEVELOPMENT BRANCH

If you are considering the establishment of your industry in Canada, either to develop Canadian business or export trade, you are invited to consult this Branch. An expert staff is maintained to acquire and investigate information relative to Canadian industrial raw materials. Information as to such raw materials as well as upon any practical problem affecting the establishment of your industry, including markets, competition, labor costs, power, fuel, etc., is available.

No charge or obligation attached to the above service. Business men and organizations are invited to make use of it.

New York Headquarters for Paper

TO those leading manufacturers and selling representatives who maintain their New York offices and salesrooms in The Fifth Avenue Building and with whom, as tenants, we have the good fortune to be associated, we extend the season's greetings. It is our wish and belief that 1924 will be, for them, a Happy and Prosperous Year.

Riordan to Be Liquidated

The Riordon Company has gone into liquidation. This does not mean that the plan or reorganization on which those interested have been working for some time will not be carried through. On the other hand, it is said that liquidation was a step that would have to be taken anyway prior to reorganization. It was hastened by the fact that the time extension granted by the creditors expired November 19, and that under the Bankruptcy act, as amended, further extension was impossible.

In order that the receivership might be a friendly one, the bondholders themselves took the step that placed the company in liquidation. Gordon W. Scott of P. S. Ross & Sons, Montreal, was appointed provisional liquidator.

An agreement has been arrived at between the reorganization manager and the committee representing the first mortgage to bondholders, subject to the approval of the latter on December 6th.. Under the reorganization it had been proposed to pay these bondholders at least $1,500,000 in cash for their past due interest and interest up to June, 1924. The committee has now agreed to accept second preferred stock in lieu of cash. This saving of $1,500,000 will give the company a working capital of $6,000,000, and the arrangement generally is believed to have removed the last important obstacle to the carrying out of the reorganization.

It is now proposed to go ahead with the development of the Chelsea, Ore., power scheme within six miles of Ottawa, which will increase Riordon's earning power. The plants of the company are working to capacity.

It is understood that the Chesea scheme, which is to be carried on under the Gatineau Power company, it to have the same capacity as that of Laurentide Power. It is understood also that already financial houses have undertaken to provide the money required. The common stock of Gatineau Power will be held by the Riordan company.

October Pulp and Paper Exports

According to the report issued by the Canadian Pulp and Paper association the total value of the exports of pulp and paper in October was $12,289,952, an increase of $574,083 over the total for September and of $1,884,519 over October 1922.

Details for the various grades of pulp and paper are given below:

	October 1923 Cwts.	October 1923 Value	October 1922 Cwts.	October 1922 Value
PAPER:				
Newsprint	2,014,438	$7,505,041	1,631,042	$5,811,954
Book Paper	4,307	34,415	6,983	49,035
Other Paper and Mnfrs.		632,029		607,977
		$8,171,485		$6,468,966
PULP:				
Sulphate	277,413	$ 903,974	281,777	$ 875,876
Sulphite Bleached	216,685	871,873	361,497	1,432,687
Sulphite Unbleached	386,750	1,061,432	368,215	885,601
Mechanical	699,836	1,281,188	528,705	742,303
	1,580.664	$4,118,467	1,540,194	$3,936,467

The distribution of these exports in October was as follows:

To:	Paper	Pulp	Total
U. S. A.	$7,491,691	$3,526,828	$11,078,519
United Kingdom	143,129	351,711	494,840
All Other	536,665	179,928	716,593
	$8,171,485	$4,118,467	$12,289,952

Pulpwood exports in October amounted to 102,138 cords valued at $1,078,707, this was a decline from the previous month when the amount exported was 112,366 cords valued at $1,172,814. There has been a large increase in pulpwood exports for this year compared with the last two or three years.

In the first ten months of this year there were exported 1,260,871 cords compared with 860,936 cords in the same months last year.

For the twelve months ending October 31st, 1923, there has been a considerable increase in the exports of pulp and paper over the figures for the previous twelve months. A glance at the table given below shows that this increase has taken place in practically every grade of pulp and paper. In the case of sulphate pulp while the actual quantity exported has been slightly less the value was greater, denoting better prices. The values for total pulp and total paper are well above the totals for the previous twelve months.

Details for the principal grades are as follows:

	12 Mos. to Oct. 31-1923 Tons	12 Mos. to Oct. 31-1923 Value	12 Mos. to Oct. 31-1922 Tons	12 Mos. to Oct. 31-1922 Value
Newsprint	1,119,981	$83,644,006	919,192	$66,549,354
Book Paper (cwts)	46,778	341,772	29,019	211,332
Bond & Writing (cwts)	22,062	233,600	12,125	125,903
Kraft & Wrapping	19,972	2,972,090	17,304	2,623,371
Mechanical Pulp	346,290	$11,498,029	324,799	$ 9,593,181
Sulphite Blchd	156,263	13,489,992	144,828	11,735,152
Sulphite Unblchd	237,518	12,605,676	205,321	10,682,751
Sulphate	147,201	9,568,028	149,166	9,133,797
Total Paper		$91,446,279		$72,822,828
Total Pulp		47,161,725		41,142,881

May Prohibit Spruce Export

Chairman Picard of the Canadian Pulp Wood commission says that whatever might be the decision of the commission on the question of the placing of a general embargo on exports of pulp wood, at least a recommendation will have to be made for the placing of it on certain varieties of timber, notably spruce, nor does he think that it would be strongly opposed by such timber holders.

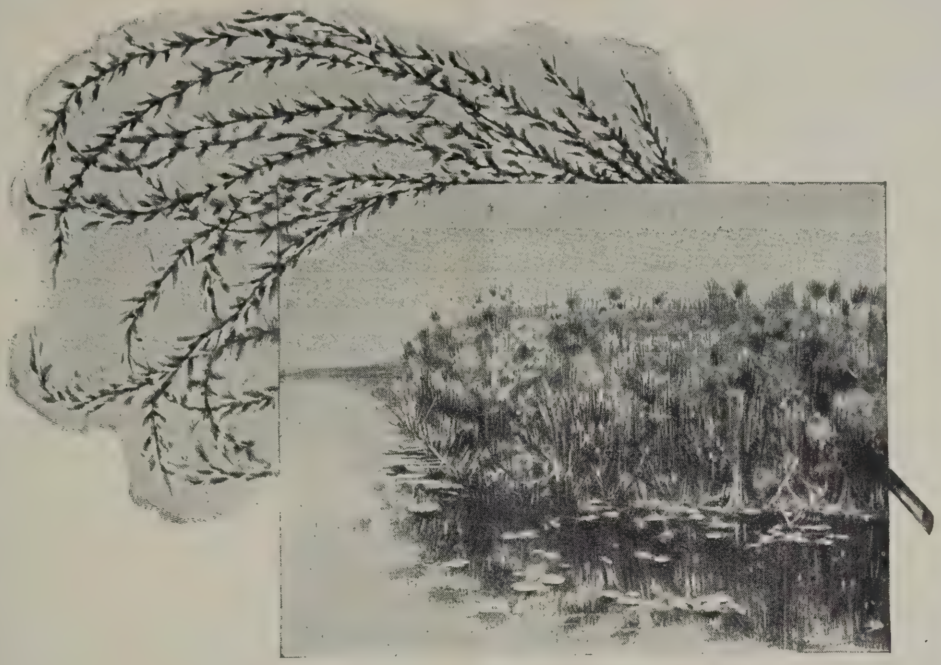
At the Toronto sittings, he threw out the suggestion that it might be advisable to place an export tax on shipments of pulp wood going out of the country, but this has not been received with favor.

His statement respecting an embargo on exports of spruce is important, for while he may not have spoken officially for the Commission still due weight must be given to his opinion as chairman.

Favors Notice of Embargo

An alternative to an immediate embargo on the exportation of pulpwood from Canada which aroused the interest of the commission in session in Toronto, was put forward by A. H. Howard, pulp buyer and operator of South River, Parry Sound district, Ont.

Mr. Howard suggested that the United States mills should be given two or three's years' notice if the Dominion decides in favor of an embargo. That delay, he said, would give the United States mills an opportunity to establish plants on this side of the line and establishment of these mills would do much to alleviate the difficulties which he feared would confront the settlers if an embargo were made effective immediately.



Papyrus, as it still grows along the Nile. In the background a photograph of a stalk of the plant, (about one-third actual size.)

Paper's Ancestor

Paper was used for kings only, in the days when the Nile's deposit of silt supported the world's greatest civilization. Skilled workmen, slaves, turned reeds into reading matter.

The average business man throws more paper into his waste basket in an average business day than a deified Pharaoh owned in his whole reign. And paper today is a better product than the best the Egyptian paper maker could boast.

Skilled men, choosing their own vocation and proud of it, meet today's paper needs with a product as good as it is plentiful.

Hammermill Paper Company

Doings in Canadian Paper Field

Interest in Daily News Mill

While the question of an embargo on the export of pulpwood is being discussed, construction is going ahead on the Daily News Corporation's plant at North Tonawanda, N. Y. This plant intends to produce paper from poplar and birch from the north shore of the Gulf of St. Lawrence, which will be carried to the plant on the company's own steamers.

There has been a considerable amount of interest concerning this new paper development in Canada because of the fact that it has been located in the United States just across the border from Canada and not far from the paper mills of the Chicago Tribune at Thorold. Both plants are owned by the same people, the Patterson-McCormick group, which owns the Chicago Tribune and the Daily News of New York City.

The new mill will turn out 60 tons of book paper a day, which will be used in printing the Daily News. On this class of paper there is a duty in the United States, which may account for the mill being located on the American side. In the event of the embargo on the export of pulpwood form Canada, it is possible that the pulp would be manufactured in Canada, either at Thorold, or elsewhere, and turned into the finished paper at the Tonawanda mill.

Rumors of U. S. Control

Will the pulp and paper mills in eastern Canada now controlled by English capital be acquired by United States pulp and paper interests?

Reports that some of the properties will be taken over by United States capital are current. Since the collapse of two of the best known English pulp and paper firms, namely, Charles Marsden and Sons and Beeker and Company, these reports have been given much credence. A receiver was appointed for both of these firms recently, on petition of debenture holders, as represented by the National Provincial and Union Bank of London. Offers are said to have been made for some of the mills owned by Beeker and Company and Charles Marsden and Sons.

The news that Beeker and Company and Charles Marsden and Sons had been petitioned into receivership created consternation in Canada among Canadian pulp and paper men. It had been supposed that both of these companies were in sound financial condition. The failures are attributed to the general trade depression in England. In the words of the receiver, "the business will be carried on by me with a view to reconstruction and it is hoped the creditors will eventually receive payment." The same receiver is acting for both companies.

Becker Tells His Side

Sir Frederick Becker is evidently very sore over some of the recent developments in connection with pulp and paper properties in Canada in which he is interested.

In a statement made in the United Kingdom he said that he and his associates had invested in Canada, in preference and ordinary shares, £1,250,000 actual cash. "It seems," he added, "that this is to be wiped out and our properties acquired by Canadian interests for nothing. We have struggled through a difficult time. We have created the biggest sulphate and mechanical pulp mills in North America, and have reached a time when both enterprises are on a profitable basis. This is the moment to acquire what we have created by a stroke of the pen.

"Becker's made advances to Chicoutime company of $500,000 during the shutdown brought about by an unparalleled drought last winter, raising the sum owed by the Chicoutimi company to nearly £300,000. These advances were made under definite promises of adequate security, but the security had a trick of evaporating in the same way as apparently our interest sand investments are to be made to evaporate, and my endeavors in Canada were frustrated by an unconscionable effort to set off our claims for cash advanced by claims for old delinquencies unproven and largely unprovable."

Progress on Great Lakes Mills

Erection of the huge plant of the Great Lakes Paper company at the western limits of Fort William, Ont., has passed the preparatory stages and actual work is under way on the foundations. With a continuation of good weather the work will be so well advanced by Christmas that it can be carried forward through the winter, as is the present intention.

In the meantime the Hydro commission is carrying forward the work of delivering hydro power. Material is being ordered and some special work is being done on the main line which connects the Cameron Falls development with the head of the lakes.

Steel for the lower yards at the plant of the Great Lakes Paper company at Port Arthur has been ordered. The order is for 10,000 feet, and it is expected that the company will accept delivery of pulpwood this winter. The rails, which will be placed on the ties as soon as received, will also make possible the economical reception of much of the mechanical equipment which is on order for winter delivery.

Wilson Executive of Abitbi

On the shoulders of L. R. Wilson, until now secretary of the Abitibi Power and Paper company, falls the burden of running the big newsprint enterprise.

Alexander T. Smith, head of the Chicago investment firm of Peabody, Houghtaling and company, that has been associated with the financing of Abitibi, Spanish River and other Canadian paper firms, assumes the presidency in succession to the late Frank H. Anson, but the actual executive control will be invested in Mr. Wilson.

Mr. Wilson has been the late Mr. Anson's right hand man and adviser from the start and of late has exercised a large share of the functions that he now officially assumes. Mr. Wilson came to Canadian industrial life after wide experience in the United States. Also, like Mr. Anson, he long since became a Canadian by adoption and naturalization. On the death of Mr. Anson he became that industrial leader's natural successor. W. A. Black, of the Ogilvie Flour Mills, Montreal, has been chosen as vice-president of Abitibi and E. L. Pease, vice-president of the Royal Bank, has been added to the board.

It is announced that California and Iowa capitalists have purchased a saw mill and large timber tracts held by the Prince Rupert Holding company, Limited, the intention being to build a pulp and paper mill in Northern British Columbia.

"EASTCO"
BLEACHED SULPHITE

Using "Eastco" Bleached Sulphite ourselves, testing it day by day, in producing our line of "Eastco" Fine Writing Papers, we have complete control—because we have complete knowledge—of its quality, uniformity and adaptability to the requirements of the paper maker.

"Eastco" Bleached Sulphite is good pulp; it makes good paper. Furnished in Bales, Rolls or Laps as required. Write for Samples and Prices.

Paper and Board

New York, Dec. 4—Demand for most kinds of paper continues spotty to an extreme. Buyers are operating on a reserved scale and seldom show interest in other than supplies for which they have direct need, and while the aggregate movement of paper from mills into consuming channels is of fairly heavy volume, there is at the same time much room for improvement in some branches of the market. Manufacturers are keenly competing for business, and their anxiety to corral all orders that they can, naturally makes for some easiness in prices of certain kinds of paper since concessions are being granted to buyers in some instances to induce them to buy or to wean away orders from competitors.

Another factor of importance in the market is that of foreign competition. It is no secret that large quantities of paper are being imported into the United States at the present time. This applies not only to wrapping paper and newsprint, which have been coming into the country from outside sources in record-breaking volume all this year, but also to other descriptions of paper. For example, some sizable shipments of book paper have recently arrived from abroad, and there have been larger imports than normally of fine papers and fancy papers. The low level of exchange of nearly all the European countries is enabling importers to bring in paper and to market it at lower prices than domestic manufacturers quote. While this competition is chiefly noted in wrapping and print paper, it is also observable to lesser degree in other lines of paper, and tends to unsteady the price situation.

Newsprint continues firm in price and is moving into consumption in tremendous volume. Publishers are using newsprint at a rate never before equalled, and any mill making this class of paper is having no difficulty disposing of its entire output; in fact, about the only trouble experienced by manufacturers is in keeping all their customers fully supplied with paper. That consumption will likely keep up at prevailing levels is indicated by the heavy tonnage publishers are contracting for over the first part of 1924. Contracts lately entered into are said to call for a substantial increase in tonnage over the current year, and everything would seem to forecast another banner year for the newsprint industry in 1924. No change in quoted prices has been noted in any part of the trade but it is quite apparent that manufacturers are holding firmly to their established prices and are refusing flatly to book orders at even a fraction of a cent below the quotational basis of 3.75 cents per pound f.o.b. mills for standard newsprint in rolls.

A little better demand for box board has developed and it is reported that board mills, especially those in the Middle West, are running at larger capacity than they were up to a few days ago. The report of the Box Board Research Bureau shows that board mills in the West operated on an 80 per cent scale during the week ended November 17, when 23 mills reporting to the Bureau made a total of 8,627 tons of board, and booked new business totaling 10,146 tons, while mills in the East ran at a 43 per cent of capacity basis, made 1,807 tons of board during the week and secured new business amounting to 2,479 tons, 15 mills in the East reporting.

Board quotations hold at about $45 a ton f.o.b. New York for plain chip, and $50 for news board. In exceptional cases perhaps these prices are being shaded, but with waste paper stiffening in cost, manufacturers are less disposed to accept orders at reduced prices as their cost of production is on the rise. Board business during the present pre-holiday season has been rather disappoint-

ing but there are pleasing prospects of better times ahead or soon after the turn of the year.

Fine papers are steady in price and it is reported that mills are securing more business than in some time. At any rate, statistics show that manufacturing operations are on the increase. Book paper is moving in a steady manner and in fairly heavy volume, but most mills are still on the lookout for additional orders, not having enough commitments on file to warrant full production. Coarse papers are in moderate demand and quotations are well maintained. Tissue papers have moved freely recently, reflecting the holiday trade. Specialties of most kinds are in good demand, with the price tendency in an upward direction.

Mechanical Pulp

Mechanical pulp is in a steady market position and is provided with a good outlet in consuming quarters. One of the strongest factors in ground wood is that stocks are low, consumers apparently are going along with less than normal amounts in store, while grinders have but limited quantities unsold, demand in recent months having been of such breadth as to absorb practically all the output, especially since production was curtailed by low water. Domestic ground wood is selling at around $42 a ton f.o.b. pulp plants, with quotations ranging several dollars on either side of this level, depending on the air dry test and the freight to consuming points. Canadian producers are securing about $40 a ton at pulp mills for ground wood though some sales at $37 and $38 have been reported in cases where the buyer was situated reasonably close to the grinding plant.

Foreign and Domestic Chemical Pulp

Despite the fact that importations of pulp from Europe have shown a marked increase recently, and notwithstanding that paper manufacturers are buying in a restricted manner, the tone of the chemical pulp market exhibits increased steadiness. The reason for this apparently is that sellers are becoming firmer in their attitude as the winter draws nearer and are less disposed to sell at other than the full prices they quote, feeling that by waiting they will obtain more favorable prices for pulp later on. It is stated that most of the pulp reaching here from foreign sources lately constitutes supplies bought on

Autumn Wedding at Parchment Hall

On this occasion, the first wedding to be formally celebrated by Parchment folks in their Community House, Miss Catherine Hassing of the office staff and Mr. Roy Snyder of the Parchment Division, were united in marriage by the Rev. O. R. Gratton, Community Pastor. After the ceremony, supper was served in the dining room below.

Domestic Rags

The papermaking rag market displays a firming undertone. Prices of low grades as used principally by roofing felt mills have stiffened, and there is an upward trend to quotations on most kinds of new cuttings and of old white rags. Dealers contend that higher prices will be witnessed for nearly all kinds of rags before the winter is far advanced, it being asserted that supplies are not coming in from collection sources in normal amounts and that stocks in Europe are no where near as large as earlier in the year. Roofing rags are selling at 1.45 cents a pound f.o.b. New York for No. 1 grade, and 1.30 cents for No. 2 packing. New No. 1 white shirt cuttings are quoted at 13 cents per pound New York, washables at 5.25 to 5.50 cents, new unbleached muslins at 11.50 cents, fancy shirt cuttings at 6.25 cents, and blue overall cuttings at 8.25 cents. Old thirds and blues are moving well at about 3 cents a pound at shipping points for repacked, and 2.40 to 2.50 cents for miscellaneous packing. Quotations f.o.b. New York are:

BARRE, VT. BOSTON, MASS.

CURRENT MARKETS—Continued

demand for old rope from paper mills, and domestic manila rope of No. 1 quality is selling at 7 to 7.25 cents a pound f.o.b. New York, with sales at the higher figure reported. Old bagging is quiet and roofing bagging has eased off to about 80 cents a hundred pounds f.o.b. New York. No. 1 scrap bagging is quoted at 1.25 cents or less New York. F.o.b. New York prices follow:

Gunny, No. 1	1.25	@	1.40
Foreign	1.25	@	1.35
Wool Tares, heavy .	1.50	@	1.75
Scrap Bagg. No. 1.	1.15	@	1.25
Roofing Bagging ..	.80	@	.90
Wool Tares, light ..	1.25	@	1.50
For. Manila Rope..	6.50	@	6.75
Domestic Rope	7.00	@	7.25
Mixed Strings	1.00	@	1.25

Old Paper

Prices of old paper tend to rise and there have been additional slight advances on some grades. It would appear, however, that the firmer tone is due more to conditions at the supply end than to any appreciable increase in demand, since board mills are buying in a cautious way and in limited volume. Dealers state low prices have greatly diminished collections and that therefore there is much less supply available, thus causing values to harden. No. 1 mixed paper has risen to 60 cents a hundred pounds f.o.b. New York, and folded newspapers to 85 cents New York. Flat magazines are higher, with 1.50 cents per pound New York about the minimum price quoted and with some sales of extra quality packing at 1.75 cents reported. Shavings are quoted at around 3.90 cents New York for No. 1 hard white, and 3 cents for No. 1 soft white shavings. Old kraft paper is firm at 2 to 2.15 cents a pound, and white blank news is freely bringing 2.10 to 2.20 cents New York. F.o.b. New York quotations are:

No. 1 Hard White Shavings	3.85	@	4.00
No. 2 Hard White Shavings	3.00	@	3.25
No. 1 Soft White Shavings	3.00	@	3.10

News, strictly overissue	1.00	@	1.10
Folded News	.85	@	.90
No. 1 Mixed Papers.	.60	@	.65

Twines

Increasing strength in raw materials is making for firmness in twines, and some slight advances in price have been quoted. Jute twines are a cent per pound higher, with papermakers' twine quoted at 11.50 cents a pound. Manila grades also are firm, owing to a stiffening of hemp prices. Quotations are as follows:

Sisal Hay, pure ...	13.25	@	14.25
Manila Hay, pure..	16.25	@	17.25
Sisal Lath Yarn ..	12.25	@	13.25
Manila Rope, pure, ¾ inch diameter .	15.25	@	16.25
Hardware rope	12.25	@	13.25
Jute rope, ¼ diam. and over, coils ..	13.00	@	15.00
Sail twine, A grade.	20.00	@

B. C. Hemp, 18 ...	.39	@	.40
B. C. Hemp, 24 ...	.38	@	.39
B. C. Hemp, 36 ...	.36	@	.37
American Light India— No. 6	19.50	@	
No. 7	18.50	@	

Chemicals

Papermaking chemicals are in fair demand and prices generally hold at last reported levels. Most of the current activity in the markets is against contracts, but transient buyers are doing some operating. Casein is quoted at around 14 cents per pound, duty paid, while bleaching powder is available at 1.40 cents a pound and perhaps at a trifle less.

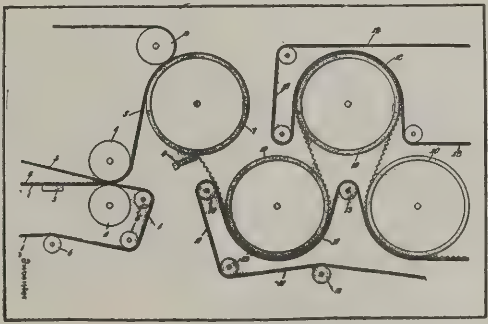
Improved Process of Creping Paper

The Best and Most Profitable

For the manufacture of CREPED PAPER Napkins, Toweling or Stretchable Bag Papers and Creped Packing or Crepe Wrapping Papers the system has no equal



The crepe being formed while the fibres are steaming hot and pliable is dried without stretching; not only retaining form better, but shedding less lint than cold creped paper products.

ORR FELTS and JACKETS

Lowest Cost per Ton

If you judge felt values, not by what you put into the equipment, but what you get out of it—then you will specify ORR 3 stripe Endless Felts for ORR felts will produce the lowest cost per ton. They "stand up" under severe usage. Orr durability is acknowledged everywhere. Their strength and long life are as dependable as their reliability and quality.

In the 32 grades of Felts and Jackets we can match your most exacting demands. Tell us the kind of paper you desire to make, and we will send you samples of felts that will economically serve you and help you to produce paper at lowest cost per ton.

THE PICKLES DRYING REGULATOR

Reasons why you should have it on your machine are: First, it regulates the drying of paper automatically, irregularities are eliminated; second, higher machine finished papers are attainable, because it is possible to maintain the proper quantity of moisture in sheet, as it passes to calenders; third, mills having tried it on one machine have ordered it for all their machines. Full particulars upon application to

Treatment of Grindstones

Quality of Newsprint and Book Paper Influenced by Character of Mechanical Pulp Which in Turn Depends on Burring of Stone

By WILLIAM A. MUNRO
Washington Pulp and Paper Corporation, Port Angeles, Wash.

A FEW years ago the manufacture of groundwood pulp was considered a most simple and unskilled process. The groundwood mill was a cold, wet place where wood was ground, a place to be forgotten when the paper machines were running well, but an ever present place to "pass the buck" when trouble developed and production did not come up to expectations.

The increasing cost and scarcity of wood together with the desire for safe and satisfactory operation of the paper machines at higher speed caused more attention to be paid to the groundwood mill and greater thought and care to be given to operation and the selection of personnel.

It is now conceded that the quality and the running ability of the paper, at least those papers with a considerable proportion of mechanical pulp, depend almost altogether on the quality of stock produced by the groundwood mill.

Factors in Production of Good Newsprint

The paper machines, no matter how well clothed or skillfully operated, can not make a good sheet of paper out of inferior groundwood. With this in mind, the progressive mills are making a study of the factors that have a direct bearing on the quality of the stock and are endeavoring to so arrange and standardize them that a uniform stock of a good quality will be delivered to the paper machines twenty-four hours of the day.

The several factors that affect quality and production, some to a greater degree than others but all contributing to the final result, are peripheral speed, pressure of the wood against the stone, temperature of the grinder pit and the cutting surface of the stone. The last named consideration is far more important than the others and more difficult to keep constant. This condition arises from the difference in grit of the several pulpstones in use and also to the fact that it is difficult for different stone men to dress each stone in the same way.

Advances in Stone Dressing

When groundwood was first manufactured the stones were then dressed by means of a hand pick shaped not unlike a small adz and many peculiar and fantastic designs were cut into the face of the stone. Each pulpmaker had his own design and it is told of a man in charge of a mill that he kept his design a secret and never allowed any one else to see him at this work or help him in the least.

At present a small round metal cylinder with a hard patterned surface, commonly known as a burr is revolved against the stone and the pattern on the face of the burr thus transmitted to the stone.

This stone dressing is more often called stone sharpening but sharpening is a misnomer and should not be used because of its inaccuracy. Correct burring or jigging a stone consists of giving it a dress with a burr that opens up or prepares the grit of the stone in such a way that the desired grade of stock is produced. Sometimes the pulpstone's rate of production or degree of sharpness is reduced, while in others it is increased, all depending on the nature of the pulpstone or the quality of the stone's binding particles. If the binding particles break down first, exposing more and rougher cutting particles, the stone becomes rough, the stock coarser and more uneven and generally full of fiber bundles or shives instead of true fiber. If, on the other hand, the cutting particles break down first the result is a smoother, duller stone with a decreased production and slower, finer stock.

The most satisfactory and uniform grades of stock are produced by the cutting action of a pattern made on the stone by a burr rather than that produced by the cutting action of a stone's grit.

Types of Burrs for Dressing Stones

There are in general use three types of burrs, the solid burr, the shell or tube burr and the sectional or disk burr. The solid burr is the oldest type and consists of a solid steel cylinder about 3½ inches in diameter and 3 inches in width. The pattern or design is fashioned on the periphery or face by means of a lathe and after cutting the surface is hardened to prolong its life and to give greater wearing qualities. The center is drilled out to whatever size is desired so that the bolt of the lathe holder can be run through the burr.

The solid burr, provided there is no play between it and the lathe holder bolt, makes a good clear impression on the stone, there is no give or chattering as the burr is run across the stone and the results are generally satisfactory. The high initial cost together with the machine shop charge for recutting and hardening has resulted in the more general use of the shell burr type that is discarded when the teeth are worn to an undesirable extent.

The standard shell burr is made out of seamless steel tubing cut into suitable lengths for burrs. The blanks are then put into a special machine called a bobbing machine and the desired pattern cut on them. After the burr is fashioned it is case hardened to the point that gives the best results.

The bevel type shell burr is a recent invention and improves the results formerly obtained by the square shouldered or older type. This bevel acts on the same principle as a set of pipe cutting dies and allows the teeth of the burr to work themselves gradually into the stone. This eliminates the chipping or digging action of the leading corner of the square-shouldered type and results in a cleaner and more uniform impression on the face of the pulpstone.

The sectional burr is a hardened cast iron disk with teeth on its periphery. The type of this burr depends on the number of teeth to the inch, generally running from four to six. The sectional burr is not widely used in burring stones but is generally employed in turning up stones after they are hung and in turning down and smoothing off stones that have shelled out or developed a bad hole.

Types of Mandrels or Burr Holders

Several types of mandrels or burr holders have been developed to use with shell burrs. The first type consists of a plain round cast iron casting with a center large enough to hold a roller bearing. The fork bolt or holder bolt fits through the roller bearing.

The outside diameter of the mandrel is a few thousandths of an inch less than the inside diameter of the burr and the burr is held from turning by an offset pin that fits through from the center of the mandrel and into a hole in the burr. The hole in the mandrel is of a larger diameter than that in the burr. The pin is made smaller in diameter at the burr end and the shoulder thus made prevents the pin from working out through the burr while the roller bearing prevents it from dropping back and disengaging the burr.

The more recent types of mandrels have done away with the pin and depend on expansion to prevent the burr from turning. This type consists of two bevelled parts which expand when forced together and grip the burr so tightly that it is impossible for it to turn.

The burr held securely in its mandrel is placed in the dressing stick or lathe holder when it is to be used on a stone. Some mills still use what is known as a dressing stick or pole. This stick is supported and guided on a pipe or round bar extending from one side of the grinder pit to the other and the stick with the burr attached pushed across the face of the stone, the pipe or bar acting as a fulcrum for the sharpening pole. The success of this method depends too much on the skill of the operator and tends to cause uneven wear on the stones, especially on the starting side.

Dressing Sticks Replaced by Lathes

The screw lathe and the hydraulic lathe are in more general use, give far better results and keep the stones truer and in better shape. In the screw lathe type, the burr carriage is moved across from one side to the other by means of the cross-feed screw and in the hydraulic type the carriage travel is accomplished by means of a hydraulic cylinder and piston.

Tooth Arrangement of Burrs

Burrs are made at the present time in four basic patterns or types of tooth arrangement. They are the thread, the spiral, the straight cut or straight fluted and the diamond. There are probably several hundred different variations and kinds but all can be grouped under one or the other of the four main patterns.

The thread burr pattern is very well described by its name and resembles the thread on a pipe or bolt. The number of threads to the inch determine the grade of these burrs.

The spiral burr has its teeth cut at an angle to its axis. The number of teeth to the inch is called the pitch or cut and the angle of the slope is called the lead.

The spiral is graded by both the pitch and the lead, as 8 cut, 1¼ inches lead. This means a burr with eight teeth to the inch and a tooth lead or advance, from where one tooth starts on one side of the burr to where it ends on the other, of one and a quarter inches.

The straight cut burr has the teeth in a straight line across the face of the burr parallel to the axis of the burr. They are graded according to the number of teeth to the inch on the burr's periphery.

Diamond Burr

The diamond burr pattern is a combination of the thread and the straight cut patterns and is identified by the number of apexes or diamond points to the inch of the periphery, as they do not always have the same number per inch measured across the face.

There is no established rule for the selection of burrs to make a desired grade of stock since too much depends on the other conditions in the mill and the human element. The same quality of stock is very often obtained by entirely different burrs and pressures or a different combination of both. It has been practically demonstrated and is generally accepted in groundwood circles that the finer the cut of the burr the finer the pulp, all other conditions being constant. Also, that a coarser burr with a lower pressure will give a pulp of the same general nature and freeness as a finer burr with a higher pressure. In a discussion of the comparative results produced by the different types it will be necessary to consider all other elements as speed; pressure and temperature as constant and to have the stone's surface as the only variable, as a change in the others would make comparison of the stock from the different burr types inaccurate and useless.

Effect of Burrs on Pulp

The stock or groundwood pulp produced by a thread burr is short, and fine fibered, with a minimum of sliver waste; on the other hand, especially with the finer cuts as the No. 10 and 12 thread, the white water consistency becomes unduly high and in a mill without a closed system the loss in fine fiber or flour is considerable. This burr is difficult for the inexperienced stone man to use successfully as it has a tendency to jump its groove or double pattern in its travel across the stone, producing a very uneven stock and a large amount of waste. The best results are obtained by using this type of burr lightly and as often as the grit of the stone and freeness desired requires. The fine thread burr is used largely in book stock and sometimes in news.

The straight fluted burr produces a maximum of long fibered stock together with a large amount of slivers. This type gives a greater production per stone and a lower power consumption per cord of wood than any other type, the number of teeth to the inch being the same. The straight cut burr pattern on the stone being parallel to the wood fiber has a tearing action on it so that while pulling out and causing a longer fiber it also produces a larger number of shives or fiber bundles which are of no use in the better grades of groundwood. This condition is improved and modified as the pitch increases but the production per stone drops off at the same time. The coarse straight cut is used to make wall board stock and some mills use a 10 to 12 straight cut for news stock.

When quality and not production is the paramount consideration the spiral burr is widely used. In the case of burrs of the same pitch or cut the amount of sliver waste is less as the lead increases; the fiber becomes shorter and the production less.

The Two Kinds of Spiral Burrs

There are two distinct types of spirals, the right and left hand, distinguished from each other by the direction of the angle or slant of the tooth. In one case the leading part of the tooth or toe of the burr that should always go first across the stone, is on the left side and in the other on the right. These burrs producing the same grade of stock are used alternately in sharpening, the advantage of using both being that the stone is kept evener and that new grit is continually being opened up. The spiral pattern on the stone has an easier effect on the wood than the straight cut and results in fewer slivers and less waste. The best results in strength of fiber are obtained by using a fairly low lead. A high lead spiral tends to give a thread burr stock fairly fine, short and weak, lacking the felting qualities of a stock ground with a shorter lead burr. The ideal spiral burr would be the one that would give, combined with other mill conditions, the greatest production and strength of fiber with the least waste.

The spiral type of burr is used considerably in newsprint mills and the most popular type is the eight cut with leads running from one to three inches; however, on very high speed machines there is a leaning to finer cuts and the results obtained in many instances have justified the action.

The diamond burrs can be used to produce all grades of stock from free wall board as made by a No. 4 or 6 cut diamond to the fine slow stock used in book paper made by the much finer diamonds as the 12 to 14.

A coarse diamond burr is often useful in opening

An Improved Save-All

The accompanying figures show a save-all which is patented in French patent No. 559,749 and which is used in recovering pulp from the white water in factories which make paper, cardboard or wood pulp.

The process consists essentially in making the waste waters pass through a decanting device, in other words an apparatus for removing solid, suspended matter from water, in such a manner that the rapidity of flow of the water through the apparatus decreases constantly from the moment it enters. This progressive diminution in the speed of the circulation permits the solid matter to settle to the bottom of the apparatus with the minimum risk that it will flow out with the water through the overflow.

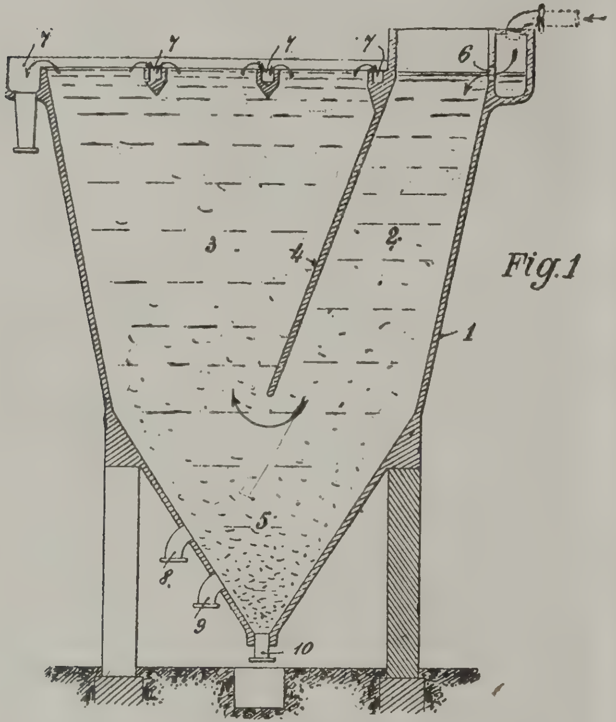

Fig.1

Figure 1 shows a vertical section of the apparatus while figure 2 is a plan view.

The apparatus consists of a tank 1 the upper part of which is divided into two unequal parts 2 and 3 by a partition 4. The lower part 5 serves as the depositing device. The waste waters that are to be treated, enter the apparatus at 6, which is in part 2 and leave the apparatus again at the upper section of part 3 by the overflow 7, after having passed around the partition 4. The latter is arranged in the tank in such a manner that the areas of the transverse sections that are passed through by the waters from their entrance at 6 to their departure at 7, increase continuously. This causes a continuous diminution in the speed of circulation as the waters travel through the save-all.

The materials that are held in suspension, being heavier than water, collect in the lower part of the apparatus 5, from which they are withdrawn in a continuous stream through the outlets 8 and 9, and carried over into the beaters, then to the proper machine where they are mixed with new pulp. A blow-off outlet is seen at 10 for cleaning out the save-all.

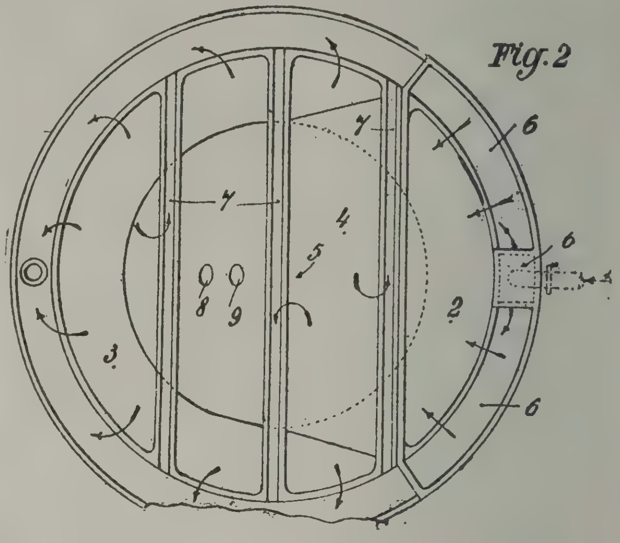

Fig.2

The apparatus is constructed from any suitable material, such as sheet metal, reinforced concrete, etc.

There is no channel or any other part within the internal structure of the apparatus which is capable of retaining the deposited matter. The walls are made all in one piece and all points within the apparatus are easily accessible to a stream of water for cleansing purposes.

The advantages of an apparatus which can be easily and quickly cleaned are readily appreciate in those plants where it is necessary to recover waste waters from paper making machines where different kinds of paper are made. Such waters contain different kinds of pulp in suspension and it would not do to have these pulps mixed with one another. This also holds good for those plants in which frequent changes are made in the manufacturing process.

The dimensions of the apparatus are dependant on the quantity of water that is to be treated.

World's Largest Micrometer

A micrometer measuring 60 inches, and said to be the largest in the world, has just been completed by the Bagley & Sewall company, of Watertown, N. Y. It was tried out at the plant last week, and worked to perfection, officials of the company said. It will be used to measure rolls on paper machines, and will not be manufactured commercially, being employed only by the Bagley & Sewall company.

The giant micrometer works on precisely the same principle as a micrometer six inches in span, except that owing to its size it has to be mounted on a center pin. Its accuracy is marvelous, it was said at the factory today. It will measure down to one-thousandths of an inch easily, and for even finer work could be adjusted to record fractions of that space.

At Pittsburgh, Pa., there is a micrometer measuring 40 inches, and at Manchester, England, in a machine shop there is one measuring 48 inches. Engineering journals and records, however, fail to reveal that one so large as that now in use by the Bagley & Sewall company has ever been turned out in the world.

Rapid Analysis of Paper

French Technologist Explains Method for Quickly Determining Constituents of a Paper Sample for Purposes of Duplication

By Jacques Crolard

(Continued from last week)

IN the previous article on this subject it was shown how the character of the paper can be determined by certain chemical tests. Particular attention was paid to the determination of the proportion of wood pulp that may be mixed with the paper. The mechanical wood pulp content of the paper is given special consideration owing to the fact that different makes of this pulp differ radically in appearance, chemical composition and mode of treatment. This ingredient should really be considered as a paper filler, possessing certain very marked characteristics. But it must be remembered that mechanical wood pulp is an organic mixture of rather complex character containing cellulose, lignin, oxycellulose, pentosans, etc. All these ingredients are affected differently by atmospheric agents. The cellulosic filler is far from being a neutral substance. It changes, oxidizes, alters its color, etc., as the paper ages. Papers that contain mechanical wood pulp lose their strength comparatively early and attain a disagreeable yellowish tone.

Analysis of Fibers

There are two methods for analyzing the paper both quantitatively and qualitatively to determine the proportions of various fibers in it. One of these methods makes use of the microscope and the other is dependent on the microscope only for the qualitative determination, the quantitative estimation being carried out by chemical means.

The microscopic method of analysis, which is well-known to paper chemists, is based on color reactions which are characteristic of a certain fiber and which take place in the presence of solutions of certain mineral salts or organic coloring matters.

From the qualitative standpoint this method possesses certain difficulties. Something more than a knowledge of the chemical characteristics of the fibers, their physical aspect and their average dimensions is required in order to successfully carry out a microscopic qualitative examination of the paper sample. It is, moreover, necessary to take into consideration the chemical transformations that have taken place in the structure of the fibers as a result of various treatments that the cellulose is subjected to during the processes of digestion, bleaching and beating. A partial hydrolysis of the cellulose fiber may bring about quite an appreciable change in the color that is obtained when the former is treated with various color reagents.

It is, therefore, advisable to separate visibly all the different fibers of the paper into various groups according to their origin. This operation is fairly simple, as very clear differences exist, for example, between chemical pulps and rag pulp, etc. But after the grouping of the fibers has been carried out in this fashion it requires a considerable degree of skill to distinguish between the various fibers that are included in the chemical pulps or, more exactly, the wood fibers, both chemical and mechanical. This is particularly the case when the pulp has been beaten for a comparatively long time and partially hydrolyzed.

The operation is especially difficult when it becomes necessary to estimate quantitatively the proportions of the various kinds of wood fibers in the paper.

Use of Coloring Reagent

A good method consists in first evaluating the importance of each group of fibers in the paper, and in doing so it is necessary not only to take into consideration their number, but their volume and density as well. It is also convenient to determine the relative proportions of the various kinds of fibers.

In making a colorimetric examination of a paper the chemist seeks to use that coloring reagent which will give the fibers maximum visibility under the microscope. It is a known fact that the fibers color with entirely different intensities according to their inherent nature. Certain colors, furthermore, produce a stronger physiological impression on the eye than others. There is no doubt, for example, that in a mixture consisting of equal parts of a very vivid yellow and a garnet, the eye which is not particularly skilled in picking out colors will see more yellow than garnet. There are, morever, certain color reagents which color only a certain kind of fiber, the remainder remaining grayish in tone. In such case an error in the estimation of the fiber present in the mixture is almost inevitable.

A simple means of avoiding the errors referred to is to examine the paper after treating it with different color reagents, giving more than one coloration. The determination of the percentage of different fibers in a mixed paper is an operation which requires considerable skill. It is really a very delicate operation, laborious and tiring to the eye. It requires considerable patience and great care on the part of the paper chemist as the method is based solely on observation.

In what follows there will be described conditions under which it is possible to avoid using the microscopical method and employ a more exact chemical method, giving more constant results.

Finding Proportions by Chemical Tests

Under the generic expression "cellulose" is classified all the chemical substances which constitute paper fibers. These can be divided into the following classes in accordance with their definite chemical characteristics.

1. Normal celluloses; cotton, linen, hemp, ramie.
2. Celluloses isolated from the oxycelluloses of cereal plants: straw, esparto.
3. Celluloses isolated from the ligno-celluloses, the ligno-cellulose of jute, the ligno-cellulose of wood.

It is impossible to give here a detailed description of the chemistry and chemical properties of these celluloses. Time and space are available only for the discussion of the various processes or treatments to which these celluloses may be subjected to differentiate one class from the other, so that quantitative results on the proportion of each present in a mixture may be ascertained with a satisfactory degree of accuracy.

The first matter to be considered is the determination of the furfuraldehyde index of lignin, of a pulp or of a paper.

Natural oxycelluloses are the principal ingredients of the straw, esparto and bamboo fibers. These organic substances possess the important property of yielding considerable quantities of furfurol when they are subjected to hydrolysis with acid under certain conditions. The cellulose products that are isolated from ligno celluloses are likewise oxycelluloses, but the quantities of furfurol obtained are much less and vary with the nature of the wood.

The furfuraldehyde index expresses the percentage of furfurol that is obtained from a pulp or paper by hydrolysis with acids.

From numerous experiments and practical observations it has been determined that there are a number of constituents which produce furfurol, such as the pentosans and the beta celluloses, that may disappear during the course of the treatment that paper pulp is subjected to during its manufacture into paper. It is, therefore, necessary for the paper chemist to know the furfuraldehyde indices of various kinds of crude and bleached paper pulps with the utmost degree of accuracy.

Furfuraldehyde Indices

Rag cellulose	0.5 percent
Crude jute	8.0 percent
Bleached jute	5.0 percent
Bleached sulphite pulp	4.0 percent
Crude straw pulp	16.0 percent
Bleached straw pulp	13.0 percent

Operating Method

Very important experiments have been made by the paper chemist, Tollens, on the principal condensation products of carbohydrates which can produce furfurol. Furthermore, detailed researches have been carried out by Cross and Bevan and numerous other paper chemists on the hydrolysis of lignocelluloses. It has been determined from these experiments that the formation of furfurol, the aldehyde of the furfurane group, is quantitative; this reaction may therefore be used to determine the exact percentage of oxycellulose in a paper.

Ten grams of the paper or pulp that is being examined are placed in a flask or beaker and covered with an acid mixture containing 56 percent of sulphuric acid and six percent of hydrochloric acid and 38 percent of water. A very thick paste is formed which is vigorously agitated. It is then diluted with two hundred cubic centimeters of a solution of hydrochloric acid of 1.06 density, corresponding to 8 degrees Be.

The mixture is then transferred to a flask which is provided with a two-holed stopper. Through one hole the glass tube of a separatory funnel is introduced and through the other a glass tube with a suitable bend to connect it with a condenser.

The mixture is then distilled, the flask being heated in an oil bath. The rapidity of the distillation should be such that about two cubic centimeters of liquid are obtained per minute. The liquid in the distilling flask is maintained at a constant level by the addition of hydrochloric acid of 8 degrees Be through the separatory funnel from time to time.

The distillation is stopped when a drop of the distilled liquor no longer gives a rose colored reaction with a crystal of aniline acetate. In making this test it is well to wait a little for the reaction to take place, as the aniline acetate indicator does not react quickly.

Methods for Determining Furfurol

The methods of determining the furfurol in the liquor distilled over from the flask are numerous. Among these may be cited precipitation by ammonia, the volumetric determination of the furfurol with the aid of standard solution of phenylhydrazine, the transformation of the furfurol into hydrazone, the precipitation of the furfurol by means of a silver salt, its titration with a solution of phloroglucine chlorhydrate, colorimetric methods of determining the furfurol, and so on.

From the scientific viewpoint the colorimetric methods must be disregarded, for they do not give results with a sufficient degree of accuracy, and in the present case they do not possess any particular advantage as far as rapidity of determination is concerned. On the other hand, of all the methods which have been enumerated above, there are two which always give good results. These are the transformation of furfurol into hydrazone and its titration by means of a standard solution of phloroglucin.

The next step in the analysis, then, is to convert the furfurol into phenylhydrazone. To do this the distilled liquor which contains the furfurol and hydrochloric acid is neutralized with carbonate of soda. A slight excess of this is added and the solution is acidified again with acetic acid. In order to obtain constant results it is necessary to make sure that the concentration of sodium chloride are sensibly the same in each operation.

The general reaction of the formation of hydrazones by the coupling of a hydrazine on an aldehyde makes it posible to obtain phenylhydrazone by the reaction of furfurol with phenylhydrazine. In this case the phenylhydrazone is insoluble and easily separates out from the solution. The phenylhydrazine solution that is used for this purpose is obtained by dissolving 12 grams of that substance in 7.5 grams of acetic acid and then making up the solution to a volume of one hundred cubic centimeters.

To this solution the liquor containing the furfurol is added and the whole mass is vigorously agitated in order to facilitate rapid precipitation of the hydrazone. The reaction is complete when a drop of the mixed liquid no longer gives a rose colored reaction with acetate of aniline. The hydrazone is then separated by being filtered on a tarred filter paper, washed and dried in a vacuum oven at a temperature of approximately 60 degrees C.

The weight of the furfurol originally present in the distilled liquor is obtained from the weight of the hydrazone by means of the following equation:

Weight of furfurol—Weight of hydrazone x0.538.

The theoretical factor which must be multiplied into the hydrazone to give weight of furfurol is 0.516 according to numerous tests which have been made to fix it exactly, but other experiments have shown that this figure is too low owing to the slight solubility of the hydrazone, and accordingly the factor 0.538 is adopted as giving results which are closer to the actual truth.

Example of Calculation

An example of the way in which the analysis is carried out will serve to explain perhaps more clearly the method which has just been described. Suppose it is desired to analyze a paper which contains a mixture of rag and straw fibers. The weight of hydrazone is found to be 12 percent in accordance with the described method. From this it is found that the furfurol formed by the hydrolysis of the paper or the furfuraldehyde index of the paper is 12x0.538 or 6.45.

In the preceding table it is seen that the furfuraldehyde indices of rag pulp and bleached stray pulp are 0.5 and 13 percent respectively. Hence the proportions of rag stock and straw stock in the paper are found from the following calculations:

(Continued on page 19)

Plans for 1924 Paper Exposition

THE Paper Industries Exposition has reserved the entire first floor of the Grand Central Palace for its 1924 exhibition, and has made tentative reservation of the mezzanine floor in addition, if the number of exhibitors warrants this expansion of the paper show which will be held the week beginning April 7th.

The success of the first exposition held in April, 1923, was such that the change to first floor space with its greater facilities for showing and viewing exhibits was justified. Already there have been contracts for space received from the 123 of those who exhibited in the 1923 exhibition, so the exposition can now be considered as an annual event in the paper industry.

The attendance at the 1923 exposition was surprisingly large, there being 63,155 in attendance, and this in spite of the fact that it was the first paper show of national extent ever to be held in the United States. The endorsement of the exposition by the paper industry was largely responsible for this success, and the conduct of the show is such that the association in the indutry which endorsed the exposition in 1924 have already announced their endorsement of the Paper Industries Exposition as a recognized annual affair.

The attendance at the 1923 exposition was surprisingly distributed between technical men, superintendents, plant executives, jobbers, printers and the general public interested in the story of paper. The second show, with more exhibits and an even greater variety will undoubtedly attract even greater attention than the first "Paper Show" as it came to be generally known.

As was the case with the first show, the exposition will be held during the week when the American Paper and Pulp and National Paper Trade Associations and their affiliated organizations are holding their annual meetings at the Waldorf Astoria.

These conventions bring together paper manufacturers and merchants from all parts of the country, and as was the case last year, some special sessions of paper organizations will be held at the exposition. Both of these organizations have officially endorsed the Paper Industries exposition, and are represented on the advisory committee selected to consult with the exposition management. Other such organizations as the Salesmen's Association of the Paper Industry, the Technical Association, are included on the committee, as well as representatives of colleges whose work leads students to enter the paper industry. As was the case last spring, there will be special attention paid to the forestry problem as the basis of the raw material of the industry, and the exhibits already arranged for next spring include displays ranging all the way from chemicals to the machinery supply house, the mills themselves, and the jobbers who market the products of the paper machines.

A department to which special attention will be given is that of the converted products of paper, such as sanitary packages for food, special use papers, boxes and bags and the like.

In the arrangement of the week's program every effort will be made to hold special feature program of the exposition at times which will not conflict with the convention program of the paper manufacturers and merchants. Plans for a special technical program are already under way, and as last spring, the 1924 program will be replete with special features for each day of the exposition week.

Changes in Marinette and Menominee Mills

During the past year many improvements have been made at the two plants of the Marinette & Menominee Paper company.

At the Marinette mill, a concrete loading platform has just been completed which is nearly 300 feet in length, making it possible to spot nine cars for loading paper.

A new water system has been installed on all four machines so that they are now using white water for the showers, etc. Four large save-alls have also been put in, making practically a closed system for the mill.

A new sizing system was recently adopted and they are now making their own size.

A new Marshall drive has been installed on the number four machine to replace the old one and six more dryers have been added to this machine.

The installation of governors for the water wheel has just been completed and a new boiler put in at the power plant. In addition a Worthington boiler feed pump has been added and a hydro-electric steam turbine installed for auxilliary use.

A 700 foot well has just been sunk which will supply drinking water as well as water for the acid plant.

Three rope drives have been put in which has made obsolete about 500 feet of shafting and concrete has replaced practically all the old wooden floor throughout the entire mill.

At the Menominee plant, the old sulphite wet room has been torn down and the wet machines moved into the groundwood wet machine room. A new decker has been added for both sulphite and groundwood, also a knotter and two centrifugal screen. A concrete hot pond has been built which will be heated by waste steam and liquor from the digesters.

In the machine room a new rewinder has taken the place of the old one, and a big save-all installed in the basement.

Visitors at Association Headquarters

Among the callers at the American Paper and Pulp Association offices were the following:

Hon. Axel Wallenberg, Swedish Minister to the United States.

G. P. Genberg, a Swedish student who has been sent to the U. S. to study paper under the auspices of the American Scandinavian Foundation, which exchanges its scholarships with American students who study in Sweden.

D. A. Smith, District of Columbia Paper Manufacturing Company, Washington, D. C., visited Dr. Baker to discuss government specifications for paper, as he represented the association at a recent hearing at Washington on this subject.

Henry W. Stokes, President of the association, was in for a visit to discuss association affairs.

J. L. Coker, Carolina Fibre Company, Hartsville, S. C., and D. A. Crocker, Eastern Manufacturing Company, Bangor, Me., were among other visitors of the past.

Stream Pollution

Recognition of the position of the paper manufacturers that there should be a thorough investigation of the principal phases of the water pollution problem before an attempt is made to legislate on this matter has been given by the National Coast Anti-Pollution League in a suggested program which recommends a detailed survey as to present physical conditions, research as to methods of eliminating pollution with reasonable conferences of particular industries involved. Sedley Hopkins Phinney, representing the league, has discussed this matter with Dr. Hugh P. Baker, executive secretary of the American Paper and Pulp association, and has shown that the program of the Anti-Pollution League is not such as to mean improper legislation without a definite knowledge of all the conditions involved.

At the 1921 Congressional hearings, Secretary Hoover urged that there be an investigation of an exhaustive character and declared that any general prohibition of pollution as against all forms of pollution was undesirable at the present moment without more information. He added, "We might be doing in some localities infinitely more damage to industry and to commerce than the value of any fishery that could be established would warrant."

Dr. Baker, in appearing at some of the hearings, said that the paper industry was greatly interested in this subject because of its own need for large quantities of good, clean water, but that before any legislation is enacted, there should be a more definite knowledge than there now exists as to the actual effects of what the ignorant casual observer might suppose to be pollution.

Valley Electric Builds New Dam

The Wisconsin Valley Electric company has started the erection of a new dam and power house at Rocky Carry on the Wisconsin river, three miles northwest of Merrill, and expectations are to develop 5,600 horsepower to be added to their present capacity of 11,000 horsepower generated in its power plant at Tomahawk, Merrill, Wausau and Stevens Point. The power from the new plant will be joined to the system and distributed among the four cities, according to H. L. Geisse, secretary and general manager of the company.

About thirty men are employed clearing away the brush and timber so that the dam proper may be started within a short time. The camp is also being built. As the work continues the number of employees will be increased to at least one hundred.

The dam will be constructed of concrete, being known as a complete gate section across the river and consisting of nine gates, each twenty-six feet in length.

The plans for the power house are not completed. However, the equipment will include three wheels and generators, capable of developing 5,600 horsepower.

Mr. Geisse says that the dam and plant will be completed and ready for operation within one year. Henry Lorge of Wausau is the construction foreman.

The backwater from the dam will create a large lake which it is believed will beautify the shores of the river and will be close to the Grandfather Falls road, increasing the beauty of that splendid drive.

Paper Company Adds Bag Unit

Operations were commenced recently by the Angelus Paper company, of Los Angeles, in its new plant on East Twenty-fourth street. The concern is the first to undertake the manufacture of paper bags in this section of the West, according to its officials.

The products of the company consist of all types of paper and paper bags. The bags are made on five machines which comprise the first battery to be placed in operation. These machines have a capacity of one hundred and eighty bags per minute. All paper used by the concern is made in Los Angeles.

The product of the organization will be sold directly to the Nelson-Parr Company, a Los Angeles firm, which has been distributing between three and four carloads of eastern-made bags each week.

The officials of the company are: Frank P. Taylor, president; J. Nixson Gregory, vice-president; Charles W. Churchill, secretary and treasurer. William Parr and Brinton Gregory are other members of the firm's board of directors.

Electric Drying Cheaper Than Coal

By **B. T. McBain,** ***Assistant General Manager, Nepco***

SOME years ago I had something to do with some experiments with the drying of paper with electricity as the heating agent; but those tests were made with electrical elements on the inside of a cast iron dryer and were not a success even with electrical power costing very much less than steam, in fact only 1-10 as much. The chief reason for the failure, in my opinion, was the use of the cast iron drying cylinder, or, in other words, doing what others have always done and thinking that the only and correct way.

At that time my idea, like most all paper mill men, was that in order not to produce a cockelled sheet it was necessary to have the paper alternate from one side to the other over various drying surfaces and I turned down the idea submitted at that time to try a cylinder like a wet machine cylinder mould with electrical elements on the inside and alternate the paper from one to the other.

Now, we are all liable to learn if we keep on studying and investigating and many times the ideas of men outside the industry prove of even greater value than those of men working in a certain groove, as it were.

For the past two or three years a young chemical engineer has been working on an entirely new procedure and has secured patents on his method of drying paper with electricity. He built a small experimental machine, making a sheet of cylinder formed paper 20 inches wide and 90 feet per minute. His tests proved beyond a possibility of a doubt that he can dry paper cheaper with electricity than with steam and without cockelling. Besides, his paper is from 15 to 25% stronger than by the old stretch drying process by steam and in many other particulars the sheet is superior to the old method.

A practical demonstration will soon be made. A 90 inch Fourdrinier machine is now being built with drying capacity up to 500 feet per minute and within the next three or four months the idea will have been thoroughly demonstrated to the world that there are other ways of doing even these things than the old trodden paths of our forefathers in the pulp and paper industry. Then, to dry paper with steam will be as great a waste, if not greater, than the old waste of running all the white water into the sewer, which is still being done in so many mills.

Here's a vote of thanks to John E. Alexander the inventor, for his thoughtfulness and effort, also an assurance in writing that I thoroughly believe his practical test will prove not only the success that I know it will be but the means of putting those mills with electrical power on the top of the heap.

New Kraft Mill in Portland

A papermaking plant, representing an investment of $1,250,000 will be erected in Portland near the Monarch mill after the first of next year. An option on the site has been secured from the Peninsula Investment company. The size of the new factory will be approximately 80 feet by 300, and will be equipped with two paper machines. The estimated cost of the machines and installing them is given as $250,000 for each machine.

The corporation plans on making kraft paper only, made from mill refuse obtained from nearby plants. The paper mill will thus utilize a grade of waste timber that previously was not used. When completed the mill will have an output of 50 tons daily.

At a meeting of the promoters the following board of directors was named: F. D. Thielson and Hugh G. Boyer, Salem, Ore., D. J. Fry, R. H. Mills, E. M. Fouch, N. J. Sykes, and R. R. Clark, of Portland.

Mr. Mills has gone east to order machinery for the factory.

Huge Paper Plant Completed

Built at a cost of more than $1,250,000, the new paper mill, felt mill, asphalt refineries and roofing factory of the Pioneer Paper company, occupying sixteen acres in Vernon, California, a suburb of Los Angeles, began operation recently. The capacity of the new plant will be one million eight hundred thousand square feet of roofing paper per twenty-four-hour day. A feature of the factory is special machinery which will manufacture waterproof chip board and case lining under a new process.

In addition to the felt mill and roofing plant, large warehouses have been constructed for storing rags, paper and pulp, as well as the finished products of the factory. Spur tracks with direct connection with the three continental railroads running out of Los Angeles have been run into the property.

The Pioneer Paper company was founded in 1888 by Will G. Hunt, who is still president of the concern. At the inception of the company manufacture was conducted on a small scale. Henry Eichelberger is secretary and treasurer of the organization and William Henry, vice-president and general manager.

Products of the plant are shipped to all points in the West, Alaska, Mexico, South America, and the Orient. In addition to roll roofings of various types, slate-surfaced shingles, insulating and waterproofing papers, as well as fruit and butter wrappers, are manufactured by the company.

The felt mill is declared to be the only one in the southwest. The machinery was built in the East. It has sixty dryers and four cylinders, operated by electric motors, and turns out roofing felt, sheating paper and lightweight chip. All the buildings are of brick.

Engineers Open Atlanta Office

Dwight P. Robinson & Company, Inc., of New York, have opened an Atlanta office in the Healey building, with W. Rawson Collier in charge. Mr. Collier was for many years with the Georgia Railway & Power company. He joined the Dwight P. Robinson forces several months ago, coming to them from the Poughkeepsie Gas & Electric Co.

The opening of the Atlanta office gives the company a total of eight branches. Other branches are at Chicago, Pittsburgh, Youngstown, Philadelphia, Montreal, Los Angeles and Rio de Janeiro.

Among the company's recent activities in the south are the new wet-process cement plant of the Lehigh Portland Cement company at Birmingham, Alabama; extensions to the steel plant of the American Rolling Mill company at Ashland, Kentucky; extensions to the power generation and distribution systems of the New Orleans Public Service Inc., New Orleans, and the design and construction of the fifth sulphur mining plant which they have built for the Freeport Sulphur company at Hoskins Mound, Texas. The company is also arranging to build a 300 room club-hotel at Palm Beach, Florida.

Kraft Pulp vs. Bi-Products

The Kraft Bi-Products association of Minnesota, Wisconsin and Michigan kraft pulp manufacturers met in Chicago at the Union League club on Friday, Nov. 30th, 10:30 A. M.

Those present were:

Wausau Sulphite Fibre Co. represented by C. Bache-Wiig.
Nekoosa-Edwards Pa. Co. represented by L. M. Alexander and B. T. McBain.
Marinette & Menominee Pa. Co. represented by J. H. Delbridge.
Minn. & Ontario Power Co. represented by B. G. W. Forrester.
Stevens Point Pulp & Pa. Co. represented by E. G. Goodell.
Ontonagon Fibre Co. represented by Gus Enderlein.
Prof. A. H. White of Ann Arbor, Michigan.

The meeting was called to order by B. T. McBain, chairman.

The purpose of the meeting was for discussion of Dr. White's reports and recommendations and arrangements were completed for a committee composed of O. Bache-Wiig and B. T. McBain with Dr. A. H. White as third and consulting member, to immediately plan and erect a lime sludge recalcining plant and to employ a competent engineer for the purpose. The names of two experienced lime plant engineers were suggested and, no doubt, one of these will be selected. This is only one of the waste saving schemes to be gradually worked out.

It is said that the bi-products in some industries are of more value than the original product. The Kraft Bi-products association hope to prove this in the case of the kraft pulp industry.

First Issue of Commerce Yearbook

Aiming towards the ultimate stabilization of business and industry through the reduction of economic losses resulting from the recurrent extreme of the business cycle, the Department of Commerce announces something entirely new in the way of government service to business in the form of the first issue of the Commerce Yearbook.

As outlined in the director's letter of submittal to Secretary Hoover, the Commerce Yearbook has been prepared by the Bureau of Foreign and Domestic Commerce, with the cooperation of the Bureau of the Census in response to the demands of American business men, bankers, economists, trade association executives and the trade press for an authoritative review of the economic year throughout the world prepared from the point of American industry and commerce. This first issue covers not only the year 1922 but also the early part of 1923.

Commerce Yearbook is published to meet the need not merely for a reference source to be consulted only for the specific facts on the recent past of business but for a book that can be read for general commercial information and for a survey of the most important economic developments of the year.

Summarizing a review of the pulp and paper industry, the Yearbook says:

"After the decline in 1921 the pulp and paper industry made a general recovery in 1922. Production of pulp and paper rose to 23 per cent and 31 per cent, respectively, above the production for 1921 (which, it may be noted, was about the same as in 1914) and was only 9 per cent and 4 per cent, in each case, below the output for the peak year, 1920. Preliminary figures for 1923 indicate that production for the first quarter exceeded the high average which prevailed in 1922.

"Prices continued the 1921 decline during the first half of 1922, but rose during the remainder of the year and the first quarter of 1923. Imports and exports decreased 3 per cent and 7 per cent, respectively, in comparison with 1921."

Statistics are given showing the total production of pulp and paper in the United States from 1914 to 1922, inclusive, and there is a brief but comprehensive review of price movement and market conditions from January, 1913, to April, 1923.

A section is also devoted to foreign trade, including tables showing imports and exports of pulp and paper manufactures and printed matter.

Copies of the Yearbook may be obtained for 60 cents each from the Superintendent of Documents, Government Printing Office, Washington, D. C.

Utilization of Waste Paper

How the junk dealer's truck is a means of forest conservation is told by a writer in the November number of American Forestry, when it is pointed out that the waste collection industry claim a rank in the billion dollar class. "One thing is certain," says this article, "the paper manufacturers of the United States pay the waste paper men the surprising figure of $50,000,000 a year, representing about two million tons of waste paper.

"Were it not for the utilization of waste paper, there would be a depletion of the forests amounting to some 300,000 acres of virgin timberland every year. This is when account is taken of the fact that every six tons of waste paper produces the equivalent in pulp of an acre of virgin timberland.

"Two chief branches of the paper industry use waste paper—the paper board and the book paper mills. The book paper mills are dependent in large measure for waste paper of good grade for their mills. Old magazines, books, clippings, etc., are in demand for the manufacture of paper for magazines and book publishers. A large amount of new wood pulp is used in the manufacture of this paper but such book paper centers as the Kalamazoo, Mich., valley are consumers of huge quantities of waste paper.

"The paper board industry represents the largest total tonnage of any branch in the paper industry, with a total of over 2,000,000 tons of board manufactured in 1922.

"The Forest Products Laboratory at Madison, Wis., has been doing extensive experimenting with the de-inking of waste paper for the making of newsprint paper and this can be done economically, producing at the same time a satisfactory grade of paper."

D. H. Newell Returns To A. W. P. Co.

D. H. Newell, formerly manager of the Philadelphia office of the American Writing Paper company and later connected with the sales department of the general office at Holyoke, is again with the big fine paper manufacturing organization.

Mr. Newell, who is well known among paper men, will devote his efforts to selling Eagle-A papeteries especially with the trade formerly served by his predecessor, George Holbrook, who recently resigned.

With this new appointment, the American Writing Paper Company also announces the resumption of the management of its Chicago office by A. N. Forsythe, who successfully held that position for many years, as heretofore announced in these columns.

Paper Imports Break All Records

That paper imports during 1923 will break all records is shown by a compilation of Department of Commerce figures made by the American Paper and Pulp association of the import statistics for the first nine months of the year.

With nearly $35,000,000 worth of paper imported for the nine months ending with September, it is evident that the year's total will, if this rate of import is continued, reach $113,000,000. The nine months total is about equivalent to the highest previous year.

The totals are as follows, by months and by grades:

	By Months
January	$ 8,908,326
February	7,710,512
March	9,440,723
April	9,563,912
May	10,582,733
June	9,710,893
July	9,165,907
August	10,140,431
September	9,664,829
Total	$84,888,266

	By Grades
Newsprint	$72,493,213
Book	831,674
Board	2,367,649
Wrapping	3,147,864
Fine	467,629
Tissue	688,279
Hanging	426,172
All Other	4,465,786
Total	$84,888,266

Eddy Paper Co. Annual Meeting

Felix Pagenstecher, president of the Bryant Paper Company, Kalamazoo, Mich., and Charles A. Blaney chairman of the Michigan state prison commission, were elected members of the board of directors of the Eddy Paper Corporation at the annual meeting of the stockholders in Chicago. At the same meeting, Oscar Gumbinskey and Nathan Gumbinskey of Chicago and Arthur L. Pratt, former president of the King Paper Company of Kalamazoo, were retired from the directorate.

Excellent business during the last twelve months was reported by the secretary and treasurer. Improvements to the equipment and additions to the plant at Three Rivers and White Pigeon, it was said, resulted in a marked decrease in the cost of production.

The outstanding financial development of the annual meeting was the cancellation of 3,500 shares of preferred stock with a valuation of about $350,000. The increase in business in the last year was held to be so satisfactory that the directors could cancel the entire issue of preferred stock lying idle in the vaults of the company. This places the company's outstanding common stock, 125,000 shares of no par value common, in a much more satisfactory position with respect to the market.

Farmers To Use Lime Waste

Announcement has been made that an arrangement has been reached with the Nekoosa-Edwards Paper Company making available at Nekoosa, Wis., to the farmers of Wood county limestone suitable for agricultural purposes to be the amount of approximately 7,000 tons per year. This is regarded by farmers in the southern and southeastern parts of the country as promising the greatest impetus to the agricultural development of that region since it was first cleared for cultivation.

The acid condition of the light soils of central Wisconsin has long ago been recognized as the principal handicap to the successful and profitable cultivation of the region. Individual farmers have at times purchased commercial limestone and applied it to their fields, but the excessive cost has prevented this being carried on to any great extent. Beds of marl, a limestone clay, have been found in lakes and swamps in Portage, Waupaca, Waushara, Adams and Juneau and other neighboring counties, but so far as has been discovered there is none in Wood county and the difficulties of transportation made it unlikely that these deposits would be of much use to farmers in and around Nekoosa.

For these reasons the decision of the Nekoosa-Edwards company to make its limestone waste available to the farmers is of particular importance, and it is expected that the opportunity to obtain the material for the cost of hauling, with possibly a nominal charge in addition, will be taken advantage of throughout the region within easy hauling distance.

Under the arrangement reached by the country a with L. M. Alexander, president of the company, and Len Smith, general sulphite superintendent of the Nekoosa mill, the limestone waste will be deposited at a point where it will be available to farmers. The necessary equipment to make this change is now being installed by the company and will be in operation in about three weeks, it is expected. The Nekoosa mill is the only one in Wood county which uses limestone. About 20 tons are used there each day, amounting to about 7,000 tons per year.

Similar mill waste limestone from the mills of the Stevens Point Pulp Co., at McDill, and the Wausau Sulphite Fibre Co., at Mosinee, has been used for agricultural purposes to a certain extent, and has been found fully as satisfactory as any other form of lime. Inasmuch as commercial limestone costs Wood country farmers about $3 per ton, the annual saving, if the whole Nekoosa supply is made use of, will be about $20,000.

One of the chief immediate benefits which is expected to be derived from the newly available supply is the impetus it will give to alfalfa cultivation.

Tractor Demonstration Plans

The snow motor demonstration being arranged by the Woodlands section of the American Paper and Pulp association will be held at Piercefield, N. Y., late in December or early in January, through the courtesy of Col. W. E. Haskell and the International Paper company.

The Woodlands section in planning this demonstration is endeavoring to help the woods superintendents of paper companies to find economical methods of hauling pulp wood from the woods to rail heads or drivable streams. The motor to be demonstrated is a powerful machine with unique traction, developed by egg-shaped screw threaded drums, which in revolving develop unusual tractive strength. The manufacturers claim that it will negotiate six feet of snow without previous road making, that it can handle heavy loads on steep grades, and that it will revolutionize winter pulpwood operations.

Whether these claims can be substantiated will be demonstrated at the Piercefield test. The International Paper company has a 4,500 cord job with a stiff uphill haul at Piercefield, and another near by at Tupper Lake.

The paper mill men and woods superintendents who wish to see the demonstration can find hotel accommodations at both Piercefield and Tupper Lake.

The date has not been definitely set, dependent somewhat on the fall of sufficient snow to make the test a real try-out for this machine.

Final announcement of the test will be made in these pages.

It is semi-officially reported that the Crown-Willamette Paper company is planning to establish a small cut-up mill and a pulp plant on its holdings at Youngs river falls. This new plant is to utilize the small trees and the waste timber from its logging operations. If this plan is carried out electric power will be developed at the falls to operate these plants, the company's unloading facilities at tidewater and provide lights at the logging camps.

Durham Co. Receivership Dissolved

The Durham Paper & Pulp co., of Durham, Pa., has successfully had the appointment of a receiver for them dissolved by Judge Hand and Judge Lynch and a committee is now working out a plan of reorganization. Therefore, there is no receivership existing.

The company expects in the near future to have all their financial matters satisfactorily arranged.

This company owns and operates six different mills located at Hadley, N. Y., Napanoch, N. Y., Forestport, N. Y., Seymour, Conn., Rising Sun, Md., and Durham, Pa., and they specialize in kraft paper.

At the present time three of the mills are in full operation, Hadley, Napanoch and Durham.

Standards Committee of Fifteen

Many meetings were held during November by the five committees of three each, representing Superintendents, Technical and Cost associations and it is expected that the report to be made at the annual meetings of the three national associations in 1924 will be of great value to the industry.

General Chairman B. T. McBain is now checking up the results of the work to date done by the five separate committees.

New Type of Industrial Tractor

An internal gear drive for industrial tractors has been perfected by the Mercury Manufacturing company, Chicago, and after three years of experimental operation, a new model, the Type H, has been announced, featuring this drive. The results are striking in comparison with the worm drive models that have always been standard in tractor design.

The most important advantage is an increase—as demonstarted by elaborate tests—of 25 per cent to 35 per cent in efficiency compared with the Type L, the best of the worm drive models. These tests showed, for example, that at 200 pounds draw bar pull, the new model was developing an efficiency, indicated by speed and current consumption, 23 per cent greater than the Type L; at 600 pounds draw bar pull, 28 per cent; at 800 pounds draw bar pull 40 per cent, and so on. This increase in efficiency means an ability to run longer on one change, or handle heavier loads during the same length of time, or reduce the amount of the charge without reducing the reserve capacity of the batteries.

Type H Tractor

The second vital advantage of the new tractor is its remarkable serviceability. Five of the new tractors in service over two years have not required a single replacement part for the drive. It is claimed that this is a record never approached by worm drive tractors.

The elimination of the friction losses inherent in the worm drive has been the goal of Mercury engineers for a number of years, but it was only reached by solving many problems in the application of internal gear drives to this type of equipment. The most noteworthy feature of the new drive are the balanced arrangement of the driving years within the wheels; the method used to position these gears in relation to one another; and the successful attainment of an oil and dust tight enclosure for every moving part.

Collapsible Core For Newsprint

The Sherman Paper Company, at Felts Mills, N. Y., has been trying out a collapsible core in rolls of newsprint made at the mill, with extremely satisfactory results. The core was invented by George W. Dingee of Utica, president of the Empire Collapsible Core Company.

When the core is used the first few turnings of paper around it are pasted, making a paper core at the center. When the roll is completed the core is collapsed and removed, and the paper is shipped without a core. When the roll reaches the newspaper plant for which it is intended a duplicate of the collapsible roll is inserted in it, and the roll is run off on the printing press as at present.

Glue in Coated Paper

Warren B. Bullock, director of the information service of the American Paper and Pulp association, is sending out a bulletin in connection with the casein situation giving the following excerpt from information received by the bureau from Washington:

"The Bureau of Standards is carrying out some experiments dealing with the use of glue in coating paper. During the past month nine runs have been made on the experimental coating machine, using two makes of bone glue for eight of the runs and a French casein glue for one. The clay used for all runs was Lee Moor, a good grade of English coating clay, The results indicate that the water resistance of glue-bound coating containing chrome alum compares favorably with that of casein-bound paper containing no formaldehyde.

"It is believed that the degree of waterproofness will prove sufficient for most of the papers used for halftone printing. Difficulties have been experienced in obtaining a uniform coating, because of variation of the fluidity of the coating mixture and mechanical defects in the machine, so that additional work will be necessary before paper suitable for printing tests can be produced.

Paper Pulp from Straw

Considerable interest has been aroused in England over experiments at Northfleet, Kent, for the chemical treatment of waste straw for conversion into paper pulp.

In connection with this scheme, Sir Frederick Becker, who has introduced much Canadian pulp on the British market ,is now in Canada making further investigations.

In a statement on the subject before leaving England Sir Frederick Becker pointed out, as a striking fact concerning the millions of Canadian acres under cultivation, that practically the whole of the enormous yield of straw is a waste product, a good proportion of which is annually burnt. If, however, the experiments to be carried out in Kent are as successful on the big scale as they have been in France, he estimates that it will be possible to buy all the straw from the Canadian farmer and convert it into pulp in the prairie provinces for the manufacture of high grades of paper.

L. W. Sutherland, president of the Sutherland Paper Co., Kalamazoo, Mich., has been elected a director of the local Chamber of Commerce.

Forestry in the Paper Industry

Conducted by J. R. Simmons, Secretary Forester,
The New York State Forestry Association

Chamber of Commerce Referendum

Results Show that Seven of the Eight Proposals for National Forest Policy Carried by Wide Margin

To assure a permanent future supply of timber, the Chamber of Commerce of the United States has advocated the adoption of a broad national forestry policy. The chamber's position is taken as a result of a referendum vote just completed among more than 1,300 business organizations making up the national organization's membership.

A preliminary canvass of votes cast shows that seven out of eight specific proposals contained in the referendum carried by a wide margin. The recommendation which was not endorsed provided for the setting up of a national forest advisory council, and more than 700 votes were cast in favor of even this paragraph.

Commercial and industrial organizations in forty-seven states, the District of Columbia, Hawaii, Cuba and Haiti participated in the referendum.

The paper industry is in the position of having carried its forestry campaign through this central organization of American industry, as the referendum is the outgrowth of a program for a forestry policy inaugurated in the fall of 1920. It was the paper industry's action that led to the formation of the National Forestry Program committee, which in turn was largely responsible for inducing the national Chamber of Commerce to make a study of the forestry question. Prominent paper men served both with the National Forestry Program committee and as members of the committee which made the investigation for the Chamber of Commerce, as pointed out in recent issues of Paper.

The recommendations submitted and vote on each follow:

I. "That the federal government should, for protection of headwaters of navigable streams and to the extent permitted by existing law, acquire, reseed, and replant waste lands on which reproduction of forest growth cannot be obtained by natural means, with discretion in the Secretary of Agriculture to prefer lands in states which provide at least an equal amount of funds for acquisition of such lands. FOR 1887; AGAINST 201.

II. "That states and municipalities should acquire, reseed, and replant the remainder of such waste lands. FOR 1887½; AGAINST 196½.

III. "That Congress should exact new legislation with reference to other classes of timberland, to make provision for cooperation of federal government, state governments, and timber owners in protection and reproduction of timber. FOR 1724; AGAINST 356.

IV. "That such new federal legislation should condition use of federal funds upon the state:

Having a forestry or conservation commission:

Formulating a code of forest management acceptable to the federal Department of Agriculture and aimed to secure continuous forest production, observance of the code to be obtained through voluntary agreements entered into between the proper public authorities and the land or timber owners of considerable areas within the state.

Maintaining adequate protection of timberlands from fire, with funds coming from state and private sources at least equal to federal funds used for this purposes.

Basing taxation of growing timber upon the principle of the yield tax, with reasonable uniformity among the states in such taxation. FOR 1556; AGAINST 523.

V. "That Congress should create a national forest council to have functions of advice to administrative officials and a membership of nine, one to be the federal forester and the others to represent views of public, timber men, and foresters, members of the council to serve without remuneration. FOR 1358½; AGAINST 701½ NECESSARY TO CARRY 1373; NOT COMMITTED.

VI. "That Congress should provide for a national survey and inventory of forest resources. FOR 1761½; AGAINST 292½.

VII. "That Congress should increase the federal appropriations available for protection of timber lands against fire. FOR 1987½; AGAINST 98½.

VIII. "That Congress should provide for enlargement of federal research and experiment in forest products. FOR 1908½; AGAINST 164½."

Our Forests That Were

Under the above title, B. T. McBain, assistant general manager of the Nekoosa-Edwards Paper company of Port Edwards, Wis., presented a statement on forestry as related to the paper industry, before a conference held at Wausau, Wis., on November 24th. It will be recalled that Mr. McBain was recently elected secretary-treasurer of the new Wisconsin Protective association the purpose of which is to develop a program of scientific forest taxation, adequate fire prevention and reforestation.

Wide reading and investigation have enabled Mr. McBain to concentrate, in a comparatively short paper, a wealth of information on what this country originally possessed, and the chief causes leading up to the decline of that heritage to one-sixth of its former grandeur. He frankly states that there is needless waste of wood in all wood-using industries and that the pulp and paper industry is no exception.

The statement contains some sound recommendations on forestry policy, among which the following may be quoted as indicating the viewpoint of a man long engaged in the paper and pulp industry.

"It has been proven that correct handling of private forests cannot be secured by education alone. It is necessary that suitable measures be adopted to induce private owners to preserve and protect their woodlands.

1st. The timber must be protected against forest fires.

2nd. Timber must be so cut as to aid natural reforesting.

3rd. Cut over lands must be reforested either naturally or by tree planting.

4th. Tax laws must be changed to induce owners to go into the wood growing business.

"The lumberman should practice forestry. They can do so by practicing better methods. They can harvest their crop without so much injury to the future generation. They can do more toward prevention of fires. They can and should plant trees.

"The pulp and paper mill owners who also own timberlands come within this class. Those who use timber products, but own no timber, should aid in the work of reforestation because by that means alone can they perpetuate the forests and their supply of raw material.

"The farmer should practice forestry because a tree crop is a profitable crop. Farmers should prize their woodlands because they not only provide building material for fences but supply fuel for the farm house. Any surplus can always be sold in the form of standing timber, saw logs, posts, poles, ties, or pulpwood in cordwood or bolts."

In conclusion Mr. McBain quotes a trite sentence from C. L. Pack's book on forestry:

"If we are to remain a nation of timber users, we must become a nation of wood growers."

Good Argument for Seed Trees

Experiments conducted by the Forest Service, United States Department of Agriculture, show that in the southwest yellow pine seed trees left after logging grow about twice as fast as similar trees in virgin forests.

In marking timber on departmental sales in the western yellow pine region in Arizona and New Mexico large mature trees are often retained to produce seed. A great many of the trees of this type are also defective in some way because of past fires or some injury from other causes.

In order to determine the rate of deterioration in trees of this type, the Fort Valley Forest Experiment Station in Arizona began a study in 1910. Thirty-three trees ranging between 26 and 42 inches in diameter were selected in old growth stands near the experiment station, and 34 trees between 32 and 38 inches in diameter on a nearby area which had been cut over 25 years previously were measured at the same time.

These areas were reexamined in the fall of 1922, and it was found that eight trees or 24.2 per cent of the total number in a virgin stand, had died during the 12-year period, while only one, or 2.9 per cent of the total number on the cut-over area, had died. The lower mortality on the cut-over plot was ascribed chiefly to the fact that the trees were more thrifty than those in the virgin stand.

Wisconsin Forest Protective Association

A meeting of the board of directors of the Wisconsin Forest Protective association was called by President D. C. Everest and the meeting was held at the Bellis house, Wausau, Wis., on Thursday, November 22nd.

The main subject for discussion was the proposed Article of Association and after careful consideration the draft was made up. Secretary McBain was instructed to send copy in duplicate of these to each and every member of the association, requesting their signature, the return of one copy together with a statement of their last year's consumption of pulpwood or logs or both.

The problems of forest protection were thoroughly discussed and it was decided that the president would call a meeting in Chicago of the association members as soon as all had returned their signed articles of association and consumption figures.

The following is a synopsis of the Articles of Association:

A voluntary association of timber owners and users of the State of Wisconsin in view of the rapid depletion of the forest resources within that State and the importance of conserving the forest resources on the remaining timbered area, and the further importance of encouraging the growth of timber on cut over areas in this section of the United States, the undersigned persons or corporation interested in the production or consumption of forest products within the said State of Wisconsin band themselves together.

That the directors shall meet on call of the president and have power to assess the membership up to a maximum amount per cord of consumption per annum.

That the membership may be corporate or individual.

The purposes as set forth are the protection from fire and other protection of growing timber; to aid in the propogation of timber for the wood using industries of the State; and the directors are instructed to use any and all legal means for arriving at these desired ends. The association has also the power to transact any and all other business as may properly be the business thereof.

The annual meeting will be held in Wausau the fourth Tuesday of September.

There are the usual regulations for officers, including the bonding of treasurer, and membership is for one year under certain conditions.

Forestry Profession in New York City

With the summer's work in the field ended, New York City foresters organized as the New York Forest club have resumed their monthly luncheon meetings, and the first gathering held in November will be followed by another December 18 at the Canadian club. The club has a list of between 50 and 60 foresters in or about New York city, many of whom are actively practicing their professions. Others with forestry training are engaged in other lines of work, but still maintain their interest in the profession for which they were trained.

At the November meeting there were sixteen present, and the work of the American Forestry association was discussed by two of the directors, Ernest A. Sterling and N. C. Brown. Dr. Hermann Von Schrenk of St. Louis told of forestry work in Missouri, and the National Chamber of Commerce Referendum was discussed by Dr. Hugh P. Baker, who pointed out the divergent comments of Gov. Pinchot and Col. Graves.

A program committee to plan for the winter's meetings was named, consisting of Julian Rothery, chairman, W. E. Murchie and E. C. M. Richards.

Standing Timber in Oregon

A map of Oregon recently printed in one of the large daily newspapers of Portland, Oregon, was divided into north and south sections by a line running east and west but this line was a little south of the center of the state. The northern section was divided by a line east of the Cascade mountains which ran north and south parallel with the mountains.

In each of the three divisions thus made was placed an estimated amount of the timber therein. The northeast division has 43,933,000,000 feet of standing timber; the northwest division has 339,751,000,000 and the southern division of the state has 84,327,000,000 feet.

Atmospheric Humidity Restrains Fires

Atmospheric humidity discourages forest fires. This is the finding of E. F. McCarthy, silviculturist of the Appalachian Forest Experiment Station at Asheville, N. C., who has written an article on his investigations for the Monthly Weather Review. His studies are a verification of those conducted by the foresters on the Pacific coast.

Vol. XXXIII December 13, 1923 No. 8

The Second Paper Industries Exposition

The pulp and paper industry of the United States is once more afforded the opportunity of emphasizing its extent, economic importance and position among the great basic industries of the country. During the week of April 7, 1924, in conjunction with the annual convention of the American Paper and Pulp association, it is planned to hold the second Paper Industries Exposition, at which will be shown the numberless productions of pulp and paper and related articles that are manufactured in the mills and converting plants of the United States and Canada. Not alone these, but the machinery, equipment, power devices, etc., that have been developed for the use of the industry during recent years.

The meeting of the association will be held at the Waldorf-Astoria hotel and the exposition will be held in the Grand Central Palace. Announcement is made by the exposition management that the entire first floor of the Grand Central Palace will be devoted to the exposition and, if necessary, the second floor will also be used.

About one-fourth of those who had exhibits at the first paper exposition have already reserved space in the second show.

An advisory committee from the paper industry has been formed and its first meeting will be held before December 22. In the meantime preparations are under way to inaugurate an active campaign that will bring the exposition to the attention of every paper manufacturer and every producer of equipment and supplies for the paper industry, with a view to making the second paper exposition a representative and comprehensive exhibit of everything connected with the production of paper.

The exposition has the active support and cooperation of all the progressive manufacturers of paper as well as that of the producers of machinery and equipment.

The far-seeing men in the paper industry recognize in the exposition a forceful means for laying before the general public concrete evidence of the vast magnitude of the industry and its importance to all lines of business.

The ancient idea that the interest and natural curiosity of the public, to say nothing of its exaggerated misconceptions, could be safely ignored, has been thoroughly exploded. The support of public opinion is necessary in order to secure legislation for the preservation of the industry and the exposition is one excellent channel through which the public may be reached. It is, therefore, incumbent on the progressive concerns engaged in papermaking to do their utmost to assist in this educational movement.

There is another phase of the exposition which should appeal with equal force to paper manufacturers and that is the opportunities it offers for examination and study of new equipment and processes as shown by the exhibits of machinery, etc. Opportunity will be offered for comparative study of various devices and processes that could only be secured otherwise by many trips to distant points and with little opportunity for comparison.

Dard Hunter—Master Craftsman

IN the succeeding number of PAPER will appear an article by Dard Hunter, of Chillicothe, Ohio, on the significance of early papermarking which will form a notable contribution to the subject.

As an artist, craftsman and historian of handmade paper manufacture, Dard Hunter has no rival among writers in English and few in any other language. For many years he has enriched the literature of papermaking with the results of his painstaking researches on handmade paper and its watermarks and he is, indeed, the only writer in English who has written on the subject from a technical standpoint.

Every student of the history of papermaking is deeply indebted to Mr. Hunter for the monumental bibliography of the art of handmade paper which he contributed originally to this journal in the form of a report to the Committee on Bibliography of the Technical Association of the Pulp and Paper Industry under date of April 14, 1917. This invaluable reference work will be found in PAPER for May 30, 1917, pp. 20-26.

New Developments in Paper Making

Manufacture of Glazed Paper

According to British patent No. 202,479 glazed paper is made by subjecting the sheet of paper to heat and pressure, during which period it is momentarily brought in contact with a thin sheet of copper which glazes and cools the paper.

* * *

Composition for Treating Paper

In United States patent No. 1,468,831, which is assigned to the S. H. Parrish Co., there is described the manufacture of a composition used in treating paper. This composition is made by mixing together one part of soya bean oil with three parts of tetrachloride of carbon, eight parts of fir balsam with four parts of turpentine and then adding the two solutions together.

* * *

Irridescent Coatings

British patent No. 202,835 is concerned with a process of producing irridescent coatings on paper. The coating consists of a film formed by the spreading and evaporation of a solution on the surface of water. The solution is composed of nitro-cellulose or cellulose acetate, to which gums or resins may be added, dissolved in a fatty acid or without the addition of alcohol or acetone. The paper to be coated is drawn upwards through the solution on which the film floats, so that the film adheres to the paper.

* * *

Paper Calender

In this calender the rolls are arranged side by side horizontally. Each roll has a pulley at one or both ends. A belt passes over and under the various pulleys. An idler pulley varies the tension on the belt. This arrangement relieves the rolls of their own dead weight, and enables pressure to be regulated and graduated according to requirements. Slitting knives are provided so that the paper may be cut to various widths while being calendered. For further details see British patent No. 202,753.

* * *

Waterproof Material From Paper

The cellulose material that is to be made waterproof is immersed in a concentrated solution of a chloride of an alkaline earth metal or of zinc or aluminum, to which solution a small quantity of zinc peroxide or sodium perchlorate, or a hypochlorite or a persulphate has been added. In the presence of such oxidizing agent, which acts as a catalyst, the cellulose present in the fiber is partially hydrolyzed to soluble amyloids when the saturated material is heated on rollers to a temperature of 90 degrees C.

The fiber is then treated with dilute caustic soda solution in order to coagulate the amyloids and thus render the whole waterproof, and well washed to remove the hydrolyzing salt and the catalyst. This process is patented in German patent No. 377,659.

* * *

Washable Printing Paper

The improved method of manufacturing paper for printing maps, charts, etc,, which is patented in British patent No. 202,883, consists in passing the paper, through a preliminary bath of size so as partly to impregnate it. Then the partially impregnated paper is passed between pressure rolls to complete the impregnation.

After a period of several hours a hardening solution is applied and the paper is rolled up and allowed to remain for several hours more. Before drying it is cooled in a current of air. An addition of alkali or acid to the sizing solution increases the absorption. After the hardening process the paper may be treated with glycerin to soften it and then it is finally varnished.

* * *

Purification of Cellulose

German patent No. 378,260, which is assigned to Dr. Schwalbe, is concerned with a process for the purification of cellulose from pentosans. Cellulose which has been bleached is heated with a sulphite solution, for example magnesium sulphite solution, in the presence of metallic oxides such as lime or magnesia. Pressure may or may not be applied. Practically all the lignin and most of the pentosans present are removed in this manner, especially if the above treatment be followed by a second short bleach. Hitherto there has been no ready method of obtaining cellulose almost free of pentosans.

* * *

Treating Waste Soda Pulp Liquor

The process which is described in United States patent No. 1,442,494, and which is intended for the purification of waste soda pulp liquor wherein a liquid waste material containing combined carbon is obtained and subjected to further treatment, is assigned to the Jessup and Moore Paper Co.

Waste material which contained combined carbon, such as the liquor from the soda pulp process, is evaporated in an incinerator evaporator of the usual type. The residues are leached in order to remove the soluble salts which are then recovered. The carbonaceous sludge which remains is dried by the hot gases which come from the incinerator. In passing through the dryer these gases are freed from any suspended matter that they may happen to contain and the latter is collected and returned to the incinerator.

The dried carbon is fed into a powdered coal apparatus of the usual type and the fuel obtained in this manner is used to heat the incinerator. It may be necessary to supply some outside heat to the process, especially to the dryer.

* * *

The Efficiency of Felts

To choose a felt intelligently it is necessary to have in mind the functions it has to perform. Its first function is that it should act as a transporting band, the second that it should absorb water easily from the paper, the third that the water should readily pass through it, and the fourth that its face should be a guard against felt marks. There are also other points, such as the life of the felt, its dirt resisting qualities, its ability to withstand the effect of roping and the effect of washing off the machine, etc.

The ideal felt would last as long as a drying cylinder and require no more attention, would never interfere with the production of good paper, or get dirty, or change its condition, or wrinkle, or run ashore, or out of square. From the standpoint of the machine man an ideal felt would be one that never required washing until the next shift, or changing until the week-end. It is easy to see that it is impossible to satisfy these requirements.

The author of this paper, which is abstracted in Paper Making and Paper Selling, describes a method for cleaning the felt and keeping it in constant good condition for paper making.

Rapid Analysis of Paper

(Continued from page 9)

$$\text{Straw stock} = \frac{100(6.45-0.5)}{13-0.5} \quad \text{or 47.6 percent}$$

$$\text{Rag stock} = 100-47.6 \quad \text{or 52.4 percent}$$

Determination of Furfurol by Phloroglucin

This method, which possesses a sufficient degree of accuracy, has the advantage of being rapid and is suitable for use in the great majority of cases.

It is based on the Kroeber reaction, that is the precipitation of furfurol in acid solution by phloroglucin. The standard solution of phloroglucin is prepared by dissolving five grams of the substance in one liter of a hydrochloric acid solution of 1.06 density. The distilled liquor which contains the furfurol is then diluted to give the same density reading on the hydrometer and is heated to a temperature of from 65 to 70 degrees C.

The standard phloroglucin solution is added from a graduated burette. A black precipitate is formed. The reaction is complete when a drop of the liquor containing furfurol gives a rose colored reaction on a spot plate. This denotes an excess of phloroglucin.

The standard phloroglucin is titrated beforehand with a solution of furfurol so that the value of each cubic centimeter in terms of furfurol is known. This factor is multiplied into the number of cubic centimeters used and in this way the weight of furfurol obtained from a unit weight of paper is obtained. This figure is then used in the same manner as indicated above to determine the proportion of different fibers in the paper.

(To be continued)

Treatment of Grindstones

(Continued from page 5)

up the grit of a stone that has glazed over and also for removing streaks from a stone that has been burned.

If the stock from any stone is too free or rough it is often improved considerably by running a fine diamond lightly over the face of the stone that is producing the undesirable stock. The groundwood produced by a diamond burr has the objection of containing a very large number of slivers and sawdust-like stubs, which show up plainly in the finished sheet of paper, causing cracks on the edges and spots or open places in the body of the sheet.

The Hall Process

Two types of burrs are often used in combination with each other and in this manner the good points of both types are brought out and a very desirable stock obtained. The best known combination of burrs is the No. 4 straight cut with a 10, 12 or 14 diamond, the diamond selected according to the freeness of the stock desired. This combination, employing a flat bottom straight cut, is known as the Hall process.

In the foregoing combination the diamond burr does the cutting and the straight cut provides a recess for the stock ground to escape from the stone and minimizes regrinding.

Good Business To Be the Rule

"Basic business conditions are good, and the paper industry should expect to receive its normal share of the business activity," says the monthly review of business by the Paper and Pulp Industry, the bulletin of the American Paper and Pulp association.

"Despite some uncertainty in the country's business—unjustified as such uncertainty is by basic conditions—the paper industry is not altering its belief that good business is to be the rule for months to come," says this review. "This sentiment, expressed during the fall business conference at Chicago, seems to be justified by the general improvement in the volume of business since the middle of October. The statistical report of production for September, compiled by the American Paper and Pulp Association, showed an unexpected falling off of production, following an increase in August to above normal for the summer months. It is probable, however, that the October summary will show an increase of production over September."

Work has been commenced on a new concrete dam to replace the old wooden one at the Sturgeon river mill of the Spanish River Pulp and Paper Mills company. The work will be carried on throughout the winter without interruption in manufacturing operations.

Modern Methods

in our mills constitute one of the reasons for Appleton efficient service and fine quality.

The latest and most improved machinery with skilled workmen and the best wool obtainable, guarantee Appleton superiority.

BELT CONVEYOR
Properly applied, the belt conveyor offers an ideal solution of the conveying problem.

Do You Handle Your Coa

TIME, labor and money are saved in handling coal to the boiler house—to a greater extent than the average manufacturer appreciates.

Unloading, loading, storing and reclaiming coal, conveying it to the bunkers, and disposing of the ashes, involve problems that often bother him. It looks so simple and easy. He sees many standard systems and devices, the merits of which appeal to him as good solutions of his problem.

And yet, after the equipment he chose is installed and used, it becomes apparent that something is lacking. The plan would have been more effective if the equipment as a whole were especially selected, or designed, to fit his peculiar conditions.

That is why the experience of Link-Belt engineers, extending over more than 40 years in this work, can be of value to the average manufacturer, and his engineer.

Chain-and-bucket conveyors, belt conveyors, skip hoists, flight conveyors, screw conveyors, gravity-discharge elevator-conveyors, are all excellent types of equipment. Locomotive cranes, crawler cranes, bridge tramways, unloading towers, portable bucket loaders and portable belt conveyors, power hoes (drag scrapers) are all recognized standard machines for loading, unloading and storing coal. All are well-established standards. Yet, it is upon their application to the local conditions that their effectiveness and economical operation depend.

LINK-BELT COMPANY

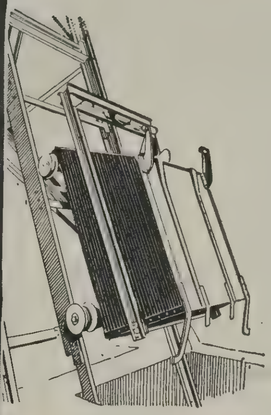
The Link-Belt Skip Hoist is the result of 20 years' experience in building this type of equipment.



fficiently and at Low Cost?

t is here that the unbiased judgment of Link-
elt skilled engineers is, in the long run, a
afe thing to follow.

ur position is unique. We manufacture in
heir entirety, in our own plants, all of the
arious approved types of equipment used in
he handling of coal. Our designs, therefore,
re made without prejudice, and are unin-
uenced by a desire to force the use of some
articular type of equipment, to which we
ight be restricted by patterns or facilities, or
o which we are committed by costly exploita-
ion.

ocal and individual conditions have a very
nportant bearing on the determination of
hat equipment is most advantageous. For this reason standardization of general designs is desirable only to a limited extent.

We have carried to the highest point of standardization the design of the various types of equipment, so that we may insure the minimum cost of production; and our engineers adapt these various standardized devices in the best possible manner to the conditions of the purchaser.

Therefore, if planning to store coal, or change your present method of getting coal into the boiler house, let us work with you, and your engineer. Take advantage of our vast experience in designing and building hundreds of small and large plants throughout the world. It is yours for the asking.

Doings in Canadian Paper Field

Victory for Bathurst Company

One of the most far reaching judgments effecting the pulp and paper industry in Canada was delivered recently when the appeal of the New Brunswick Workman's Compensation Board was dismissed.

The New Brunswick Workman's Compensation Board had appealed from the decision of the lower court that the board had not established a case against the Bathurst Company of Bathhurst, N. B., manufacturers of pulp and paper. The board had sued for $62,000, which it had levied against the company in compensation taxes. The company had refused to pay on the grounds that it had a compensation system of its own which the board refused to recognize; that the board was extravagant, and expensively operated; that the system was inefficient, inasmuch as the entire burden was placed on the employer.

The lower court had adjudged that the company had properly refused to pay the levies. The board took the case to the New Brunswick supreme court and the judgment of that court is that no appeal will be granted. The board may appeal to the supreme court of Canada, and to the privy council at London, if necessary.

For some years the pulp and paper industry has been carrying a very heavy burden in the New Brunswick Workman's Compensation Board which has been known as the most extravagantly operated compensation body in existence. The board seemed to single out the pulp and paper industry for special attention when desirous of increasing compensation taxes.

However, the Bathurst company, which is one of the most important of Canadian pulp and paper manufacturing concerns and which is controlled by U. S. capital, proved a worthy fee. The company has consistently refused to pay the levies and the executive of the firm was not discouraged by two rebuffs received at the opening of the legal warfare when two court decisions were recorded in favor of the compensation board.

The Bathurst company recently opened a new paper mill at Bathurst and enlarged its pulp mill. The company has also built tidewater decks and bought very large tracts of pulpwood land in northern New Brunswick and Quebec.

The company intends to fight the exorbitant levies to the end and will continue the litigation if necessary. That there must be relief for the pulp and paper industry is realized.

More Embargo Discussion

At a recent meeting in Dryden, Ont., of those interested in pulpwood a resolution was adopted to the effect that those interested in the sale of pulpwood would regard the proposed embargo as detrimental to their interests by restricting the market for wood. At the same time they recognized that if the duty at present imposed by the United States on kraft paper could be reduced or entirely removed, the resulting benefit to Canadian mills would go far to improve the lot of the settlers by providing a home market for their pulpwood and other products.

H. F. Bullard, general manager of the Dryden Pulp and Paper company, assured the meeting that as far as his company was concerned there was no desire to interfere with their freedom to deal wherever their interests dictated. The problem of the Canadian mills, he said, was not one of supply of raw material but one of wider markets for their products. Although they supplied a large portion of the western market that, after all, was a very restricted market compared to the immense market to the south. As long as raw material from Canada could reach American mills duty free and they were protected by a 30% tariff, the inequality would be to the serious disadvantage to manufacturers on this side.

Canadian Mill for American Company

Engineers of the Hollingsworth & Whitney Paper Co. of 185 Devonshire street, Boston, Mass., are making borings and tests for foundations for the pulp and paper plant to be erected at St. Stephens, N. B., just across the river from Calais, Me. The company recently made extensive purchases of property at the lower boundary of St. Stephen on both sides of Porter Mill stream and more recently purchased water rights at Milltown, N. B., to operate in connection with the project.

The company already has mills at Waterville, Me., and Gardiner, Me., owns extensive timber acreages around the head of Moosehead lake, Me., and also recently acquired extensive holdings of timberland on the Canadian side of the upper St. Croix river and elsewhere in the maritime provinces.

The Central Paper company, a corporation under the laws of Michigan, was recently granted an extra Ontario provincial license to manufacture and deal in pulp and paper in the province of Ontario and to invest any sum up to one million dollars. A. C. Boyle, of Fort William, is the Ontario representative of the company. H. E. Jones, secretary of the company at Muskegon, Mich., states that while the company has taken out an Ontario license they have not yet completed arrangements as to their operations beyond the development of the timber limits they have acquired.

J. W. Defoe, editor of the Manitoba Free Press, Winnipeg, was in Toronto last week on his way home after having attended the Imperial conference in England. Mr. Defoe stated that there was a great field in Europe for Canadian made papers which Canadian paper manufacturers should concentrate upon. He expressed some pessimism over the economic conditions of Great Britain and ventured the opinion that the present election campaign there would result in a stalemate.

The Quebec Official Gazette contains a notice that Messrs. Price Bros. & Co., Limited, of the city of Quebec, intend to apply for authorization to have constructed a dam and hydro-electric power house on the Chicoutimi river. Reports are also current to the effect that Price's may take over the Saguenay Pulp interests. Both are operating side by side in the Lake St. John and Chicoutimi and have much in common.

The Abitibi Power and Paper Co.'s mill set up a new record in September when a daily average production of 583 tons was established. This was the more noteworthy in that it was only a 27 day month.

Construction News

Boston, Mass.—The Hollingsworth & Whitney Co., 185 Devonshire street, manufacturer of paper, with mills at Waterville and Gardiner, Me., is perfecting plans for the construction of a new plant on site acquired some time ago at St. Stephen, N. B., on the St. Croix river, opposite Calais, Me. The mill will consist of pulp and paper units, with power house, machine shop and other auxiliary buildings, and is reported to cost about $500,000. Test borings for foundations will be made at once and it is proposed to break ground at an early date. The present plants will be continued in service.

Fort Miller, N. Y.—The Fort Miller Pulp & Paper Co., has plans for the construction of a new pulp mills, with initial capacity of 100 tons per day, to be operated by water power. It is estimated to cost close to $200,000, with equipment. S. A. Thorpe is general manager.

Dalton, Mass.—The Eaton, Crane & Pike Co., Pittsfield, Mass., has acquired the fine paper business of the Z. & W. M. Crane Co., Dalton, and will take over the property on January 1. It is understood that the transaction does not include the machinery and equipment at the Dalton mills, and that the plant will remain equipped, in its present condition, for the time being.

Astoria, Ore.—The Crown-Willamette Paper Co., Pittock building, Portland, Ore., has tentative plans for the construction of a new pulp mill on site selected at the Youngs River Falls, near Astoria. It will consist of a main operating unit, estimated to cost in excess of $125,000, including equipment.

Stillwater, N. Y.—The Wood-Flong Paper Corporation is planning for the installation of equipment for its machine shop, including lathe, pipe threading machine and other apparatus. The compnay is also said to be considering the installation of a number of beaters and auxiliary equipment at the mill. C. W. Townsend is general manager.

Freeport, Me.—The Baxter Paper Box Co., is completing the remodeling of the former local high school for a paper box and container factory, and plans to commence operations at an early date. Equipment will be installed immediately. It is said that the plant will give employment to about 50 operatives for initial production.

Kenora, Ont.—The Backus-Brooks Co., is making ready for operations at its new plant and will place the first unit in service at an early date. The plant will be devoted to the production of newsprint. Other plant units will be constructed at a later date, until the mill is one of the largest plants in the country for newsprint manufacture.

Chicago, Ill.—The South Side Paper Co., 5838 Throop street, is perfecting plans for the rebuilding of the portion of its two-story and basement plant, recently destroyed by fire. It will cost approximately $25,000. Robert Colbus is president.

Monroe, La.—The Brown Paper Mill Co., is pushing construction on its new local plant, to be used for the manufacture of kraft papers, and purposes to have the initial units ready for service early in the coming year. The mill will have a daily output of about 65 tons of pulp and paper per day, and will represent an investment in excess of $1,000,000. Natural gas will be used for fuel.

Norwalk, Ohio—The Universal Paper Products Co., is reported to be negotiating for the sale of its local plant to the Norwalk Enamel Products Co., which will remodel and improve the plant for another line of production. The future plans of the Universal company have not as yet been announced.

Doings in Canadian Paper Field

Favors Export Duty on Pulpwood

Basing his study of the tariff question on the effect upon the pulp and paper industry of Canada, H. F. E. Kent, president of the Canadian Pulp and Paper association, in an address before the Ontario division of the Canadian Manufacturer's association in Toronto last week, declared that, on account of inadequate protection importations of paper into Canada had averaged nearly $8,000,000 a year for the past ten years.

"The time is ripe for a new stock-taking of the situation in Canada with regard to pulpwood," he said, claiming that the pulpwood resources were being at present depleted at a terrific rate. No one could gainsay the wisdom of keeping as much of the raw material as possible within Canada. Pulp exported from Canada returned as paper to compete with the Canadian product. He favored an export duty which would compel manufacture within Canada.

Forestry the Only Solution

In an address at a recent luncheon of the Canada Paper club in Montreal, George Carruthers of the Interlake Tissue Mills of Toronto, spoke strongly of the necessity of closer co-operation between pulp and paper interests.

As vice-president of the Canadian Pulp and Paper association he frankly stated that the paper interests were using up Canadian forests far quicker than trees could be produced, and unless a better method of conservation were worked out, the Canadian paper industry would be up against a bad situation.

The solution lay in forest conservation and re-forestation. He said it was practically impossible for private interests solely to undertake the latter work, and the Government would have to shoulder the greater part of it. Three times as many trees were being destroyed by fire and pests as by the paper industry.

Red Tape Forces Shutdown

For the first time in its history the Kam Power company at Fort William was unable to deliver a sufficient load of energy and as a result 150 men were laid off by the Fort William Paper company last week. The firm resumed operation the next day and it is expected that the shut-down for the present will only be one day a week.

Meanwhile Sir Adam Beck, chairman of the Hydro Electric Power commission of Ontario is adamant in his proposition not to supply hydro power to the Kam Power company unless the city of Fort William officially applies for it and agrees not to interfere with hydro service to Fort William. The city has taken the stand that the matter of power lies between the two developments and is not a matter of civic participation.

Canadian Briefs

The Glengarry Pulp and Paper company, Cornwall, Ont., which was organized some time ago and is in operation, has been formed into a limited liability company by Ontario charter, with an authorized capital of $250,000.

Circulars issued to the printing trade by the Canadian Paper Trade association announce a change in terms. The old terms were 2% 30 days, net 60 days and under the new arrangement, beginning January 1 next, the terms will be net 30 days from the first of the month following shipment and a discount of 2 per cent will be allowed only if paid not later than the 20th of the following month.

Fred W. Halls, of the Fred W. Halls Paper company, paper jobbers, Adelaide street, Toronto, has returned from an adventurous hunting trip, bringing with him a deer and a wildcat. He was up on the Algoma Central railway, sixty miles west of Sudbury.

Kay Crabtree, who has been general superintendent of the Crabtree division of the Howard Smith Paper Mills for several years, has taken charge of the sales of the surplus bleached groundwood and bleached and unbleached pulp produced by the company. A banquet was given in his honor a few days ago by the employes of the Crabtree division and the men were out en mass. Aubrey Crabtree presided and Thomas Parks presented the guest with a handsome watch and at the same time expressed the cordial good wishes of the gathering for Mr. Crabtree's continued success.

Pulp and paper companies of Canada are endeavoring to stimulate the paper market in Australia. Premier King of Canada, who is now in England in conference with the premiers of the other British dominions, has been endeavoring to reach some agreement with the Australian premier whereby the Australian paper market will look with greater favor than previously on Canadian paper. At present the Australian market is none too good, which is attributed to the British preference. However, indications are not looking that improvement is in sight.

The Pejepscot Pulp and Paper company, with head offices in New York City and paper mills in Maine, have started the winter pulpwood cut. This company controls vast tracts of pulpwood land and has also some crown lands leases along the Bay of Fundy shore between the Salmon river and the Petitcodiac river. At Salmon River, this company is enlarging its operations. It maintains a mill, camps and offices at Salmon River. It is from Salmon River that shipments are made by barges towed by the company's tugs to the Maine paper mills at Bath and Belfast.

The Canadian Vegetable Parchment company, Limited, St. Catharines and Merritton, Ont., had an extensive and attractive exhibit of Purity parchment at the Royal Winter Fair in Toronto last week. Their booth was attractively decorated with samples of the firm's product and a feature was a guessing contest which centered round the weight of a huge bale of parchment paper which had been especially packed for the occasion.

During October the Canadian newsprint industry set up another high record for newsprint production, having turned out 114,475 tons, as compared with 113,584 in August, the previous high mark. The shipments from Canadian mills also made a new record, having been 112,996, as compared with 112,818 in August. This average daily production was, however, about 30 tons a day below that for September, though it was 420 tons a day ahead of that for January.

Construction News

value, to manufacture and deal in paper products. The incorporators are Fay R. Hunt and Frederick U. Weigert, both of Providence.

Red Bank, N. J.—The Whitfield Paper Works, Inc., has been incorporated with a capital of $200,000, to manufacture paper products. The incorporators are Howard Whitfield, F. Standlinger and Warren H. Smock, 75 Broad street, Red Bank. The last noted is representative.

Wilmington, Del.—The H. Reeve Angel Co., Inc., has been incorporated with a capital of $100,000, to manufacture and deal in paper products. The company is represented by the Registrar & Transfer Co., 900 Market street, Wilmington.

New York, N. Y.—The O. R. O. Envelope Mfg. Co., has been incorporated with a capital of $50,000, to manufacture envelopes and kindred paper products. The incorporators are M. Rosner, S. M. Orgler and F. G. Loeffler. The company is represented by Abraham Wielar, 261 Broadway, New York.

Waltham, Mass.—The Waltham Waste Paper Stock Co., has been incorporated with a capital of $5,000, to deal in paper stock. Jacob Cron is president, and Nathan I. Schreibman, 17 Linden street, Waltham, treasurer.

Chicago, Ill.—The Columbian Products Corporation, 320 East Twenty-first street, has been incorporated with a capital of $50,000, to manufacture wall paper and kindred products. The incorporators are Joseph L. Strauss, Adolf Schmidt and Herman Schultz.

West Hoboken, N. J.—The Consumers Paper & Supply Co., has been incorporated with a capital of $10,000, to manufacture and deal in paper products. The incorporators are I. Schwartz and Abraham Winokur, 274 Paterson avenue, West Hoboken. The last noted is representative.

Financial

Greensboro, N. C.—The General Paper Co., has arranged for an increase in capital from $25,000 to $50,000, for expansion.

Rising Sun, Md.—The Durham Pulp & Paper Co., of New Jersey, has curtailed operations at its local mill, due it is stated, to recent financial controversy regarding receivership. The plant is expected to close for the time being.

Toronto, Ont.—Gordon W. Scott, Montreal, Que., has been appointed provisional receiver for the Riordon Co., and the Riordon Pulp & Paper Co., the parent organization. The company's recent proposal to creditors for reorganization was not considered favorably.

Business Opportunities

The Foreign Trade bureau of the Chamber of Commerce, Philadelphia, Pa., has received an inquiry from a company at Valparaiso, Chile, in the market for paper, cardboard and kindred products. Full information available on request.

The Bureau of Foreign and Domestic Commerce, Washington, D. C., has information regarding a company at Agra City, India, in the market for white, unglazed printing paper, and bank M. F. colored tissue. Reference No. 8310.

The Pacific highway is having a south road built into Oregon City at a cost of $183,000 to replace the old wooden road running along the bank of the river. For this work the Crown Willamette Paper company contributed $10,000, and the Hawley Pulp and Paper company have promised $30,000. When this new road is completed the motorists will obtain a splendid view of the Willamette Falls at Oregon City. A picture of these falls is engraved on the service pins given to the employes of the Crown Willamette Paper company who have served it faithfully for a certain number of years.

Paper and Board

New York, December 11.—Generally speaking, conditions in the paper industry remain about the same as last reported. In some kinds of paper, demand is on the increase; this, however, is rather the exception than the rule, and there has been a slowing down of the movement of other descriptions of paper into consuming channels. Business in the aggregate is fair, probably when all kinds of paper are considered, there is broader activity than the trade usually experiences at just this period of the year. However, the weakness in certain papers takes away from the market stability, and is creative of a situation over which many in the industry express dissatisfaction.

A rather sharp decline in wrapping paper prices has been recorded. Partly due to competition by imported paper, and partly to the limited amount of business obtainable by domestic manufacturers, leading producers of kraft wrapping have reduced quotations more than half a cent per pound on No. 1 domestic kraft, and about the same on the No. 2 grade. Most domestic mills are readily taking orders for No. 1 kraft wrapping at 6.25 cents a pound at the mill, and there have been sales reported at less than this figure. No. 2 domestic kraft has sold at 5.25 cents f.o.b. mills, while about the best quality of imported kraft wrapping is quoted at 6.25 cents in New York, which means, of course, that domestic paper is priced at approximately the difference of freight from mills to consuming points above the imported product.

A sharp drop in prices of bogus wrapping also has been noted. The reason for this, it is asserted, is that the cost of raw material has so appreciably decreased that manufacturers were enabled to reduce quotations on the finished product, and bogus wrapping is selling down to 2 cents per pound f.o.b. mills, or at about 2.25 cents New York, representing a decline of one cent a pound from the levels prevailing not a long while ago. Bogus wrapping is made of old waste paper, and since prices of this commodity recently scored a sharp drop manufacturers of bogus wrapping are purchasing their raw material at substantially lower rates and consequently are passing on the saving to consumers by reducing prices of the finished product.

Book paper mills are reported operating on a fair scale. Few have enough business on file to justify maximum production; at the same time, the movement of supplies into consuming channels is of sufficient volume to keep a majority of mills running at a good rate of capacity. Manufacturers are keen for business and are not permitting the matter of a little lower price to stand in the way of them securing orders, which means in other words that some shading of quoted prices is being resorted to. An average of quotations on machine finished book paper of the usual run of quality is about 6.75 cents per pound f.o.b. New York. Sales down to 6.25 cents New York have been reported, but the paper involved in such cases is said not to have been of strictly No. 1 grade. Coated book paper is quoted at 8 cents a pound upward, depending on quality and tonnage, f.o.b. New York.

There is a strong demand for newsprint. Consumption of print paper is holding up at a high level, possibly consumption at the moment is at the zenith for the year, since publishers are printing issues of record-breaking size to carry all of the pre-holiday advertisements of department stores and other merchants. By way of example, one of the afternoon New York dailies put out an issue of 70 pages last Friday, which doubtless comes near to establishing a new record in this city. Newsprint mills are working at top speed and are shipping out their product as rapidly as it comes from machines. Moreover, there is a steady call in the open market for additional supplies of print paper, publishers in frequent

cases finding it necessary to augment their contract commitments by purchases in the open market.

Box boards are moving in a little larger volume and prices appear to have steadied. Eastern mills quote $45 per ton f.o.b. New York for chip board, and $50 New York for news board, with some talk of price shading heard though with manufacturers generally maintaining quotations rather firmly on the surface of the market.

Mechanical Pulp

Activity of fair scope is reported in mechanical pulp and prices are ruling steady. Domestic producers quote around $40 per ton f.o.b. pulp mills for groundwood for prompt shipment, and in some cases a little higher than this is paid, though in instances where a high freight rate must be paid by buyers, lower prices than $40 at grinding plants have been named. Some offerings of groundwood imported from Scandinavian sources are reported at prices ranging in the vicinity of $38 per ton ex dock New York. One of the strong market factors is that consumption of groundwood is large at present, and producers therefore haven't much supply to divert to the open market, with the result very little pressure is exerted by sellers.

Foreign and Domestic Mechanical Pulp

Everything would seem to point to the decline in chemical pulps having been at last checked. At any rate, there is a better tone in the market, and reports say that paper and board maufacturers are evincing increased buying interest, thus leading to a livelier market condition. Importers and producers consequently are firmer in their attitude and are not so ready to discount prices as they were recently to effect sales, and the opinion is openly expressed that prices have touched bottom and that any changes in the immediate future will be in a higher direction.

Foreign unbleached sulphite of No. 1 quality is selling at around 2.75 cents per pound ex dock New York, with some sales slightly below this figure reported. Foreign bleached sulphite is quoted at 4 to 4.25 cents for No. 1 grade ex dock New York, and at about 3.65 cents for the No. 2 quality.

Domestic Rags

Increasing strength in the low grades features the papermaking rag market. Roofing stock has firmed up in price to a pronounced degree until sales of No. 1 packing at 1.70 cents a pound f.o.b. New York and of No. 2 grade at 1.40 cents have been recorded. Packers assert that this class of rags is hard to locate in normal volume, and they are holding out for full quoted prices. New cuttings of some kinds are on the uptrend, due to the fact, it would seem, that paper mills are centering their buying on certain grades, thus making a run of demand for some cuttings while others are neglected. No. 1 white shirt cuttings are quoted at 13 cents per pound f.o.b. New York, unbleached muslins at 11.50 cents, blue overall cuttings at 8.50 cents, and washables at 5.50 cents. Old white rags are quotably steady and are in fair demand. Thirds and blues are moving freely at maintained prices. F.o.b. New York quotations follow:

Old Paper

The trend of waste paper prices is upward, following the period of depression which ended a few days ago and during which values sunk to very low levels. It would seem as if the turn in the market was caused more by conditions at the supply end than at the consuming end, since mills did not enlarge their buying to any great extent. The low prices prevailing, however, resulted in curtailment of collections, and packers, having less stock to dispose of, were able to hold out for better figures. Old folded newspapers are now selling at 85 to 90 cents a hundred pounds f.o.b. New York, and No. 1 mixed papers at 60 to 65 cents New York. Old magazines have advanced to where New York dealers ask 1.65 cents at least, with most of them quoting 1.75 cents f.o.b. New York for flat magazines. Shavings are steady and inclining to rise. A strong item is white blank news, which has risen to 2.20 to 2.30 cents a pound f.o.b. New York. Quotations f.o.b. this city are:

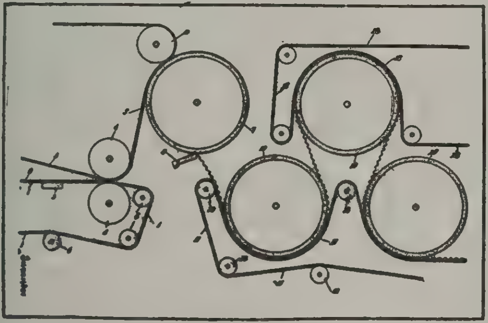
Improved Process of Creping Paper

The Best and Most Profitable

For the manufacture of CREPED PAPER Napkins, Toweling or Stretchable Bag Papers and Creped Packing or Crepe Wrapping Papers the system has no equal



The crepe being formed while the fibres are steaming hot and pliable is dried without stretching; not only retaining form better, but shedding less lint than cold creped paper products.

ORR FELTS and JACKETS

Lowest Cost per Ton

If you judge felt values, not by what you put into the equipment, but what you get out of it—then you will specify ORR 3 stripe Endless Felts for ORR felts will produce the lowest cost per ton. They "stand up" under severe usage. Orr durability is acknowledged everywhere. Their strength and long life are as dependable as their reliability and quality.

In the 32 grades of Felts and Jackets we can match your most exacting demands. Tell us the kind of paper you desire to make, and we will send you samples of felts that will economically serve you and help you to produce paper at lowest cost per ton.

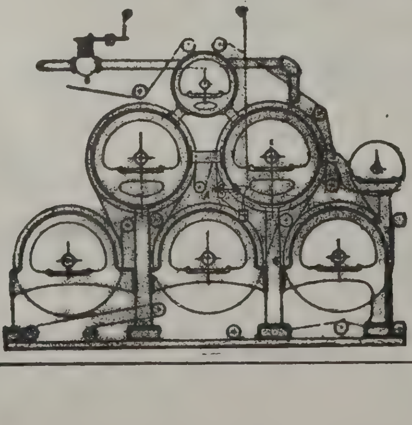
THE PICKLES DRYING REGULATOR



Reasons why you should have it on your machine are: First, it regulates the drying of paper automatically, irregularities are eliminated; second, higher machine finished papers are attainable, because it is possible to maintain the proper quantity of moisture in sheet, as it passes to calenders; third, mills having tried it on one machine have ordered it for all their machines. Vol. XXXIII DECEMBER 20, 1923 No. 9

Symbolism of Paper Markings

Watermarks that Are Now Used as Trademarks Were Formerly Designed to Convey a Message and Had an Esoteric Significance

By DARD HUNTER
Chillicothe, Ohio

Italian Papermakers First to Use Watermarks

WHILE it is possible to determine almost the exact date at which watermarks were first introduced into sheets of paper, the motive or use of these mystic symbols has never been definitely established. Watermarks at the present time are trademarks of the papermakers, pure and simple, but it would seem that their ancient significance must always remain more or less obscure.

Italian Papermakers First to Use Watermarks

The first papermarks appeared in Italy about the year 1280 and while most insignificant in design the emblems lead us to believe that they were meant for use as some sort of a signal or symbol to convey a meaning among the workers who made the watermarks or those who used the paper in which they appeared. Paper was fabricated centuries before this date by the Chinese and Persians but watermarks are never found in any of the ancient Oriental papers.

The earliest moulds upon which sheets of paper were formed were constructed of bamboo or some other vegetable filament and this material did not lend itself any too well for making the applied designs for forming watermarks. However, it would appear that iron wire was used as a mould covering in Europe as early as the eleventh century, when papermaking was introduced into Spain, but papermarks did not make their appearance until about two centuries later when hundreds of different emblems were brought into use by every papermaking country in Europe. These designs multiplied in numbers as the centuries passed until there were literally thousands of different emblems used as watermarks typifying almost everything in nature and every human endeavor.

Present-day workers in the paper industry may well be proud of the history and traditions of their trade for no other craft can show such an endless array of designs extending over a period of more than 700 years!

When printing from movable types was first introduced about the year 1450, the art of watermarking was an accomplishment almost two centuries old. But when we think of the occurrences of printing and watermarking in nature from the beginning of time it seems strange that man did not put to use these arts of impression much earlier. For did not animals, no matter how remote, leave impressions or stamps of their feet in the sands and vegetation impress itself in the clay? These accomplishments of nature were really very closely akin to the arts of watermarking and printing.

Old Books Often Treasure Troves of Watermarks

In examining old books a great profusion of watermarks is noticeable in single volumes. Some fifteenth century works contain no less than fifty papermarks in a single book. Many writers contend that it was necessary for the early printers to purchase their paper from various mills in order to get sufficient material for their use, claiming that the mills were small and could not furnish enough paper which was uniform in size and watermark. While this might have been essential in the fifteenth century it would not seem necessary in the sixteenth, for it is recorded that John Spilman, who operated a paper mill in England in 1588, employed as many as 600 workers and England, at that time, was not a great papermaking country. There is not a mill in all England today making handmade paper in which so many employes are needed and the methods of working do not differ greatly from those of several centuries ago. However, great varieties of papermarks are found in single books that were printed in the sixteenth as well as the fifteenth century.

Use of Particular Emblems

Again, it is suggested that the different watermarks denoted various sizes of paper. This does not seem reasonable, as for every size of paper a special pair of moulds was needed and the labor and expense of fashioning these moulds was too great to permit such a vast variety of dimensions. In later years, to be sure, such marks as foolscap, hand, post, pott, etc., did denote sizes of paper but these appellations were not used as size names until many years after the establishment of these particular emblems as watermarks. Also there were many mills using the same designs on different sizes of sheets so it could not have been that papermarks either represented trademarks of separate mills or denoted special dimensions of sheets of paper. So we are led to wonder just why watermarks were used during the Middle Ages and the only writer who has ventured an explanation as to their symbolic use is Harold Bayley, of London, who a number of years ago wrote one or two magazine articles on the emblematic importance of watermarks. These articles were followed by two most comprehensive books on the subject which should be in every library attempting to cover any phase of papermaking. *

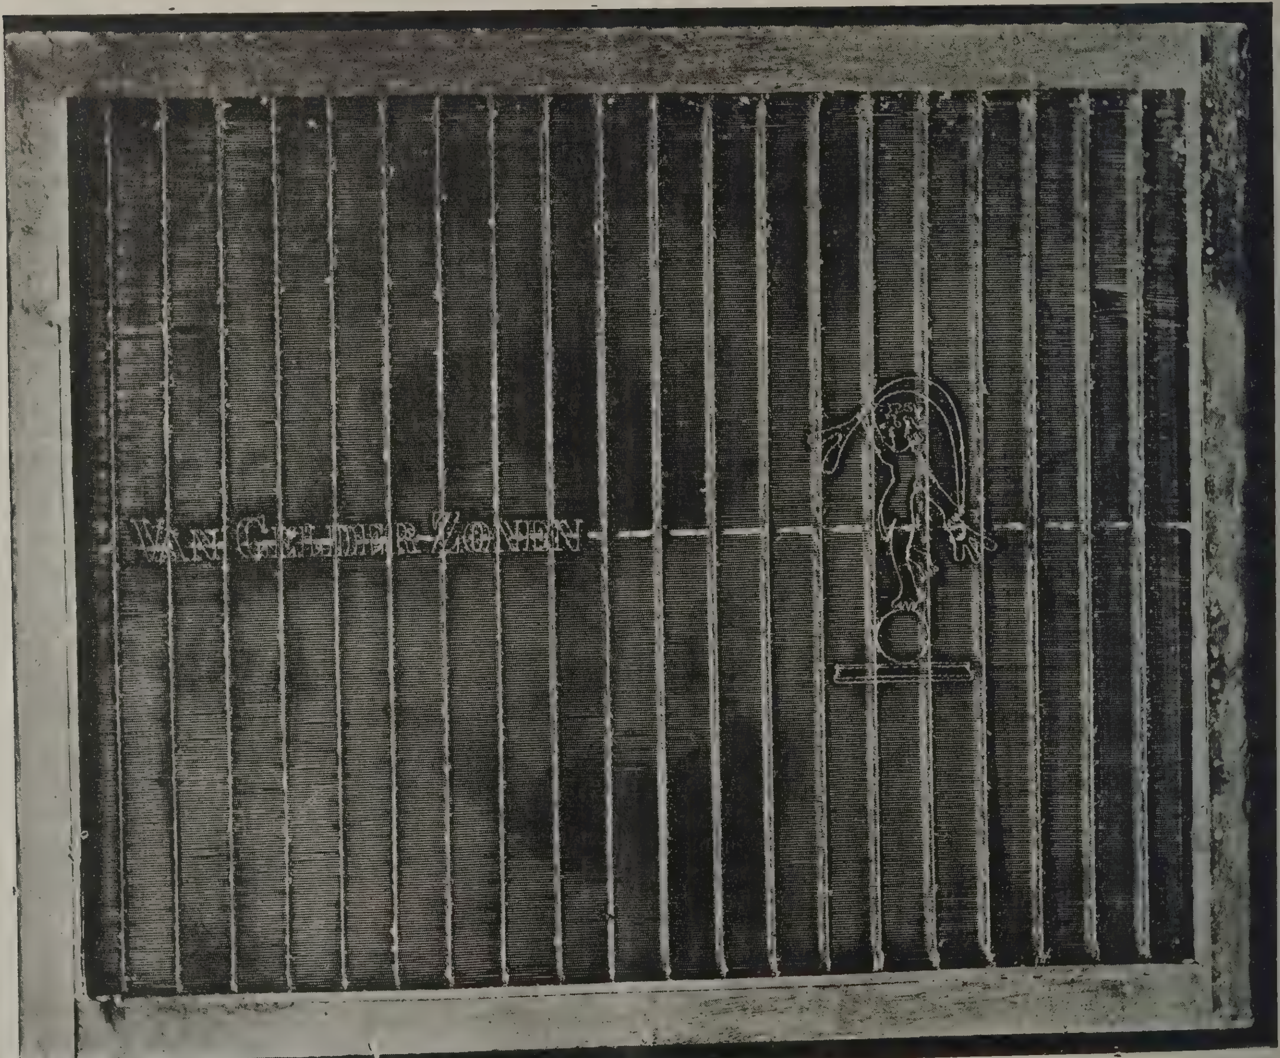
Religious Symbols as Watermarks

According to Mr. Bayley the watermarks of the Middle Ages were employed as symbols of religious propaganda by the heretical papermakers. Europe at that time was overrun with numerous mystic and puritanical sects and the art of papermaking ws one of the most developed trades of these religious orders.

Mr. Bayley says; " . . . . . the arly papermaking districts were precisely those that were strongholds of the heretical sects known as the Albigenses. The word 'Albigenses' is a term applied loosely to the variou pre-Reformation reformers whose strongholds stretched from Northern Spain across the southern provinces of France to Lombardy and Tuscany. In Spain and France they were known as Albigenses from Albi the name of one of the prominent towns. In the Alpine provinces they were called Waldenses, from Peter Waldo, one of their most conspicuous members. In Italy, history alludes to them under the terms Cathari or Patarini." Mr. Bayley attaches symbolic importance to each of the watermarks that were used by these mystic people and believes that the papermarks carried with them signals of hidden meaning. This really seems more probable than to try to account for the multitude of watermarked designs as marks of identification for paper sizes or as trademarks of the makers.

Symbolic Significance of Ancient Watermarks

While it will not be possible to enter into the symbolic significance of the many thousands of different papermarks



Antique-laid mould with the deckle in place. This mould shows the wire watermark of the human figure, an emblem much in evidence during the entire history of symbolism. This mould was used in the "Eendragt" paper mill in the village of Wormer, Holland, about the year 1785

Bayley, Harold. Notes on Watermarks. In: *The Book-Lover's Magazine,* 4to., vol. VI.—part II., pp. 65-71. Edinburgh, 1906.

Bayley, Harold. *The Lost Language of Symbolism.* An inquiry into the origin of certain letters, words, names, etc. 2 vols., 8vo., vol. 1—pp. 375; vol. 2—pp. 388, London, 1912.

it will not be out of place to relate the meaning of several of the best known of these ancient symbols. The first papermarks which appeared during the latter thirteenth century were entirely simple in form and consisted of crosses, ovals, Soloman's knots, circles, triangles, three-mounts with cross designs as well as other unpretentious forms of a kind easily twisted into wire. All of these simple designs had their religious meaning which is obvious.

Later came into use such marks as parts of the human body and real and legendary animals, also every form of vegetation and the appliances used by man in the cultivation of the ground and working at the various crafts. However, in the examination of thousands of old papermarks a form or device representing any phase of the art of papermaking has never been noted.

Bull's Head and Other Early Marks

One of the earliest animal marks is that of a bull or bull's head, embellished with additional symbols such as the cross and serpent as shown in Fig. 1.

It is interesting to note that this particular mark was traced from the Myles Coverdale translation of the Bible which was printed in 1536—the first Bible to be printed in the English language. The ox was emblematic of patience and strength and in the writings of some of the early Fathers it is accepted as a symbol of Christ the true sacrifice; also of prophets, apostles, and saints slain for the sake of Christ and all who patiently bear the yoke and labor in silence for the good of others.

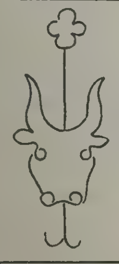

Fig. 1

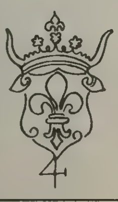

Fig. 2

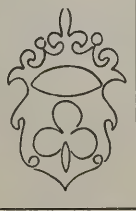

Fig. 3

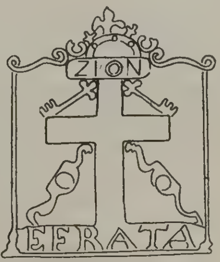

Fig. 4

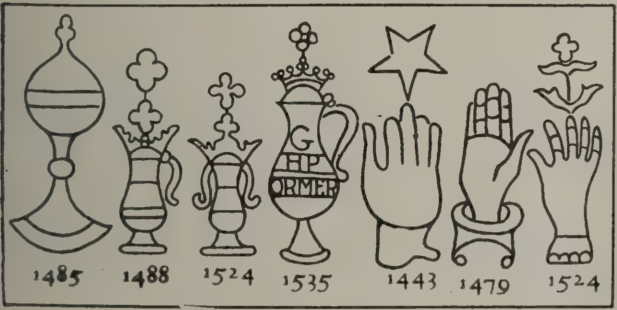
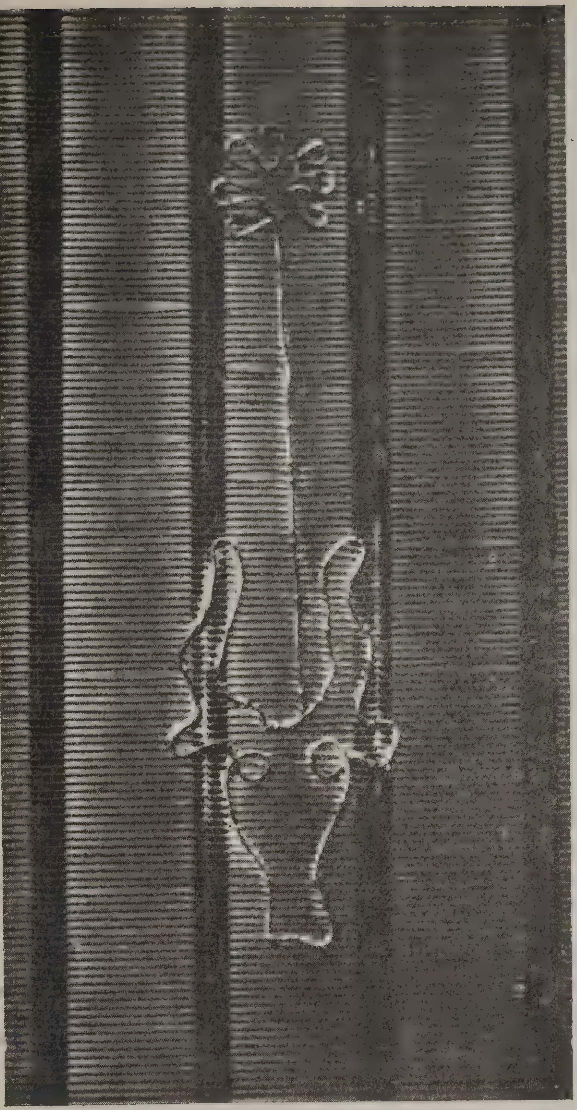
The bull's head as a watermark is found as early as 1310 and was used until the beginning of the sixteenth century, evolving gradually into a shield-like scroll with horns at the top on either side, such as shown in Fig. 2. It is thought that the mark adopted by William Rittenhouse, the first papermaker in America, (A. D. 1690) was an outgrowth of the early papermark of the bull's head. Fig. 3.

The watermark known as "pott" originally represented a sacramental vessel and dates from about 1350. This mark was in subsequent ages adorned and embellished almost beyond recognition. The sacred character of the pott mark may be seen in paper as late as the latter seventeenth century when some of these marks bear the ecclesiastical inscription I. H. S.



Watermarks of "pott" and "hand"



The actual wire form on the surface of a laid mould which caused the impression or watermark in the sheets of paper made thereon. An ancient "bull" device from about 1400

The mark of the human hand was used by the papermakers of various countries for hundreds of years and was both symbolic of Fidelity and Labor. At times the hand shows two fingers bent downward which was a sign of benediction. The hand watermark is also found in old paper surmounted by a cross, a star, a rose of bliss, or some like ornament each of which was symbolic of something of an ecclesiastical nature; the size of paper known in later years as "hand" derived its name from this emblem rather than this appellation having been given to a particular size of paper.

It would be possible to relate the symbolic meaning and importance of practically all of the old watermarks but this would involve the descriptions of thousands of emblems as no less than fifteen thousand different designs have been traced in the papers of the first five centuries of watermarking.

Mystic Watermark of a Religious Sect

Watermarks of a symbolic and religious meaning held their place with the first papermakers of America, some of which were in use until the middle of the eighteenth century. The most emblematic of these were the marks adopted by the paper mill established by the Zionistic Brotherhood, a religious colony which was founded near Ephrata, Pennsylvania, in

1736. Their principal watermark, Fig. 4, consisted of a Latin cross surmounted by a scroll which was embraced by two keys which had reference to the "Clavicula Salomonis," or Keys of Soloman, a mystic book of the seventeenth century which was highly regarded by the brotherhood. The top portion of this watermark was no doubt an outgrowth of the ancient bull's head design illustrated in the other marks.

From the commencement of watermarking in Italy in 1280 to the eighteenth century in the New World, when watermarks in all countries began to lose their symbolic reference, we have an unbroken chain of emblems each of which signified a mystic meaning of some religious sect or belief.

Rapid Analysis of Paper

French Technologist Explains Method for Quickly Determining Constituents of a Paper Sample for Purposes of Duplication

By Jacques Crolard

(Continued from last week)

THE lignin number of index is the percentage of lignin that is contained in a pulp or paper.

The determination of this number is of great importance. It gives an idea of the thoroughness of the digestion process, which has for its purpose the removal of the incrustating materials that cover the cellulosic fiber of the paper stock. This affords the analyst a conclusion regarding the availability of a certain pulp for use in the manufacture of a definite grade of paper.

The percentage of cellulose in a pulp depends on the nature of the hydrolytic digestion to which the original raw material has been subjected. In general, the ligno-celluloses which are used in the manufacture of paper are composed of a group of cellulosic materials known as oxycellulose, and alpha and beta cellulose, mixed with a greater or lesser proportion of lignin. If the hydrolytic digestion and the bleaching process are carried out with a maximum degree of intensity the percentage of lignin left in the pulp should be infinitely small according to theory.

In practice the percentage of lignin is generally constant for any grade of pulp. This fact is of the utmost importance in the analytical determination of the percentage of lignin in a paper through the establishment of the lignin index. Numerous methods have been proposed for this purpose, but only one is described below, as it gives very accurate results and is satisfactory from all standpoints.

This method is based on the principle that the absorption of phenol by a cellulose, either pulp or paper, is a function of the percentage of lignin which is combined with that cellulose.

The lignin number can therefore be obtained by multiplying the percentage of phenol that is absorbed by the paper by a certain coefficient. In what follows the percentage of phenol absorbed is understood to be the lignin index.

Details of the Method

The first piece of information it is necessary to know is the proportion of phenol that is absorbed by different kinds of cellulose. This is found by making a series of experiments in which conditions are maintained as constant as possible. In each case the excess of phenol which is not absorbed is determined by titration with a standard solution of furfurol. The method of procedure is explained in the former articles on this subject. The phenol absorption coefficient of the paper can be determined in this manner. The composition of this paper can be told by a qualitative analysis.

The phenol absorption table which is given in a former article of this series is employed in these calculations.

The quantity of phenol that is absorbed by the paper, which qualitative analysis has shown to be composed of rag stock and jute, is found to be 1.5 percent. The phloroglucin numbers for rag stock and jute are 0.5 and 4.1 respectively. Therefore the proportion of jute in the paper will be as follows:

$J=100(1.5 - 0.5)$ divided by $4.1 - 0.5$ or 27.7 percent.

Suppose the qualitative analysis of the paper indicated that it was composed of rag stock in which a certain proportion of bleached soda pulp had been mixed. The phenol coefficient is 0.6 percent. The percentage of chemical pulp in the paper is then found by solving the following equation:

$B=100(0.6 - 0.5)$ divided by $1.2 - 0.5$ or 14.2 percent.

Application of the Various Methods

The microscopic analysis require a considerable degree of skill on the part of the operator. When the pulp is very thoroughly beaten it becomes a very difficult matter to make an accurate microscopical examination. It is always possible to use the microscope for this purpose but the results obtained vary in accuracy.

The chemical determinations require only ordinary skill on the part of the paper chemist and just a working knowledge of the mechanism of the reactions that are employed. The work is no more difficult than the ordinary analytical operations that are carried out in inorganic analysis. But unfortunately the analytical results are only applicable when the characteristic indices of the different fibers are sufficiently well-defined, so that the experimental error does not introduce too great discrepancies in the mathematic calculations.

Hence, in the case where the paper is composed of rag stock and bleached chemical wod pulp, the lignin index determination will give results of rather uncertain accuracy, while when the analysis is made so that the furfuraldehyde number of the paper is determined, the proportions of the two kinds of stock in the paper are determined with a sufficient degree of accuracy.

Hence as a general rule it is good practice, wherever it is possible, to analyze the paper in a number of ways rather than by just one method. In this manner the results are better controlled and can be compared with one another so that an average of the different values can be arrived at. When the analytical examination is carried out in a regular series or logical order, as is the common practice in the modern, well-organized and well-conducted paper laboratory, the different operations that have to be performed follow one another very rapidly and the various determinations are made under conditions which afford attainment of the highest degree of accuracy.

In order that the reader may have an idea as to how the various analytical methods which have been discussed up to this point, can be applied, two examples are given below.

Analysis of Composite Paper

The first paper that is taken as an example to illustrate the application of these methods is a complex paper which is composed of bleached sulphite pulp, esparto pulp and mechanical wood pulp.

The furfuraldehyde numbers of these various grades of pulp are as follows:

Bleached bisulphite pulp	4 percent
Esparto pulp	13 percent
Mechanical wood pulp	6 percent

The lignin indices of the same substances, that is the percent of phenol absorbed by them, are given in the following tabulation:

Bleached bisulphite pulp	0.8 percent
Esparto pulp	0.7 percent
Mechanical wood pulp	8 percent

To make a microscopic examination of a paper composed of the three aforementioned classes of fibers, is a very difficult matter owing to the fact that there is quite a big difference between the dimensions of these fibers. Rather than spend considerable time in carrying out a laborious misroscopical examination, it is far more advisable in this case to make a chemical analysis of the paper.

Before making any chemical tests it is well to examine the tabulations of indices which are given above. It is easy to see from the tabulation of lignin indices of the three classes of paper stock that it would be inadvisable to use this factor in analyzing the paper because the lignin index of esparto pulp is so close to that of bleached sulphite pulp that it would be a very difficult if not impossible proposition to obtain accurate results by such an examination. There is not enough leeway between these values to take care of the experimental error in determining the lignin index of the paper.

On the other hand, there is quite a wide separation between the furfuraldehyde numbers of these three pulps and this method can be used in determining the percentages of esparto and bleached sulphite pulp in the paper. The percentage of mechanical wood pulp in the paper is independently determined by means of the lignin number.

Hence both the lignin number and the furfuraldehyde number of the paper are found. The lignin number proves to be 2.0 percent. If M is the percentage of mechanical wood pulp, then by solving the following equation the percentage of M can be found:

M=100(2 — 0.8) divided by 8. — 0.8, or approximately 17 percent.

The furfuraldehyde number of the paper is found to be 8.0 percent. Then from the following equations, in which A is the proportion of esparto pulp in the paper and B the percentage of bleached sulphite pulp, it is possible to find the proportions of these two fibers in the paper:

$$A+B+17=100$$

$$13\,A/100+4\,B/100+17\text{x}6/100=8$$

The solution of these two simultaneous equations gives 41 percent for esparto pulp and 42 percent for sulphite pulp. The three results, 17 percent for mechanical pulp, 41 percent for esparto pulp and 42 percent for bleached chemical pulp add up to 100 percent.

Analysis of a Jute Paper

When jute stock is well bleached and used in the manufacture of paper in admixture with other kinds of pulps it becomes a very difficult matter to distinguish the jute fiber from the other fibers under the microscope. Under certain conditions it is possible for it to escape detection by the analyst altogether, which is particularly true when the pulp has been well beaten and considerably hydrolyzed. Under these conditions the determination of the percentage of phenol absorbed by the paper is extremely instructive.

A cigarette paper was taken as a sample and analyzed in this manner. This paper was supposed to have been from manufactured rag stock only. It gave a lignin number of 1.1. If the lignin number of rag stock and of mechanical wood pulp is taken to be 0.6 in both cases, then the percentage of jute in the paper can be determined from the following equation:

J=100(1.1 — 0.6) divided by 4.1 — 0.6=14 per cent.

(The continuation of this interesting series will appear in an early issue.

Alcohol from Sulphite Lyes

Profit and Loss in Operations for the Recovery of By-Products from Waste Liquors of the Sulphite and Soda Mills Interestingly Discussed

By Martin L. Griffin

Member of the Soda Pulp Committee of T. A. P. P. I.

I HAVE carefully reviewed Prof. Ralph H. McKee's paper read before the American Section of the Societe de Chimie Industrielle on October 12 and reproduced in the issue of Paper for November 7. In this article he computes a yearly profit and saving of $125,287 from the recovery of alcohol and fuel value, on an investment of $440,000 in connection with a sulphite pulp mill of 100 tons daily capacity. This net profit is at a rate of over 25 per cent on the investment, and the question naturally arises, Why have not manufacturers grasped this opportunity for profit? The plan outlined by Professor McKee contains no new matter, with one slight exception, and nothing new in the processing.

There are many reasons, first in importance being that waste liquors are produced on an enormous scale, varying in quality according to the ideas of the particular mill and often varying widely in the same plant.

High Concentration of Liquor Necessary

So far as the development of fermentable sugars in the cooking process is concerned, it is a delicate and sensitive process involving much uncertainty. The making of pulp and the recovery of alcohol must be co-operative to a nicety. The results obtained by Professor McKee show a wide variation in the possible alcohol recovery. The waste liquors must be handled with a view to keeping up the concentration as far as possible. This of itself is a hardship to the pulp mill which usually wants to begin washing the pulp with water as soon as the pulp is blown, and often water is showered into the venting towers of the blow tanks during the blowing.

For the benefit of the alcohol process the liquor should drain or be expressed at full digester strength. To do this, the capacity of the department would have to be increased. It is fair to say that such an expense would apply to any contemplated process for the recovery of useful products involving evaporation. It is a matter which must be reckoned with, if anything like complete disposition of the liquor is contemplated.

The basic part of the whole proposal is one of evaporation of a very troublesome liquid. It is either acid and corrosive, or alkaline with lime, and in either case, scale-forming. These are two troublesome matters to deal with. It is easy enough to neutralize the liquor and thus avoid the effect of acidity, but there is no way of removing the lime and magnesia scale-forming substances, and no way of avoiding their consequences, except by the substitution of soda as the base in acid making and the cost of this would be prohibitive as matters stand now.

Professor McKee suggests by preference a thermo-compressor type of evaporator for reducing the original volume of the waste liquor one half, and completing the evaporation of the residual liquor after fermentation in a triple effect vacuum pan.

A comprehensive discussion of evaporators is a large and important subject in itself. The thermo-compressor is a most interesting type, and affords many excellent problems for the technical student to work out, but is of such questionable value that our builders of evaporating equipment have never brought it to public notice. One of its principal handicaps is, that it is not capable of operating at high temperature drops. Therefore it is not adapted to high concentrations, and will necessitate much large heating surfaces to do the same amount of work. The equipment will therefore be more costly.

Thermo-compressors require power directly from prime movers, either high pressure steam, if the nozzle type is to be used, or mechanical power if a turbo-compressor is considered; while the multiple vacuum pan is well suited to use exhaust steam from a prime mover and, in connection with a high vacuum, obtains a high temperature drop in a triple effect.

An Important Detail Ignored

Two types of evaporators in the same plant would not tend to simplicity of operation. Besides, I take it, a third stage in the process of water disposal must be reckoned with to bring the residue to a suitable stage for burning after leaving the triple evaporator. Professor McKee makes no reference to this. The heavy liquor will contain about 45 percent of water and will have no inclination to burn. Sulphite liquor residues, even when dry, will not burn as readily as the soda pulp liquors under the same conditions.

Another step in the process as outlined appears to be very simple and practical—namely: "The hot waste sulphite liquor draining off from the woodpulp in the digester blow-pit is run into a de-sulphurizing column about 16 feet high where it meets a counter current of steam and has the larger part of its sulphur dioxide removed."

The amount of free sulphur gas in the liquor at the time of blowing off varies greatly according to the use to which the pulp is to be put, but in any case, most of it is very effectively steam stripped in the act of blowing and is usually lost. It is sometimes recovered by venting through a condenser, allowing the gas to pass on into the acidmaking system. It is, however, not customary to do this. I seriously doubt if the sulphur dioxide recovered from the drainage liquor by counter current treatment in a tower with steam would be effective or profitable; if effective it would be costly in the consumption of steam which would further dilute the liquor.

Market for Alcohol Very Uncertain

Regarding the production and recovery of alcohol we must concede that to obtain a possible 1 percent from such a waste liquor is not an alluring proposition financially. It goes without saying that the control of fermentation processes is highly technical and exacting, and requires special knowledge and experience. The government regulations relating to the manufacture of alcohol impose many annoyances and the business must be viewed from a very different angle from what it formerly was. The market for alcohol would be extremely uncertain.

Such have been the experiences of the company referred to in this country which spared neither money nor talent to recover alcohol from its waste sulphite liquor on a commercial scale and the proposition has long since been abandoned.

It is claimed that new and important discoveries in the fermentation process applicable to sulphite waste liquors have been made in the laboratories of Columbia University. The statement is made that the normal acidity of the liquor after the removal of the free sulphur dioxide is not poisonous to the yeast ferment, and if air is bubbled through the liquid during the fermentation process, the yeast, properly fed, will thrive.

I do not doubt that the bubbling of air would be beneficial, but the conclusions would carry more weight if they were supported by further evidence. Pasteur showed many years ago that yeast spores would live and do considerable work under an unfavorable environment, but soon became sickly unless they were adequately supplied with a source of oxygen.

It is common knowledge that fish life has been completely destroyed in waters badly polluted with sulphite waste. One reason is the lack of atmospheric oxygen, which lack is very persistent in streams so polluted. I am personally acquainted with a case where a sulphite mill discharged its waste into a river and throughout its course for over 100 miles it had not recovered its normal volume of air or thrown off its polluting burden. Tributaries of the same river upon which tanneries were located discharging their waste into their waters disposed of their burden and returned to normality within a comparatively short distance.

Sulphite waste is an enormous consumer of oxygen and it is very questionable whether the bubbling of air through it would adequately furnish oxygen to sustain a healthy activity of the ferment.

Fuel Value of Residue

Regarding the second phase of the process in which a fuel value of at least $65,372 is worked out, we may get an off-hand check on this by taking a look at the process of recovery of black ash by the soda process.

Regarding the second phase of the process in which a fuel value of at least $65,372 is worked out, we may get an off-hand check on this by taking a look at the process of recovery of black ash by the soda process.
The black liquor by this process is evaporated to a consistency of about 60 percent solids and 40 percent water and is fed into the rear end of a revolving furnace, 16 to 20 feet in length. A steam boiler is set in connection with the rear end of this revolving furnace to absorb the heat of combustion of the organic matter. There is also a traverse coal burning furnace in front of the rotary to insure heat at all times to keep it working properly.

It is well known that steam enough to supply the vacuum pans cannot be depended upon from the burning liquor even with the burning of considerable coal in the traverse furnace.

If therefore it is possible to realize a considerable fuel value from the dregs of the fermentation process, certainly a much greater saving should result from the black ash process, and if this is true, the present practice is faulty and should be corrected.

A few years ago at an annual dinner of the Technical Association we had the pleasure of listening to an address of the late Charles P. Steinmetz bearing on this subject. His argument was in substance as follows: It is conceded that our coal deposits are of organic origin in pre-historic times. If we distil bituminous coal we get valuable products. Therefore, may we not expect to get valuable intermediates from a destructive distillation of the wood waste residues in the manufacture of wood pulp?

The destructive distillation of hard woods for methanol and acetic acid is still continued in a relatively crude way, comparable with the beehive coke oven practice. Every cord of hard wood which is so distilled represents a loss of over 1,000 pounds of chemical pulp, which is rather less than half the weight of solid matter per cord. Considering that the distillation products are derived from the intercellular matter, the only offset for the loss of this pulp fiber is about 25 percent of the woody substance in charcoal, a product of very inferior value as compared with paper stock.

The logical conclusion therefore is, the discovery and development of processes for the recovery of wood distillation products from pulp mill by-product liquors, which carry essentially those constituents of the wood from which valuable derivatives come.

This has been the problem for many years and many unsuccessful attempts have been made to solve it. The solution can only come through adequate research of a practical nature and a vision of the possibilities to be realized. By the soda process it would require a retorting process in place of the rotary incinerating furnaces and all the appliances for distillation and handling large volumes of combustible gases. Pulp manufacturers would generally look upon such a project as experimental, costly, and tending to lead them far-a-field.

To manufacturers of sulphite pulp the whole process would be new and additional to present practice.

These waste liquors do not contain valuable simple substances which can be separated, and if they did and could be recovered at a profit, the problem of stream pollution would still remain unsolved. I believe some blanket treatment such as I have outlined is the only adequate avenue of approach to a complete solution.

At a later date I will perhaps review the many attempts that have been made dealing with destructive distillation, and what some of the obstacles to a solution of the problem have been.

Steam Turbines in Pulp and Paper Mills

Application of Steam Turbo-Generators in the Manufacture of Pulp and Paper—Discussion of Various Types and Advantages of Each

By A. G. Darling*

Industrial Engineering Dept., General Electric Co.

THE particular phase of interest today is in the application of steam turbo-generators to your mills. Each mill has its own problems varying widely from other mills in many cases while in some the conditions are the same but the results desired differ from each other. What has been done to obtain maximum economy at minimum cost is probably of greater interest as general statements than the review of particular cases. With general principles in mind, specific instances can more readily be solved.

Steam is the most useful form of heat that has been tried in paper mills. Its peculiar characteristics deserve attention—for instance, it takes one heat unit to raise a pound of water 1°F. It takes .3 of a unit to raise a pound of steam from 212°F. to 213°F. at about atmospheric pressure. On the other hand, it takes 972 units at about atmospheric pressure to change water into steam while at 3200 pounds pressure or 706°F. any additional heat changes water into steam. This point is called the critical pressure. Conversely, in changing steam back to water near atmospheric pressure a large amount of heat is made available and is used in a great many processes which require large amounts of heat to complete them. However, if condensation does not take place in the processes but only steam or water gives up its heat, the amount of steam or water must be enormously increased.

On this point drying systems of paper machines prove successful or fail. Condensation can be used in a process but not in a steam engine, therefore, the dividing point in the use of hot water or steam determines the application of the energy released. For certain processes, temperatures higher than that of the boiling point of water are required necessitating the use of an increased pressure, because it is not so much the additional heat that can be released as the penetration caused by the pressure upon the process involved. The example that bears this out is the cooking of chips.

The processes of the paper industry generally require pressures of relatively low order—for example, heatng of buildings, 5 to 10 lbs.; drying, 5 to 20 lbs.; evaporating, 20 to 50 lbs.; cooking, 60 to 120 lbs. The first three, heating, drying and evaporating, are about in one class, that is to say if they were the only pressures to be considered the upper limit would determine the boiler pressure of the mill and the other pressures would probably be obtained by throttling but as they are not the only conditions to be satisfied, steam for evaporation is generally considered separate from the heating of buildings and the drying of paper. When large quantities of steam are involved for the various processes the reasons for separating the sources of pressure become even more distinct.

Steam for cooking is a feature by itself and so far has been obtained almost entirely direct from the boilers or by throttling the boiler pressure. Based on information obtained from various paper chemists, it is understood that a maximum total temperature must not be exceeded and further that high pressures raise the cost of digesters beyond economical limits; therefore, it is quite clear that if cooking steam is obtained direct from the boilers or throttled, the total heat and, therefore, the pressure and temperature of the boiler steam, is immediately determined by the total heat permissible in the digester.

Certain elements enter into the cost of generating steam. They are the cost of equipment such as boilers, grates, steam piping, housing, etc., as initial investments to which must be added insurance, taxes and depreciation and again the cost of maintenance and operation including labor and fuel. Fortunately the cost of steam does not directly depend upon its pressure, that is to say, it is not much more expensive to obtain higher pressures than moderate pressures. For the higher pressures the additional initial investment is only a fraction of the investment for low pressure, therefore, the fixed charges are not materially increased when higher pressures are considered. The item that is directly affected is fuel; and the extra amount used is in direct proportion to the heat of the higher pressure over the lower; labor and maintenance are also somewhat increased.

Steam turbines depend upon the available energy in the steam for their mechanical power. As the pressures increase, more energy is placed in the steam and, therefore, less pounds of steam are required to accomplish the same result. For smaller amounts of steam it can readily be seen that less initial investment and, therefore, lower fixed charges and operating cost follow in order. The limit to which the initial boiler pressure of the paper mill can be taken is determined as before mentioned by digester temperatures. If there were no digesters, however, the limit is again determined by the amount of energy required for process steam and the amount of energy required for mechanical work. The two must bal-

---

**Presented at meeting of Northern New York division, Superintendents association, Carthage, N. Y., November 17, 1923.*

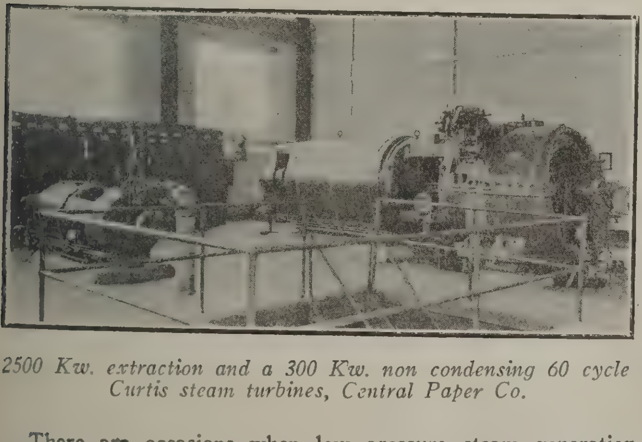
ance each other or mechanical energy must be called in to make up the deficiency. This means additional cost of equipment and added operating expense.

It is not beyond the possibilities of turbine design to utilize the highest pressures that boilers and piping can stand. Turbines can be made to exhaust at temperatures useful in digesters, that is to say, a non-condensing turbine could be placed between boiler pressure and digester pressure. However, to make such a turbine pay, the amount of steam must be large, the rate of flow must be regular, that is, a number of digesters should be in continuous service so obtaining a high steam load factor. The initial pressure must be relatively high, that is in the order of 250 lbs. or more. Very few cases have come to the attention of the author where this source of power can be even thought of because the installations now made have not taken the possibility into consideration.

Methods for Obtaining Low Pressure Steam

Having the upper limit of boiler pressure determined from the digester temperature, or if no digesters are in use from the standpoint of heat economy, the next step is to solve in the most economical manner, the method or methods to be used to take out the available heat between boiler pressure and process pressures.

The amount of steam that is demanded by process and the heat in it determines the size of turbo-generators that can be utilized between boiler pressure and process pressure. There are, of course, variations in the amount of process steam as likewise there are variations in the demands for electrical power and the two do not always coincide. Flexibility must be available and in general it may be said for a completely electrified mill, that is, one which takes its raw materials from the log state through to commercial paper, the power demands are far in excess of that available from the heat contained in the steam used in process between boiler and process pressures, In general, it may be said, however, that it will pay to develop all the available energy that there is in the steam between boiler and process pressure, making up the deficit from other sources such as water power or condensing steam turbines. There are some cases, of course, where this is not true. As we are dealing with general cases rather than particular instances, the previous statement may be used as a general rule. Each case must be settled by itself on the basis of one scheme against the cost of any other scheme.



2500 Kw. extraction and a 300 Kw. non condensing 60 cycle Curtis steam turbines, Central Paper Co.

There are occasions when low pressure steam generation would pay. These are very few and can be attributed generally to a surplus of water power. Electric boilers can here be used to convert the excess electrical energy into steam.

The chief methods, therefore, left for furnishing low pressure steam are:

1—throttling
2—non-condensing turbines
3—extraction turbines
4—combinations of the first three

Going back to throttling, it is interesting to note that there are very few instances when throttling itself would pay. These instances are becoming less as the public becomes acquainted with other methods. The loss of available energy by throttling is the cause of its decreasing use. It is, of course, understood that there is no actual loss of heat in the transfer from high to low pressure.

Whether or not the original designers of paper machines and engines had in mind the balancing of mechanical power with heat obtainable from the exhaust of the driving engine is hard to ascertain but in any event, they came fairly close to getting what was most economical from this standpoint. Turbo-generators with motor drive on the paper machines seem to fulfill the two requirements even better than engines and at the same time give closer speed regulation. Unfortunately some rather loose work is done at times which disturbs this balance and gives an excess of generating capacity or low pressure steam. In some cases where the designers realize that they are not getting a balance they cover it up by putting in turbines of very low economy. A little more thought on the available heat energy required would determine the economical initial pressure. Some cases demand that the turbine be fairly uneconomical because it would cost too much to change other parts of the plant to realize the economy in turbine performance.

3000 Kw. 750 Kw. 60 cycle condensing Curtis steam turbines P. H. Glatfelter Company

Variations in the quantity of steam required with constant electrical demand such as seasonal heating and low pressure cooking in odd cycles tend to limit the use of non-condensing turbines. Steam accumulators have been developed and are in use in some mills which wipe out the variations in steam demand and act as reservoirs to take excess steam when it is not required in the process and to give it up when the electrical demands are low. A great many mills have been successful in economical operation without accumulators because their systems are flexible enough to absorb excess and to furnish demands. The electrical end is usually taken care of by operating the non-condensing turbines in parallel with hydro-electrical units or condensing turbines having the none-condensing turbine designed to give the maximum amount of steam required, filling in the electrical demands from the parallel sources of power, that is to say, the non-condensing turbine floats electrically on the rest of the system furnishing electrical energy in direct proportion to the steam demand.

The latest types of paper machine drives are utilizing direct current for the paper machine motors. Motor generator sets, alternating to direct current, with alternating current as the prime mover, coming in either from steam turbines or water power, supply the power. Relatively cheap prime mover power must be available for this method as the fixed charges and losses of the motor generator set are to be added to the prime power costs to arrive at direct current power costs. The other

The size of the electrical ends are fixed by the paper machine alternative is to utilize non-condensing direct current turbines. drives. The amount of steam available for the turbine is fixed by the drying demands of the paper machine. The adjustable unit between the two is the heat content of the steam at the turbine throttle. As pointed out before, this is governed by other conditions within the mill which are variable within reasonable ranges. Speed regulations of the turbine is obtained by the governor. The paper machine drive, however, demands that the voltage be variable in order to get speed ranges on the paper machine. Voltage regulators can be used to keep the speed of the paper machine constant at predetermined speeds due to the demands of the paper machine for adjustable speed. The DC turbine and motor-generator set are not available for other uses. On the other hand the exhaust steam from the turbine can be alternatively furnished to the paper machine which the turbine is driving or to other paper machines or process. Some mills prefer even to isolate the exhaust of their turbines so that there can be no chance of other demands affecting the supply of steam to the machine in question. Even with an accurate balance between mechanical power and exhaust steam laid out on paper it is not thought advisable to eliminate an alternative source of steam from consideration in most plants. This is done by high pressure make up.

The non-condensing turbine for paper machine drive is not the only one that can be used to advantage in the mills where super-calendars, low pressure cooking and heating of beater water, bleaching, etc., are done. The supply of low pressure steam to these demands is a fine opportunity to obtain electrical power due to the difference in available energy between boiler pressure and process pressure. In this case alternating current generators would generally be used operated in parallel with other sources of the same type of current.

To summarize the non-condensing turbine, it may be said that in general its function is supplementary to other sources of electrical energy but that when so used it is more economical in its use of steam per KW of output than other types of turbines supplying an equal amount of electrical energy and exhaust steam.

Extraction Condensing Turbine

The extraction turbine has an internal grid valve consisting of stationary and a moving annular ring with ports open in each of oblong sections. The blanks on the stationary ring provide means of shutting off the steam from the ports on the moving ring. Through an opening in the turbine casing at the high pressure side the grid valve opens or closes to force out more or less steam, so giving a constant pressure in the extraction line.

With an adjustable diaphragm in the extraction line, various pressures can be held for different quantities of steam demanded. Some steam is always required on the low pressure side of the grid valve which is not wasted but produces mechanical energy while it passes to the condenser. As less steam is passed out of the extraction line, more is required in the low pressure cylinder to carry a given electrical load, therefore, we have the combination in this turbine of a straight condensing turbine and a non-condensing turbine to supply variable steam and electrical demands, the variations in each need not coincide with each other.

For moderate size plants which do not have low cost power from condensing turbines, extraction turbines frequently work out to be less expensive than the combination of condensing turbines with non-condensing turbines. This is especially true where there is a widely fluctuating demand for steam both hourly and seasonal. This can be readily understood if we consider that the non-condensing turbine must be arranged on both turbine and generator ends to correspond to the maximum demand for steam. If this is not done high pressure make up must be used. At the same time the condensing turbine operating in parallel must also be of such size as will carry the maximum electrical load, therefore we duplicate, so far as electrical capacity is concerned, a certain proportion of the required capacity in each generator. On the other hand, the extraction turbine has but one generator and two steam cylinders either one of which or both are capable of meeting both the electrical and steam demands.

To differentiate and determine which scheme should be used, the non-condensing or the extraction turbine, it is necessary to balance up the heat required to perform the various functions in the mill. If these problems are analyzed on a heat unit basis, the various parts will be shown up in their true value allowing a close balancing of the opposing amounts.

Paper Men at Immigration Conference

The following manufacturers of paper were named by Henry W. Stokes of Philadelphia, president of the American Paper and Pulp association, to represent that organization at the National Immigration Conference in New York, December 13-14, under the auspices of the National Industrial Conference board:

P. T. Dodge, International Paper company, New York; C. A. Crocker, Crocker-McElwain company, Holyoke, Mass.; E. R. Behrend, Hammermill Paper company. Erie, Pa.; Hugh J. Chisholm, Oxford Paper company, New York City; Geo. W. Sisson, Jr., Racquette River Paper company, Potsdam, N. Y.; H. A. Moses, Strathmore company, Mittineague, Mass.; Milton E. Marcus, Bedford Pulp and Paper company, Richmond, Va.; Frank L. Stevens, Stevens and Thompson Paper company, North Hoosick, N. Y.; W. F. Brunner, Paterson Parchment Paper company, Passaic, N. J.; and A. D. Coffin, C. H. Dexter and Sons, Inc., Windsor Locks, Conn.

Henry W. Stokes, York Haven Paper company, Philadelphia, Pa., attended as president of the association. Dr. Hugh P. Baker, secretary of the association was asked to serve as a member of a special committee to assist M. W. Alexander, managing director of the National Industrial Conference board in planning the conference.

Progress of Mohawk Paper Makers

The Mohawk Paper Makers, Inc., in Cohoes has nearly completed the program of improvement laid out by Harry I. Prankard its president, when that corporation took over the two mills at Cohoes and Waterford, N. Y.

The new hydro-electric plant at Cohoes will be completed and in operation during December. The 700 K. W. generator is now being set, and the hydraulic work and power plant building are within a few weeks of completion. The mill has been running on purchased power since its construction in 1917, so that this new power development will result in a very large reduction in production costs.

Stokers have also been installed upon the boilers in the Cohoes mill, and a large number of minor alterations and repairs have been made in that mill which have brought it up to full efficiency.

The Waterford mill has been completely overhauled and rebuilt throughout and both of the machines in that mill are now in operation. The production has been greatly increased by the installation of three additional beaters and an additional Jordan which make possible a much higher speed on the two machines in that mill.

The organization in both of the mills has been entirely revamped, and practically the entire working force which formerly worked with Mr. Prankard in these mills is now back again with him. Both mills are now operating steadily twenty-four hours a day.

Waste in Pulp and Paper Industry

Why Paper Costs

By B. T. McBain, *Assistant General Manager, Nekoosa-Edwards Paper Co.*

IN days like these when timber costs are high and in many districts the supply nearly used up; when labor costs are at a point almost at the peak, and when freight rates are as high as they have ever been—in fact, when almost all raw materials that go into the manufacture of pulp and paper are soaring almost out of sight, why do paper manufacturers go to the expense of installing expensive cost systems and then quote prices that must be far below their costs, seemingly without paying any attention whatever to what these costs might be, just because someone else, for foolish reasons or otherwise, steps into the market and cuts the price?

Cutting prices never made a market and never will. During the past month some of the largest paper manufacturers in the United States have seen fit to cut prices on their product to a point where the profit must be entirely gone, or as some of the jobbers are putting it, they must have made a huge profit at the old price; and are going back only a short time to correspondence or verbal statements in which they were informed that prices could not be met because those prices were lower than their cost, whole now the price they are naming is lower than the price asked for at that time.

Mills have been started in the South and some other mills have added to their equipment but the total tonnage added to the production of the wrapping paper mills of the country during the year 1923 is less than 10% of the former total, and as very few additions were made to the wrapping paper mills during the past five years the average increase during that period is far less than the average increase in production in other lines.

When prices were cut nothing was gained; the jobber lost heavily on his stocks; the mills will lose even more on any stocks of paper they may have at their plants; the buyers are afraid to place orders for the usual stocks carried at this time of the year and are only buying their actual requirements.

There are laws against stealing and there are laws of other kinds which prevent waste and destruction of the property of others and there should be laws preventing manufacturers, or anyone else, from offering for sale products of any kind at a point below cost where it tends toward the destruction of the property of their competitors like the reduction in prices in the paper market during the past month have caused and will continue to cause if they remain in effect.

The maintaining of prices at a decent living level where living wages can be paid, and proper prices paid for raw materials, that those engaged in production in those lines may likewise live, should be allowed under the law, and the sooner our dear Uncle Sam arranges to protect the industries of our country, not only against foreign countries by protective tariffs, but against foolish practices on the part of a few in the industries at home, the sooner will all of his citizens prosper.

This waste in selling today is the greatest waste in the paper industry. If cost systems are good, why not use them and sell accordingly; if they are not good or of any use, then WHY?

No Lockout in Norway

The threatened lockout of 15,000 or more pulp and paper mill workers in Norway has been averted. This is the information received by the American Paper and Pulp association which has been keeping informed of conditions through cablegrams. Reports that the lockout had gone into effect were erroneous, and an agreement has been reached between the workers and the employers.

A cablegram stating that the lockout, several times postponed, had finally gone into effect was followed by another message stating that the lockout had been averted at the moment by an agreement which will prevent labor difficulties for many months. Other messages however, which also announced the lockout, had been received elsewhere in the United States and had been given publicity, but the last minute settlement was not similarly announced. The lockout, therefore, was not at any time effective.

Changes in H. B. Wadsworth, Inc.

At a regular business meeting of H. B. Wadsworth, Inc., the following officers were elected: Jessie B. Wadsworth, president and treasurer, M. Deeves, vice president, M. Serling, secretary.

There will be no change in the business policy of the firm. All connections in the jute board, pulp, pulp stones and general paper making supplies will continue.

C. N. Quinn who was formerly connected with H. B. Wadsworth, Inc., has re-established himself with this firm to take charge of the sales department. Mr. Quinn is a well known figure in the trade, having had former connections with R. F. Hammond, Inc., Howell-Donaldson, Inc., and the Craig-Becker Co., all of this city.

C. A. Wadsworth who was formerly connected with the sales department of H. B. Wadsworth, Inc., has resigned to take up other interests.

Garvan Charges Conspiracy

Thomas S. Garvan has brought suit in the Superior court at Hartford, Conn., for the removal of his brother, John S. Garvan, as president of the paper manufacturing company of P. Garvan, Inc., of that city and also to recover the sum of $200,000.

P. Garvan and his two sons incorporated the business in 1905 and the father was president of the company until his death about 1913 when Thomas became president of the company. Two years ago, however, the directors elected John Garvan to the presidency. The complaint charges that the plaintiff was deprived of the office of president through conspiracy.

When the corporation was formed it had a capital of $105,000, but in 1921 this capital was increased $1,500,000. At the time of the death of P. Garvan the two sons shared equally in the stock of the company. Later J. Gilbert Calhoun and William A. Riley were admitted to the directorate, each holding two shares of stock, it is claimed, for the purpose of reorganization of the company. Calhoun and Riley are made co-defendants in the suit. Thomas Garvan charges conspiracy in the manipulation of the four shares of stock making possible the presidency passing from his hands.

Paper Exports Increase

Exports of paper from the United States during October were valued at $2,118,841, an increase of approximately 5 per cent over those of September, 1923, and October, 1922, according to compilations by the Paper division of the Department of Commerce. Shipments by quantity and value during the three months mentioned are shown in the following table:

	October, 1922		September, 1922		October, 1923	
	Quantity Pounds	Value Dollars	Quantity Pounds	Value Dollars	Quantity Pounds	Value Dollars
Newsprint ..	2,260,546	108,674	2,388,067	112,953	2,246,965	109,884
Book Paper not coated .	1,853,530	193,126	2,010,098	237,487	1,651,988	210,027
Wrapping paper, inc. kraft .	2,706,109	181,927	2,042,653	168,390	1,744,339	146,018
Paperboard and Strawboard	3,651,122	167,736	4,811,107	217,386	4,911,220	210,440

Paper Industry Backs Mellon Plan

A referendum taken by the American Paper and Pulp association on Secretary Mellon's proposal for tax reduction has resulted in over 95 percent of those replying voting in favor of the Mellon proposal, and against a bonus for able-bodied veterans.

This questionnaire was sent out so that the association might be able to speak with authority as to the attitude of the paper industry on the tax program.

The referendum provided that the federal government in the opinion of the industry, should do all within reason for the care of sick and wounded veterans. The first two questions were answered almost unaniomusly against the bonus, and for the tax proposal. Questions as to specific proposals of Secretary Mellon, varied only slightly from the replies to the general proposal.

Paper Novelty House Expands

The Orchard Paper company, of St. Louis has purchased the three-story building at 1113-1126 South Twelfth boulevard, St. Louis, and will establish a modern paper merchandising plant, having outgrown its old quarters at 713 Spruce street.

The new quarters of the Orchard company contain 54,000 square feet of floor space and until recently was occupied by the Robert Gaylord company, box manufacturers. It occupies 100 feet on the west side of Twelfth boulevard and extends 132 feet to the rear. It is the purpose of the Orchard company to remodel the building to be used for a plant for the manufacture of paper novelties, as well as for warehouse and office space. A new front of steel sash and stucco construction will make the building one of the more pretentious business buildings of its kind in the city. The interior will be equipped with a sprinkler system and all modern fixtures.

The Orchard Paper company, now the only manufacturer of printed box coverings and trunk lining papers west of New York City, was organized in 1920 by Herman C. Orchard, Charles P. Orchard, Louis Weenick, Thomas J. Lineback, Joseph A. Ent and Sidney Strauss, all of whom are now actively engaged in the business. At the time of organization the company leased the property at 713 Spruce street occupying the first three floors. So rapidly did the company grow that soon the entire building was occupied and outside space rented.

At is inception the Orchard company was almost exclusively devoted to wrapping papers and cordage. During the past two years the company has extended its activities to the converting field and is handling many paper specialties.

The building just purchased will be improved at once and according to present plans the company will occupy the remodeled structure about March 1, 7924.

Kraske Goes to Canada

Captain William Kraske, sulphite superintendent of the Consolidated Water Power & Paper company of Wisconsin Rapids, Wis., has resigned his position with that company, and has gone to Kapuskasing, Ontario, Canada, to take the position of superintendent of the Spruce Falls Co., Ltd., a trading sulphite company of Canada.

During his residence in the city of Wisconsin Rapids Mr. Kraske was captain of Battery E. 120th Field Artillery and regarded by state national guard officials as one of the leading guard officers. He also served the city as Alderman.

Mr. Kraske has been secretary of the Northwest division of the Superintendents association and was re-elected at the recent Appleton convention. He has done some fine work for this association and this division is one of the livest in the association.

Advisory Committee to Meet Wallace

Secretary Wallace of the United States Department of Agriculture has asked the recently selected advisory committee from the paper industry to the United States Department of Agriculture to meet him during the week of January 7 for its first meeting.

He is anxious to take up with the paper industry, through this committee, the problems of forestry and technical problems which are handled through the Department of Agriculture, through to the United States Forest Service, Forest Products Laboratory and the other departmental laboratories and similar agencies of Wallace's department.

New Machine at Biron Mill

The new Biron mill of the Consolidated Water Power and Paper company made its first paper Thursday, November 29, and is making a good grade of newsprint at 700 feet per minute.

This machine was built by the Beloit Iron Works, and is designed to run at speeds up to 1,200 feet per minute.

Everything started off like an old machine and as fast as the operators become used to the machine at faster speeds it will be speeded up.

The Woodsome system of drying is one of the late inventions in use and the Thiel economizer is a part of the hood equipment over the dryers.

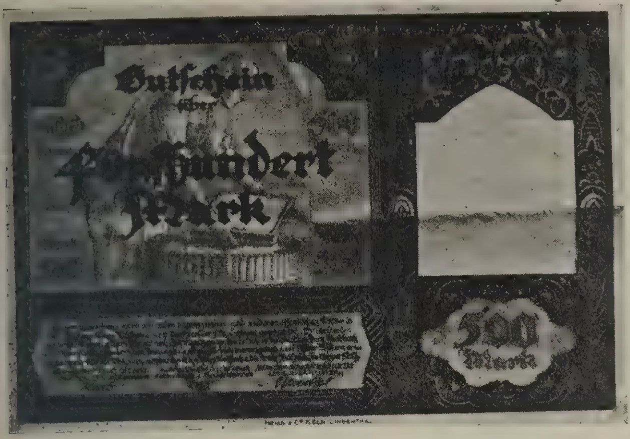
The Portland Pulp and Paper company have filed articles of incorporation in Salem, Oregon. The incorporators of the new company, which has a capitalization of $1,500,000, are Roy H. Mills, of Portland, D. J. Fry and F. D. Thielson, both of Salem, Oregon.

Three tracts of waterfront land south of Oregon City, Ore., were recently purchased by the Hawley Pulp and Paper company which has a plant in the city and in the near future will build another either in Oregon City or some other place in Oregon or southern Washington. The buying of this land, valued in the deeds at $20,000, may mean that Mr. Hawley has definitely decided to locate the new mill in Oregon City.

The accountants of the Crown-Willamette Paper company's five paper mills, two in Oregon and one each in California, Washington and British Columbia met in a convention at Portland, Oregon, the third week in November. The meeting was presided over by officials from the head office of the company located in San Francisco, California.

Honoring the Papermaker

Writing to a friend connected with PAPER, Dard Hunter, the philosopher-papermaker ot Chillicothe, O., enclosed a photograph of which the accompanying illustration is a reproduction.



He says, "A friend of mine who is connected with the J. W. Zanders paper mill has just sent me a 500 mark banknote from Bergisch Gladbach. This note is, so far as I can ascertain, the first banknote ever produced on which a handmade papermaker was shown."

Fireproofing Paper

An interesting demonstration of the possibility of making paper fireproof was shown by the cover of the November 14 issue of Fire and Water Engineering.

The four page cover was fireproofed with a special chemical solution by the First Fireproof Paper Co.

I. H. Case, general manager of Fire and Water Engineering, says "The paper, our regular 75 pound coated stock, was sent to their laboratory for treatment before printing and notwithstanding this it went through our presses without any trouble whatever."

The paper was not changed in any way that was apparent to the eye or touch and when held in an open flame was only slightly charred in the spot immediately in the flame.

Plans of Elam Paper Co.

Lowell P. Rieger, treasurer and one of the large stock holders of the Peerless Paper company of Dayton, Ohio, has recently resigned as treasurer of this company, disposed of his holdings therein, and accepted a vice presidency and treasurership of the Elam Paper company of Marion, Indiana.

Plans for the removal of the plant of the Elam Paper company to Dayton are now being rapidly pushed and officials of the company say that the change will probably be made some time around the first of January, 1924. The Elam Paper company is one of the largest manufacturers of personal stationery and tablets for school use in the Middle West. Their 1923 production up to the first of December, 1923, totaled over a million and a quarter dollars.

Officers of the company are S. L. Elam, president; J. H. Schaumleffel, vice president; Virgil Schaeffer, secertary; and L. P. Rieger, vice president and treasurer. These together with Albert Hersing, St. Mary's, Ohio, vice president of the Peerless Paper company; Chas. W. Roth of the Buntell-Roth company; and Willard Elkins, president of the City Trust and Savings bank, Marion, Indiana, comprise the board of directors.

Upon completion of the removal of the plant to Dayton, it is contemplated that employment will be given to approximately two hundred and fifty people, may of whom will come from Indiana.

Mr. Rieger's long expreience in the paper business should be a great benefit to the Elam company and his many friends in the paper trade wish him every succes in his new enterprise.

Paper Exhibit at Milwaukee

The paper mills of the state of Wisconsin are very well represented at the Manufacturers' Exposition held in Milwaukee. The exhibit is in charge of C. A. Fourness of Kimberly-Clark Co., of Neenah, and F. H. Rosebush of the Nekoosa-Edwards Paper Co., Port Edwards.

The various grades of paper manufactured by the different mills are on display and in original packages and the decorations of that section of the building are all suggestive of the pulp and paper business from the trees to the finished product.

This is the second year that the paper mills have shown a keen interest in this exposition and it gives the public a chance to learn something of the magnitude of the industry in the state of Wisconsin.

New Dam at Tomahawk

The Wis., dam for the new paper mill and power development at Tomahawk, Wis., is completed and the power house will be enclosed at a very early date.

This power house will be unique in that it will not require operators inattendance but will be automatic, both as to operation and changing of load.

The paper machine is being rebuilt and when this plant is ready for operation it is stated that it will be equipped with the latest labor saving devices in every department and the conversion cost will be at a minimum.

New Mill for Paterson Parchment Co.

The accompanying illustration shows an interesting view of the construction work on the new plant of the Paterson Parchment Paper company at Edgely, Pa.

The view shows unit No. 1 of an ultimately larger mill. This unit will have two paper machines, a total floor area of 350,000 square feet and a power plant of 5,000 kilowatts ultimate capacity. The plant is on the Delaware river near Trenton, N. J., and will utilize about 5,000,000 gallons of water per day.

The new mill was designed and built by Abbott, Merkt and company, of New York.

New Book on Chain Application

Of interest to every saw mill or pulp and paper mill man is the new book on chain and chain application, recently issued by the Link-Belt Company.

One hundred and twenty-eight pages in extent, it illustrates and describes various types and classes of chain used in this industry. The liberal use of photographic reproductions fully illustrates the application of these chains. Complete data regarding tensile strength, size, weight and prices is given in tabulated form.

The new book also covers, briefly, such equipment as the electric hoist, locomotive and crawler cranes, belt conveyors, coal handling equipment, log stackers, sprockets, clutches, etc. Each subject is illustrated and described.

Copies of this new book, known to the Link-Belt Company as No. 660, are obtainable at any of their plants in Indianapolis, Chicago or Philadelphia.

William Squires Warren

William Squires Warren, until about a year ago general superintendent of the Crane & Co. paper mills at Dalton, Mass., died Nov. 27 at his home, 58 Curtis avenue, Dalton, aged 68 years. He had been superintendent of the company since 1889. He was one of the best known paper mill officials in New England, particularly as having charge of the mills which produce the paper for the federal government.

He was born in Dalton, June 21, 1855, the youngest of four children. His family had lived in Dalton since his great grandfather settled there in 1775. He went to work at the Bartlett & Cutting paper mill when he completed school, their mill being located on the site of the present Centennial mill of the Byron Weston Paper Co. Then he went with Carson & Brown, now the Old Berkshire mill in Dalton. He learned the business thoroughly and went to the Carew Manufacturing Co. at South Hadley Falls as superintendent. He then returned to Dalton to become superintendent of the Crane mills. He invented and perfected many machines used by the company in its manufacture of the government bank notes.

He was twice married and is survived by six children. He was past master of Unity lodge of Masons, president of the Dalton library trustees, secretary of the Saturday Evening club, trustee of the Dalton Y. M. C. A., 32nd degree Mason and a member of many other organizations.

Value of a Perpetual Appraisal

The perpetual inventory of raw and finished stock is now almost universally accepted as essential to the close executive control of any manufacturing business, says William R. Bassett, president of Miller, Franklin, Bassett & Co., Inc., New York City.

The perpetual inventory, or appraisal, of equipment is an almost equally valuable aid to the management, although it has not yet been widely adopted. A physical appraisal, because it is expensive to make, is a comparatively infrequent happening in most concerns.

In the 4 to 10 years between appraisals, great changes take place in value and location of the equipment, which, unless reflected in the manufacturing costs and in the income tax returns, may have serious effects upon the profits.

The best way to gather overhead is by departments. Each department's overhead includes a round sum for depreciation on equipment. If a machine is moved from one department to another, changes in the overhead to reflect that change should be made. Too often it is not. In a concern operating under a cumbersome bookkeeping system, I once saw depreciation charged on an expensive machine for years after the machine had been sold for scrap. In the same plant, one department carried the same amount of depreciation charges after additions had been made, which doubled the amount of equipment in that department.

An excellent perpetual appraisal record consists of one card, or loose leaf sheet for each machine. These can be grouped into departments. On the card is recorded the first cost, the freight, the cost of installing, the cost of major repairs, the depreciation rate and amount, and the present value. If the machine is moved to another department, that fact is noted on the card, and the card is transferred in the file to the new department.

There you have a complete record of every bit of equipment in the plant, by itself, and not buried with a mass of other figures in some general capital account. It is easy to operate, and invaluable as a control.

New Booklet by Mead Pulp and Paper Co.

With the coming of the new year an interesting one hundred page booklet, describing in detail how paper is made in the plant of the Mead Pulp & Paper company, of Chillicothe, together with a history of paper making in Ross county and other interesting data and information pertaining to the Mead plant, will be published.

This series of articles on paper making appeared throughout the year 1923 in "Mead Co-operation," the plant magazine published by the Mead Pulp & Paper company. When completed and ready for distribution, the booklet will be given to each employe in the Mead plant and additional copies will be given to the general public upon request, or when interested persons call at the plant and request to be shown through the mill.

It is hoped that the booklet will be the means of making better workmen, and also that through its distribution, the citizens of Chillicothe may come to know more of one of the city's larger manufacturing plants.

Pusey & Jones Make Foreign Shipments

The Pusey & Jones Co., Wilmington, Del., has completed the shipment of a large paper-making machine to Kymmene Aktiebolag, Kota, Finland, one of the largest independent newsprint companies in Europe. The company has other Pusey & Jones machinery in service, having been installed a number of years ago.

The new machine weighed about 900 tons, with value placed in excess of $250,000. It is said that the contract for the machine was secured in the face of heavy competition with England and Germany, as well as Scandinavian paper machinery manufacturers.

American Trade With British Colonies

The difficult problem which the imperial conference at London is investigating, of how to favor the colonies by establishing preferential inter-tariffs between the countries of the British Empire, is rendered more complicated by the fact of the large trade between the colonies and other countries outside of the empire—notably with America—some of which might be much disturbed by discriminating tariffs.

Among the things America buys from the colonies is wood pulp and pulp wood, of which we import nearly $100,000,000 worth a year, as against $25,000,000 worth in 1913. This comes to us largely from Canada.

Holiday Greetings

THE joyful season is at hand when everybody feels inclined to sing the old refrain, "Peace on earth, goodwill to men." It is the hope of PAPER that everyone of its readers will enjoy a Christmas filled with genuine happiness and good cheer and that the New Year may bring to many a happy realization of fond hopes and ambitions. Cordial good wishes are extended for a joyous celebration at the holiday season and we hope that all will enjoy a generous measure of happiness, contentment and prosperity both now and throughout the years to come.

The Coal Tar of the Pulp Industry

IT was to be expected that Professor McKee's address on a new method of fermenting the spent liquors of the sulphite mill for the recovery of alcohol as a by-product would excite comment, but we were hardly prepared for the amount of interest that was developed in the subject. To our own comments on Professor McKee's reference to the wasteful methods of pulp manufacturers, our old friend Martin L. Griffin, formerly of the Oxford Paper company and now with the Mt. Hope Finishing company, supplies a contribution dealing with the economics of recovery processes in general, but particularly as applied to sulphite and soda mill waste lyes.

Mr. Griffin is inclined to be pessimistic regarding the possible commercial outcome of any research looking to the recovery of valuable by-products from waste sulphite liquor. In this he takes a stand in opposition to many chemists who have made a study of the subject and whose judgment in this matter is of some weight. There was the late Charles Proteus Steinmetz, whose early training was that of a chemist and who had studied in an interested way the possibilities of sulphite waste liquor as contrasted with the waste coal tar of the steel industry, which at one time was considered of no value but which has since become the foundation of a great aniline dye industry, the possibilities of which have by no means been exhausted.

It is difficult to convince the pulp and paper manufacturers that a profit is to be made by the utilization of one group only of the substances which are extracted from the wood in the process of cooking it. The object of cooking wood in pulp making processes is, of course, to lay bare the skeleton of the tree, perhaps more properly the gold of the tree—its cell walls of cellulose. The group of substances referred to are the natural sugars of the wood, which may be fermented to yield after distillation alcohol to the amount of about one part in one hundred of the total quantity of waste liquor. There are ketone bodies and other chemical combinations, to say nothing of coloring substances, hidden away, in the liquor, and the Patent Office files will show that more than one attempt has been made to extract and make use of them.

It is the contention of several chemical authorities that valuable by-products other than alcohol can be separated from the liquor. The outlook is no whit more discouraging than that which confronted the early investigators of that one-time ill-esteemed waste product from the old beehive coke ovens of the steel industry, and see what a magnificent array of chemicals has resulted from the foundation of the modern industry of synthetic dye-stuffs and pharmaceutical products. It is not to be hoped that anything like an equal variety of new products can be recovered from the pulp mill equivalent of coal tar, but it may be that intensive research conducted along new lines would be well worth undertaking.

W. B. DuBois, vice-president of the Columbia River Paper Mills corporation at a meeting of the Vancouver city council declared that his company, which furnshed employment for several hundred men and contributed to the city's taxes, should not be put on the same basis as outside saw mills when it came to paying rental for a municipal dock. The city council then decided to rent the corporation 300 feet of the east end of the municipal dock for $250 a month instead of charging it the same rate as other mills were paying which would be approximately $1,000 for the space it used. At a previous meeting of the city council action had been taken to make the company pay the same rates as the outside industries were paying.

The Eaton Crane & Pike Co., of Pittsfield, Mass., has acquired the business of Z. & W. M. Crane Co., of Dalton, Mass., and will take over the business on January 1. The purchase of the property does not include the machinery of the latter company, it is understood but what disposition will be made of it is not yet announced. The Z. & W. M. Crane Co. manu-

Construction News

Portland, Ore.—The Portland Pulp & Paper Co., recently organized with a capital of $1,500,000, Roy H. Mills, 815 Broadway building, president, has plans in progress for a new pulp and paper mill on site selected on the Peninsula, North Portland. The main unit will be 80x300 feet, with a number of smaller buildings, including power house, and machine shop. The new plant is estimated to cost close to $1,200,000, with machinery, for which orders will be placed at an early date. It is expected to break ground in January. Others interested in the new company are Daniel J. Fry and F. D. Thielsen, both of Salem, Ore.

Crighton, Ala.—The Gulf Paper Co., Mobile, Ala., has tentative plans under way for the rebuilding of the portion of its local mill, recently destroyed by fire with loss estimated at close to $200,000, including equipment. J. M. Walsh is president, and G. H. Mackie, local manager.

Battle Creek, Mich.—The Michigan Carton Co., will commence the immediate erection of a two-story building at its plant, 170x270 feet, to be used for warehouse and operating service, replacing a structure recently destroyed by fire. It is estimated to cost about $40,000. M. J. Moredouse, 343 South Dearborn street, Chicago, Ill., is architect.

Philadelphia, Pa.—The Philadelphia Paper Mfg. Co., River Road, has awarded a contract to the Hughes-Foulkrod Co., Commonwealth building, for alterations and improvements in one of its buildings.

Oregon City, Ore.—The Hawley Pulp & Paper Co. has preliminary plans under advisement for the construction of a new mill in the vicinity of Third and Main streets, with power house and auxiliary structures, estimated to cost close to $1,000,000. It is expected to carry out the project during the next twelve to fifteen months.

Hadley, N. Y.—The Hadley Paper Corporation has tentative plans for the installation of transmission equipment at its plant, including shafting, pulleys, etc. R. H. Redlin is manager.

Mooresville, N. C.—A. K. Mallard has plans for the establishment of a local plant for the manufacture of paper boxes and containers. Inquiries are being made for machinery and operating equipment.

Menasha, Wis,—The McGillan-Asmuth Paper Mills, Inc., manufacturer of tissue papers, etc., is said to have plans under consideration for the construction of a new addition to its converting plant, providing for extensive increase in output, practically doubling the present capacity. It will cost in excess of $100,000.

Troy, N. Y.—The Albia Box & Paper Co., Pawling avenue, plans for the installation of pulleys and other transmission apparatus. J. M. Webb is superintendent.

Prince Rupert, B. C.—The Prince Rupert Sulphite Fibre Co., Ltd., recently organized, is perfecting plans for the erection of a new plant for the production of bleached sulphite pulp. It will consist of a number of buildings, to be equipped for a daily output of about 90 tons, estimated to cost in excess of $250,000. A portion of the machinery has been ordered and it is said that other contracts for equipment will be awarded in the near future. The company has taken over extensive property in this section, including the Emerson lumber mill and timber lands.

Midland, Ont.—The International Fibre Board Co., has preliminary plans for the construction of a new mill, to replace its plant at Penetanguishene, Ont., recently destroyed by fire. It is expected to commence work and and place equipment orders at an early date.

Muskegon, Mich.—The Central Paper Co., has finishing work well under way on a new mill addition for considerable increase in production, and plans to place the structure in service at an early date.

Chelsea Falls, Que.—The Riordon Co., Beaver Hall square, Montreal, is having plans prepared for the construction of a new power plant on the Gatineau river, near Chelsea Falls, estimated to cost in excess of $100,000. The Montreal Engineering Co., 164 St. James street, Montreal, is engineer.

New Companies

Albany, N. Y.—The Thomas J. McCormick Paper Corporation has been incorporated with a capital of 1,000 shares of common stock, no par value, to manufacture and deal in paper products. The incorporators are T. J. McCormick, C. B. Martin and C. T. Jewell. The company is represented by W. L. Collins, Albany.

Wilmington, Del.—The Carpenter Container Corporation has been incorporated with a capital of $5,000,000, to manufacture paper boxes, containers, etc. The company is represented by the Corporation Trust Co., of America, du Pont building.

New Haven, Conn.—The H. S. Hershman Waste Paper Co., has been incorporated with a capital of $50,000, to deal in paper goods. The incorporators are Harry S. and Isidore Hershman, 153 Minor street, New Haven.

Financial

Childsdale, Mich.—The Plainfield Paper Co., has arranged for an increase in capital from $150,000 to $300,000, for proposed expansion.

Kalamazoo, Mich.—The Eddy Paper Corporation has cancelled preferred stock to an amount of $350,000, comprising an entire issue held in the company vaults, placing the outstanding stock at 125,000 shares, common, no par value.

Detroit, Mich.—The Paper Products Co. has filed notice of change of name to the American Milk Cap Co.

Montreal, Que.—Price Brothers & Co., Ltd., has plans under consideration for taking over the Saguenay Pulp & Paper Co. and the Bay Sulphite Co., both companies having been affected by the failure of Becker & Co. It is said that the new owner, should the acquisition be arranged, will operate the two companies at maximum.

Improvement in Belgian Paper Market

The paper market was more active during September because of exchange fluctuations, Consul Clinton E. MacEachran, Antwerp, informs the Department of Commerce.

Paper prices advanced from 5 to 10 per cent, while wood pulp prices increased from 10 to 20 per cent. A good inland demand resulted from the increase in the value of the Belgian franc, which, however, stopped when the exchange dropped at the end of the month.

The earthquake in Japan slowed up the export demand, there being many cancellations of orders in Japan, especially for paper not containing mechanical ground wood. On the other hand an increased demand from the United States was noted.

C. A. Wadsworth, who has been connected for several years with H. B. Wadsworth has resigned from H. B. Wadsworth, Inc., 51 E. Forty-second street, New York City, and opened his own office for the sale of pulp, paper and a general line of mill supplies at 342 Madison avenue, room 906, telephone Vanderbilt 4835.

Joseph B. Weis, president of the Perfect Safety Paper Co., of Holyoke, Mass., has been elected president of the Holyoke Chamber of Commerce by the board of directors of that organization. He succeeds Archie J. Osborne.

Forestry in the Paper Industry

Conducted by J. R. Simmons, Secretary Forester,
The New York State Forestry Association

Pinchot's Proposed Forestry Bill

Governor Pinchot has made public the text of a forestry bill which he offers to the United States Senate Committee on Reforestation as a means of solving the forestry problems.

A study of the bill indicates that it is the same proposal in a different form that Governor Pinchot made when he suggested the use of interstate commerce as a means of taxing the lumberman who does not live up to the highest forestry principles in the handling of his private acreage.

The new Pinchot proposal would impose a direct tax upon the lumberman and remit in the form of a bonus most of the tax to those who cut their timber properly. The Senate Committee's own bill will be forthcoming shortly, and it is not anticipated in Washington that the Pinchot proposal will be followed, in fact, some students of the situation in Washington go so far as to say that the Governor's success in settling the coal strike at the expense of the consumer does not lead to over-enthusiastic consideration of his proposal in the direction of forest policy.

After defining terms to be used in the act, the Pinchot proposal provides for the establishment of forest regions and their administration; the fixing of harvesting regulations; the classification of taxable products; instruction of operators, beginning in 1925, as to the required standards; and then provides for the payment of a "bounty" to operators of $4.95 per thousand feet for standard forest products harvested.

The next section provides for the levying of an excise tax "on the privilege or franchise of conducting the business of harvesting forest crops on commercial forest lands, measured by the quantity of taxable products produced by him in such year, as follows: for the calendar year 1925, at the rate of 5 cents per thousand, and for every calendar year thereafter at the rate of five dollars per thousand board feet standard log scale in respect of all taxable products."

Following sections provide for returns and payments under this act; for accounts and records; for field inspection and examination of accounts; for penalties for improper accounting; for details of administration.

Cooperative steps for prevention of fire, to force the states to cooperate with the federal government, and expansion of national forests are provided in the concluding sections of the proposed bill.

Indicator of Forest Fire Hazard

The United States Forest Service announces the development of an instrument known as a duff hygrometer, for measuring moisture in the forest floor. Its importance in dry weather in the forests is evident, for upon the degree of dryness of the very inflammable material composing the forest floor can readily be estimated the fire peril. M. E. Dunlap, moisture control specialist of the Forest Products Laboratory, Madison, Wis., and H. T. Gisborne, assistant silviculturist of the Priest River Forest Experiment Station, Missoula, Mont., devised the duff hygrometer after two year's work.

The instrument consists of a perforated metal tube approximately one-quarter inch in diameter and 12 inches long. This tube contains a strip of rattan which expands and contracts with changes in moisture content of the material with which it is in contact, and registers on a dial at the upper end the changes which may take place in the material being studied. The shorter end of the tube is inserted into the needles and litter on the forest floor along the plane in which a determination of moisture content is to be taken.

The instrument may be left in place and readings made directly from it at any time, or it may be moved about freely to different situations. Preliminary tests at the forest experiment station show this instrument will give a reading of moisture content up to about 40 per cent. As fire danger is not imminent when the top layers of forest litter show over 25 per cent moisture content, the range given by the instrument is sufficient for predicting dangerous fire conditions.

If the device proves satisfactory it probably will be used throughout the entire west on the national forests where dangerous forest fire conditions are likely to occur. The importance of these instruments can be realized when it is remembered that most forest fires start and spread in the litter before they develop into a serious conflagration.

University Course in Practical Forestry

A notable step for the training of forest school students in cooperation between the school and the paper industry has been taken by the University of Maine, under which camps will be established on the property of the Great Northern Paper Company with great holdings in Maine. Prof. John M. Briscoe, head of the forestry department of the University of Maine has laid out a camp course made possible through the paper company, which will provide the camps and necessary equipment for fourteen students and two instructors.

The course is made a regular part of the four-years' curriculum in forestry and is required of all senior students. The first nine weeks of the fall semester are spent as usual at Orono and the camp course, begun on Dec. 3, is to continue without interruption or holiday for nine weeks. This year, the camp is located on Rainbow Lake, in Town 2, Range 11, a splendid location about six miles south-east of Chesuncook Lake, where the celebrated Ripogenus dam has recently been completed.

Within a radius of five miles there will be some twenty logging operations during this winter, and the students will have an opportunity to get in close touch with these woods operations. Time studies on both felling and skidding will be a part of the work.

There will be three major courses: Cruising and mapping; forest management; and logging engineering.

Cruising and mapping will consist of making topographic maps and detailed estimates of standing timber; methods of locating trails, highways, bridges, telephone lines, ranger stations, look-outs, and fire-lines. Especial emphasis will be placed on methods producing practical results of sufficient accuracy at a minimum cost.

Forest management will include forestry principles involved in the practical management of a definite forest area, including organization, regulation and business administration, leading to the preparation of a complete working-plan for the area.

Logging engineering will be a course in practical logging methods as applied to a typical pulpwood operation in Maine. This will be tied up very closely with the actual woods operations of the company, and their regularly employed foresters will co-operate in the work.

Time will be kept as regular working days and all college regulations will apply to these courses as if they were given at the university. College credits will also be given on the satisfactory completion of the courses, all of which are required for a degree in forestry.

"While the course is in a way an experiment as a regular part of an undergraduate curriculum, we are looking for very favorable results from it," says Prof. Briscoe. "It will certainly help to wear off the rough edges for the men in going into practical work after graduation; and will, we believe, make them more valuable to the industry into which they are going."

Work of Bureau of Plant Industry

The year's work of the Bureau of Plant Industry described in the report recently made to the Secretary of Agriculture shows much progress in solving the problems of plant production, the control of diseases, the breeding of improved varieties, the introduction of promising seeds and plants from foreign countries and the development of methods for the utilization of perishable crops, such as fruits and vegetables. Much of the work done is of the kind which brings its greatest returns after there has been a time for the commercial development of discoveries.

In the field of forest trees, work has been carried on with white pine blister rust, which is now spreading in the northwest, and in the east the chestnut blight. The Chinese chestnut has been found quite resistant to the disease. In addition to these two important trees which are menaced, it is reported that another valuable tree, the Douglas fir, is in danger because of canker which occurs on these trees in Scotland and which already may be in this country.

"Baking" One Cause of Seedling Loss

To the many and diverse known enemies of tree seedlings must now be added "baking" or "cooking" by direct insolation.

Experiments recently conducted by C. G. Bates, at the Fremont Experiment Station in Colorado, go to prove that an entire crop of young seedlings may be destroyed by only a few hours of extreme heat absorbed at the surface of the ground about the tree stem.

This injury may be quite independent of any dryness or moisture in the soil below the surface.

Tests are now being made at the same station to determine at what point the seedling's drought-resisting power is overcome by extreme heating.

Year Book on Forestry

The forestry students of the University of Maine have begun the production of an annual year book with the 1923 issue of "The Maine Forester."

The initial year book dedicated to Prof. John M. Briscoe, head of the forestry department, consists of seventy pages with an artistic mountain forest cover page, the contents being largely prepared by students of the department.

Samuel T. Dana, formerly forest commissioner for the state, has an article describing the manner in which his department has handled state forest problems.

Standing Timber in Maine

The state of Maine Forest Service has just completed a survey of the amount of standing timber in the state. The report shows 11,630,000,000 feet of standing spruce, 5,060,000,000 feet of pine, 2,781,000,000 feet of cedar, 2,288,500,000 feet of fir, 1,402,500,000 feet of maple, 880,000,000 feet of hemlock, 1,123,000 cords of poplar and 1,109,980,000 cords of birch. The amount of spruce pulp now standing is given as 9,610,000,000 feet and fir pulp as 1,943,000,000 feet.

Aroostook county leads in having the largest amount of standing timber of Maine's sixteen counties and its proportion of spruce is 3,500,000,000 feet. Piscatiquis and Somerset counties come next in order.

Interested in West Coast Timber

That the trend of interest in the Pacific coast timber is extended in the paper industry is shown by a letter received by Dr. Hugh P. Baker, executive secretary of the American Paper and Pulp association from the College of Business Adminstration at the University of Washington, which states that many requests for information concerning pulpwood and the paper industry on the Pacific coast were being received by that college.

The inquiries touch such subjects as newsprint production in states such as Washington, Oregon and Idaho; production of different classes of paper such as wrapping, book, cover, boards, etc.; and consumption of news and other papers.

Food For Thought

The United States contains 465,000,000 acres of forest land, public and private.

There is an area of devastated forest land in the United States approximately 85,000,000 acres, to which more is being added annually. This tract is as large as the combined states of New Hampshire, Vermont, Massachusetts, Connecticut, Rhode Island, New York, Pennsylvania and New Jersey.

Forest fires burn over an area of 12,000,000 acres in the United States every year.

Endorse Forest Policy

The National-American Wholesale Lumber Association has voted in favor of the recommendations made by the special committee of the National Chamber of Commerce on the question of national forestry policy, except number five.

In other words, the association favors the proposed forestry policy except that it is opposed to the creation of a National Forest council "to have functions of advice to administrative officials."

Monarch Co. Settles Damage Suits

Twenty-four cases against the Monarch Paper company, of Kalamazoo, Mich., growing out of the great flood of June, 1916, have been settled out of court after weeks of negotiations between the parties and after one of the cases, that started by Jacob De Moyer, had been placed on trial.

De Moyer and the other plaintiffs charged the losses of their celery crops in 1916 and of other property was due directly to the alleged negligence of the Monarch company in the construction and operation of the dams which broke under terrific pressure during the storm and flooded a wide section in the southeastern part of the city.

The basis of settlement was not made known by the attorneys, but it is understood the plaintiffs received a substantial sum.

The Bryant Paper company was made joint defendant with the Monarch company in the original suits, but the trial judge dismissed the charges against the former. The Bryant Paper company, in an action two years ago against the Monarch company, based on the same allegations as those made by the plaintiffs in the twenty-four suits just disposed of, recovered damages in the sum of $40,000.

New Developments in Paper Making

Safety Tint Paper

British patent No. 202,702 is concerned with a process for making safety paper for check and bond making. The process consists in obtaining the impression of a line geometrical design on the printing plates having the character of a machine-made design but with a variation in the width of the loops so that mechanical reproduction is impossible. Moreover, the lines are differently colored in different portions so as to prevent photographic reproduction.

* * *

Bamboo Pulp

According to a Japanese invention in boiling bamboo with alkali, alcoholic extract of oak is added to prevent decomposition of the fiber itself and to decrease the loss of fiber.

Bamboo pieces, 3.75 kilograms, are boiled with 225 grams of a sodium hydroxide, 2.16 liters of water and 0.27 liter of the alcoholic extract. The pulp which is obtained in this manner is then washed with water and bleached.

The alcoholic extract is prepared by treating 450 grams of sliced oak with 80 grams of 85 to 90 percent alcohol of 50 degrees Be.—The World's Paper Trade Review.

* * *

Paper With Rubber Latex

This is another Kaye patent in which rubber latex is added to the beater. The rubber is vulcanized by the addition of sodium sulphide to the batch in the proportion of 4.55 liters of a 30 percent rubber latex to 340 grams of sodium sulphide. The rubber paper thus contains about ten percent of sulphur calculated on the weight of rubber. A little acid may also be added to aid in the coagulation of the rubber, but when sulphite pulp or other similar pulp is used which always contains a little acid, it is not necessary to add acid for coagulation. Similarly when the paper is to be sized with rosin and sulphate of alumina, it is not necessary to add acid. German patent No. 379,997.

* * *

Bleaching Tests on Sulphite Pulp

Certain experiments were carried out on the bleaching of sulphite pulp according to an article which appeared in Der Papierfabrikant in which the bleaching was accomplished by means of chlorine in one series of tests and by means of bleaching powder in another series. The Rittner-Kellner pulp was suspended in water and under normal condition was bleached to a full white in five to six hours with the consumption of 3.2 percent of chlorine in the form of bleaching powder and a loss of weight of 3.5 percent. By passing chlorine gas through an aqueous suspension of this pulp it was impossible to bleach a full white.

The absorption of chlorine was rapid at first, but after 2.5 percent of chlorine had been absorbed further quantities of the gas passed through unchanged. Greatly superior results were obtained by a combined chlorine and bleaching powder process whereby the pulp was first treated with chlorine water, then washed either with water or caustic soda lye, and finally bleached with ordinary bleach liquor. It was found advantageous not to use so much chlorine gas in the first treatment as was required to saturate the pulp, but to employ only 0.85 to 0.86 percent of chlorine in the form of chlorine water.

Practically the whole of this was usefully absorbed. The pulp was then washed either with water or with caustic soda of one percent concentration. In the latter case the extract was dark reddish-brown in color. The secondary bleaching was performed with ordinary bleach liquor, and the consumption of chlorine in this process required to produce a good water white was 0.85 percent in the case of the pulp washed with water and 0.58 percent in that which had been extracted with soda. By using the combined method the total quantity of chlorine required to bleach the pulp could be reduced by 45 to 54 percent as compared with the simple bleaching power process.

* * *

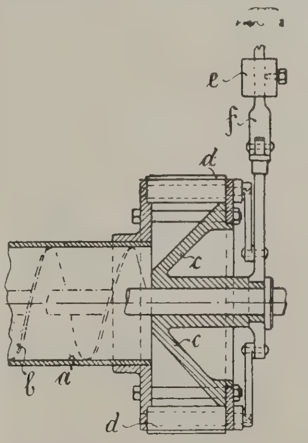
Imitation Hand Made Paper

British patent No. 203,993 is concerned with a process for the manufacture of imitation hand-made card and paper. The process consists in obtaining sheets of different forms made from machine made paper or cardboard having gradually reduced edges and an irregular, frayed or broken-out line. This is done by passing between the rollers or cylinders of a rolling mill a pile of moistened sheets of machine-made paper resting upon a bearing against blunt and irregular or sinuous ridges or the apices of projections having a triangular section with a broad base formed on a metal plate and by reproducing the desired outlines of the pieces of paper or cardboard imitating hand made materials.

* * *

Beater With Accelerating Device

The diagram shows an arrangement for increasing the rapidity of the beating action in a beater. This consists of a channel that is built into the beater roll. In the figure this is seen to be composed of the cone-shaped part c, which surrounded by a number of valves d, located one over the other and under regulated pressure. These parts form the upper end of an inclined tube a, in which there is built an ordinary screw conveyor b. The stock that is being beaten is forced into the inner side of the valve or flap by means of the screw conveyor. There is a certain amount of resistance offered by these flaps owing to the counter-weight arrangement shown at e in the figure. When the pressure is to high that the effect of the weight e on lever f is overcome the valve or flap is caused to open slightly and the beaten stock can force its way through the same.



The pressure that is exerted against the stock which comes in contact with the sharp edges and corners of the flap valves bring about further beating or disintegration of the fibers. Furthermore, when the stock passes through the small opening left by the flap valve it is subjected to a centrifugal force which further serves to beat the fibers, so that when the pulp leaves the beater it is in a fine condition to be made into paper. The beating action of the machine is accordingly accomplished at greater speed than in the ordinary type of machine with subsequent saving in power. This apparatus is patented in German patent No. 373,035.

Doings in Canadian Paper Field

Move to Control Sulphite Export

One of the things now being mooted in Canadian pulp and paper circles is a proposal that a large export corporation be formed for the marketing of the products of Canada's sulphite paper mills. This has arisen out of the unsatisfactory situation prevailing in the sulphite market, which is subject to violent fluctuations with serious losses to investors.

It is suggested that it might be called the Canadian Export Sales Corporation and that it should have the financial backing of all producers of sulphite pulp in Canada. It would have charge of all export sales of Canadian sulphite pulp and would be supported by a moderate commission of probably three per cent of the selling price of all pulp marketed through this organization.

In support of the proposal it is claimed that such a corporation would immediately become the controlling factor in the world's sulphite pulp market, and while it would not, and perhaps could not, control prices, it would at least prevent the existing unsatisfactory state of affairs.

Just now there is a great deal of competition for American business with the result that pulp is often dumped at the market at prices considerably less than the prevailing market price with serious results. The effect of this is to be seen in receiverships for several well known corporations.

Rothermere Gets Big Timber Rights

The largest sale of timber limits in the history of Quebec, 2,500 square miles in the basin of the Manicougan river, found English interests, said to be represented by Lord Rothermere, as the successful tenderers. There were two bids, one by the Ontario Paper Company, of Thorold, owned by the Chicago Tribune, of five cents above the stumpage dues of $2.70 per cord, and the other of the English interests of 10 cents above, or $2.80.

The successful bidder is called on to pay $1,000,000 in three installments, and in addition a ground rental of $6.50 a square mile or $16,000 a year.

The holder of these limits is obliged to erect a pulp and paper mill of 200 tons of pulp and 100 tons of paper daily capacity within five years from the date of the contract, and within seven years to bring the production up to 200 tons daily of paper.

The Rotheremere interests already have considerable investments in Quebec timber limits and in the pulp industry there.

Little Snow for Logging

The dearth of snow is handicapping pulpwood cutting and transporting operations in the woods of eastern Canada.

Last winter the chief handicap was too much snow. And instead of an over-abundance thus far this season, there is very little on the ground in some sections and none at all in other sections.

Some of the pulpwood operators and the pulp and paper companies who cut their own wood, on their own lands, had expected to transport great quantities of the wood from the woods to the railroads before Christmas, but the volume will not be one third as great as expected, unless snow falls thickly in the meanwhile.

A scarcity of men plus higher wages than usual, are also contending difficulties. However, it is likely that more men will be available after the New Year. For two months prior to Christmas many woodsmen have been cutting Christmas trees for the United States markets. After the holidays most of these men will cut pulpwood. Men are also returning in large numbers from the Canadian west where they harvested the grain.

The wages may decrease after Christmas. At present it is impossible to secure crews under fifty dollars per month and board. This is the minimum. The usual wage now is fifty-five dollars. At this period last winter the ruling wage was thirty-five dollars plus board.

Would Make Board Supreme

The Trades and Labor Congress in session at St. John N. B. demanded that the workman's compensation laws be so amended as to eliminate all future court action.

This follows the signal victory of the Bathurst Company, pulp and paper manufacturers of Bathurst N. B. over the New Brunswick Workman's Compensation Board. The company won the case and the verdict was recently sustained on appeal by the board. The company had refused to pay the exhorbitant levies of the board.

The Trades and Labor Congress contends that the workman's compensation laws were passed with a view to keep the compensation cases out of the courts. The labor leaders claim a special session of the New Brunswick legislature should be convened to amend the laws. This means that the board would be supreme in all compensation matters and there would be no appeal.

Opening of Pulpwood Harvest

Harvesting of pulpwood in Northern Ontario has begun auspiciously. A report from the Abitibi Power and Paper company at Iroquois Falls, Ont., says that the total cut from the company's limits up to October 31 was 36,090 cords, which is about 30 per cent of the total amount for the season. Snow is now being awaited and if it arrives soon the working force hopes to haul the logs in rapidly.

The letter sent out by the Provincial Department of Lands and Forests may have had some effect in helping the settlers to dispose of their pulpwood to advantage. This request was to the effect that the pulp companies buy from the settlers whenever possible.

It is noteworthy in connection with the Iroquois plant that the purchase from settlers up till October 31 aggregated 37,190 cords, and considerable purchases have been made since then.

Going After 1925 Record

In newsprint Canadian mills are expected to pass American production in 1925. Some of the very optimistic characters in the industry think that this may be accomplished in 1924, but it is generally considered improbable that the rate of increase this year can be maintained throughout next.

The record made in recent years by Canada as a producer of chemical pulp is surprising. In 1913 she ranked after the United States and Sweden in this form of production, her yearly output being 280,000 tons. In 1922 this had been increased to 680,00 tons, and now Canada is recognized as the world's leader in this respect.

Sim Samuel, formerly of the firm of Samuel & McDermott, paper jobbers, Toronto, has joined the sales staff of the Lennox Paper Mills, Camden East, Ont., and will cover Toronto, Hamilton and Western Ontario.

Dutch Paper Industry Flourishing

The paper industry of the Netherlands has been distinctly prosperous in 1923, says Consul General George E. Anderson in a report to the Department of Commerce. Imports of this commodity have declined and exports have greatly increased.

Exports of newsprint during the first nine months of the current year amounted to 21,283 metric tons, compared with 14,244 metric tons in the same period of 1922. Great Britain and Belgium have been the best customers, but 2,059 tons have been shipped to the United States.

The export of book paper containing mechanical ground wood is somewhat less than last year, shipments for the first three-quarters of 1923 amounting to only 2,283 metric tons, compared with 2,733 metric tons during the similar period of 1922. This deficiency is made up by exports of the finer grades of the same class of paper free from groundwood, shipments of which have increased from 7,747 metric tons in 1922 to 10,250 metric tons during the current year. Exports of fine bond and similar papers have also increased, 1923 shipments reaching 3,708 metric tons, compared with 3,490 metric tons last year.

Shipments of strawboard, which from the export point of view, represents the chief branch of the paper industry, likewise increased, 132,356 metric tons being sent abroad in 1923, compared with 122,091 metric tons during 1922. Great Britain as usual was the chief customer.

Seeking a Substitute for the Chestnut

Whether Chinese chestnuts shall in the future contribute largely to the dressing of the American Thanksgiving turkey is a matter of considerable interest just now to the forestry specialists of the United States Department of Agriculture. It must be confessed, however, that they are not so much concerned with the toothsomeness of our fare at this particular 29th of November as they are with the nation's future supply of chestnut timber and chestnut trees for shade trees.

Forestry specialists are investigating Messrs. C. molissima, C. vilmoriana, and others of their brothers and cousins primarily to find a species that will be a fitting substitute for the American species and at the same time resist successfully the chestnut blight which is now sweeping through the South Atlantic States and threatening to destroy utterly the American chestnut.

Experiments are under way at the Department of Agriculture's experimental farm near Washington, D. C., and also at the Appalachian Forest Experiment Station, Asheville, N. C., while in China an explorer sent out by the Office of Foreign Seed and Plant Introduction of the Department of Agriculture is searching the Himalaya uplands for new species and varieties of chestnut and closely related genera for further research work in this country.

The Indian Chestnut (C. diversifolia), a large evergreen from the mountains of Bengal, Assam, and Siam, stands in equal favor with the Chinese species; but a Japanese tree that has been tested (C. crenata), while a good blight resister, can not pass the turkey-dressing test, and is adjudged to be out of the running because of the very bitter quality of the nuts.

Our native chinquapin (C. pumila et al.) has also entered into the tests, which include cross-breeding as well as blight exposure and various climatic ordeals. The work must go on for some time yet before a definite decision can be published, but at present Molissima and Diversifolia appear to be running neck-and-neck. Two small plantings of the Chinese entrant have been made on the Natural Bridge, National Forest, and two of the Indian tree on the Florida National Forest. These will be watched especially for timber yield.

The German Paper Market

An increase on September 1 in the basic gold price of German paper, amounting to 15 per cent for wood-pulp papers and 30 per cent for the best grades free from wood pulp, has brought them definitely above competitive foreign brands, according to the Industrie und Handelzeitung of September 9, says Assistant Trade Commissioner Fayette W. Allport of Berlin, in his report to the U. S. Department of Commerce.

A minimum export price of £28 a ton (2,240 pounds), or 3d. a pound, has been fixed for writing papers free from wood pulp, while the domestic price, 0.6 gold mark per kilo, corresponding to 3.25d. a pound, is somewhat higher.

When the charges incident to export are considered it is apparent that German prices in export markets are nearly 50 per cent above the average, thus destroying Germany's competitive ability for the time being, particularly so far as staple grades are concerned.

In the domestic paper market a sharp falling off in orders is reported. Catalogues, price lists, and other kinds of commercial printing, upon which paper makers rely for a steady volume of orders, are being dispensed with and job lots of paper offered in forced sales at unjustifiably low prices have appeared on the market.

Pulp and paper manufacturers have also been harassed with production difficulties. Low water in August interfered with plant operation and the high price of imported coal added to the power problem. Pulp-wood purchases were difficult in view of the money shortage brought on by large wage and tax payments. Curtailment in pulp production led to greatly diminished stocks at the end of August and further reductions are expected in the production of both pulp and paper.

Canadian Briefs

Satisfaction with existing business conditions and optimism as the future outlook was expressed at meetings in Toronto a few days of the directors of the Provincial Paper Mills, Limited and the Interlake Tissue Mills, Limited. The mills of both companies are busy and it is expected that the yearly statement will show a good year's operations.

At a largely attended meeting of the employees of the Provincial Paper Mills' Thorold division in the town hall at Thorold a few days ago there was anenthusiastic reorganization of the accident prevention committee and a fresh campaign was entered upon along safety lines. At the meeting addresses were given by Elmer Tolsted, Chicago, A. P. Costigane, secretary-engineer of the Ontario Pulp and Paper Makers' Safety Association and John Haliday of the Beaver Board and Fibre company. Charles Buss, superintendent of the Thorold mill of the Provincial, presided at the gathering.

Following discussion of the subject of training female help for the paper box factories of Ontario, the Toronto Carton club at recent meeting concluded that the matter should be left with each individual manufacturer to work out along his own lines and train his help according to his own methods. All of the paper box making concerns were urged to give special heed to the solution of the problem in order that they may have on hand sufficient trained help to satisfy the demand for paper boxes according to the ebb and flow of demand.

With power to engage in pulp and paper and timber operations Biglow and Malseed, Limited, have been granted an Ontario charter with headquarters at Timmins. The authorized capital of the company is $40,000.

It is announced by the Glengarry Pulp and Paper company, Limited, Cornwall, Ont., that they will shortly install a drum barker and hydraulic pressing equipment. The company, which was recently granted an Ontario charter, has been operating steadily during the past year and they look for a continuing good demand for pulp for home and foreign account.

The pulp and Paper industry is hoping for a sign from Australia that it is willing to grant a preference to Canadian newsprint. As yet nothing has been done that would indicate her attitude, but representatives of the Commonwealth are expected shortly in Ottawa on their way home from the recent Empire conferences at London, and it is understood that her policy will then be disclosed. Canada will ask for the same preference as that now accorded to British paper products.

While the plant of the Nashwaak Pulp and Paper company at St. John, N. B., is closed, general repairs are being made to the machinery and buildings. The machinery repairs was the first work taken over by the new St. John Dry Dock and Shipbuilding company, recently opened at East St. John, N. B.

Hon. Dr. Landry, former provincial treasurer of New Brunswick, in a recent speech, severely criticized the appointment of the Royal Commission on Pulpwood and came out strongly in favor of an embargo on the export of wood from Canada. In support of his contention he contended that statistics showed that only about $10 a cord was left in the province for pulpwood exported as such, whereas if it was made into paper, the benefits which would come to the province would be multiplied. The industries which would result from an embargo against the shipment of pulpwood, would furnish employment for many people and serve to keep the young men who were now leaving the province of New Brunswick.

Hon. T. D. Pattullo, minister of lands, stated recently that plans are now complete for the exhibit of British Columbia forest products at the British Empire exhibition to be held in London next year. This exhibit of B. C. forest products would be a co-operative effort with the lumber, shingle, sash and door, box and veneer manufacturers of the province, and would show to the visitors who would come from all the corners of the British empire exactly what results can be obtained by the use of B. C. forest products.

A well-illustrated brochure on Belgo-Canadian Paper company has been prepared in French. The booklet tells the history of the Belgo company in brief and summarizes the varied career of Hubert Biermans, the vice-president and general manager. Of interest is a discussion of the value to the country of exporting finished paper rather than the raw materials.

Plans whereby the western wheat straw will be utilized for the making of pulp for paper manufacture by a hitherto untried process are being developed, according to M. Dolphus, a prominent banker who visited Winnipeg a few days ago in connection with the project.

In an address before the Canadian Club of Simcoe, Ont., a few days ago, E. J. Zavitz, the provincial forester of Ontario, said that the lumber, pulp and paper industry in Ontario had absorbed a capital investment of $200,000,000, provided employment for 42,000 persons with a payroll of $36,000,000, and produced products valued at $112,000,000 annually. The total export value of these products was $200,000,000 and turned the trade balance of the country in its favor. The forests, too, provided a substantial revenue of $4,000,000.

The town council of Fort Frances, Ont., have voted to submit a by-law to the ratepayers to grant the Backus interests a fixed assessment. The company proposes to increase the capacity of its paper mill from 100 tons to 200 tons per day, and in return asks that for twenty years its various plants, the assessed value of which is $1,280,000, be assesed at $25,000, exclusive of school and local improvement rates.

At a recent meeting of the directors of the Don Valley Paper company, Limited, Toronto, J. F. McKenzie, assistant superintendent, was promoted to be superintendent in place of C. Nelson Gain, who has been appointed general manager of the Canadian Vegetable Parchment company and the Garden City Paper company, St. Catharines and Merritton, Ont. Mr. Gain has moved to St. Catharines where he has taken a house and enters on his new duties at the end of December.

As the failure of Becker & Co., the English pulp and paper house, involved two mills in Great Britain it has rather complicated matters for the Bay Sulphite Co., for which Becker's acted as sales agent in Britain. A portion of its business is with British mills direct and this should not be affected, but that placed through Becker's will have to be made up through the securing of new contracts. It is not thought, however, that this will be a serious difficulty.

Work on the big Kenogami dam in connection with the huge Price development is making satisfactory progress, and it is expected that this work on the upper portion of the Saguenay river will be completed within 18 months. When completed this will enable the Price mills to operate all year round. It is expected that there will soon be important financing in connection with this development in which John B. Duke is interested.

The Stewart-Atkinson Company, operating a lumber mill at St. Romuald, Que., has completed plans for the installation of additional machinery and will embark in the manufacture of pulp and paper. The company intends to employ nearly 1,500 men upon the completion of the present project.

J. D. Robb who recently joined the paper machinery sales department of the Dominion Engineering works, Montreal, was in Toronto last week. Mr. Robb arrived in Canada after having been through the big Japanese earthquake where he lost his home, office and most of his possessions and where both he and his family had a very narrow escape from death.

The death took place in Toronto last week of Mrs. Henrietta Kent, mother of H. F. E. Kent, president of the Canadian Pulp and Paper Association. Deceased was widely known in Toronto and district in connection with philanthrophic and church work.

It was announced in Toronto last week that the new paper bag factory which Kilgour Brothers, Toronto, are erecting at Windsor Mills, Ont., will be ready for operation by the first of the new year, when the paper bag department of the company in Toronto will be moved to the new plant in order to afford room for the company's other activities in the city factory.

New paper enterprises continue to make their appearance. Among the big new ones is the incorporation quite recently of the Steele-Tremblay Paper Limited, with a capitalization of $10,000,000, with headquarters Montreal-Metabetchouan. It is understood that this will have to do with one of the big new developments in Quebec, papers of incorporation having been taken out in that province.

The ground-wood output of the Belgo-Canadian Paper company will be increased through the bringing in recently of two new ground-wood machines, with a capacity of 40 tons a day. It is expected that a portion of the additional output will be used in the Belgo plant. This company has also completed a spur track to its properties for the purpose of bringing in logs by rail.

At the meeting of the Boston Paper Trade association at the Boston City club, Thursday evening, November 22, Rev. Henry H. Crane, D. D., pastor of the Center Methodist church of Malden, Mass., was the principle speaker, telling of business conditions in Japan which he recently visited.

The Baxter Paper Box Co., has remodeled the building which it recently purchased at Freeport, Me., and will open the building for the manufacture of paper boxes early in the December. Machinery is being installed and the company will employ about 50 persons at the start.

Paper and Board

New York, December 18—This is the period of the year when consumers confine their buying of paper to actual and immediate requirements. That is just what they are doing at present. Manufacturers and jobbers in common report a steady demand for most kinds of paper but say that orders call for small lots. No one seems anxious to augment stocks unless having direct need for the paper purchased, as the inventory season is only a matter of a few days off and there is consequently a desire to keep stocks down.

Nevertheless the market is characterized by fair activity. Some kinds of paper are not moving in anything like the volume producers and dealers would like to witness; on the other hand, there is a brisk demand for newsprint, for bag papers and for numerous specialties, while the other basic descriptions of paper, namely writing, book, wrapping, tissue, etc., are moving in ample tonnage to be creative of a moderately lively market.

Sentiment in the trade regarding the new year, which is now so near, is very optimistic, as well as confident. Paper men in general look for 1924 to prove an active period for their industry; certainly there are numerous indications at the moment that their expectations will be realized. The fact that business has slowed down somewhat during the final month of the old year therefore is not disrupting the market. Some shading of prices is being resorted to in an effort to induce buyers to operate, and there have been cases where declines in prices of rather serious proportions have occurred, but below the surface of the market is much fundamental strength which seems to promise better things in due time.

Newsprint continues to move in heavy volume to consuming centers. Publishers have been at the heighth of their season in the past several weeks and have used print paper at a tremendous rate. Not only has consumption by New York publishers been of the record-breaking variety, but throughout the country newspapers have been printing large issues and thus using newsprint in very big amounts. With the price of standard newsprint fixed for the first half of next year, publishers are going ahead in arranging their contracts and are reported to be placing orders for heavy tonnage for the new year.

Easiness still prevails in the wrapping paper market. No further downtrend in quoted prices has been recorded but it is apparent that most transactions are at the lower edge of quotational ranges, and that manufacturers are conceding a good deal to customers in an effort to stimulate demand. No. 1 domestic kraft wrapping is seldom bringing above 6 cents per pound at the mill, or in the vicinity of 6.25 cents f.o.b. New York, and instances are frequently cited where sales have been made at as low as 5.75 cents mill. Quotations on No. 2 domestic kraft range around 5.25 cents at the mill. Imported No. 1 kraft wrapping paper is selling in New York at 6 to 6.25 cents per pound.

A little firmer tone has developed in the box board market. The reason for this is difficult to explain other than a strengthening of prices of raw material entering into the manufacture of boards. It is generally admitted that demand for board of practically all kinds is slow, and some mills are preparing to drastically curtail over the holiday period. Perhaps manufacturers figure on raising the market so that they can secure higher prices for whatever board they succeed

CURRENT MARKETS—Continued

in marketing during the next month—proverbially about the dullest period which the board industry has to contend with in the year. Current quotations on plain chip range around $47.50 per ton f.o.b. New York, and on news board at $52.50 New York, with occasional sales at $45 and $50 per ton respectively reported.

Book papers are holding in price insofar as quotations go but it is no secret that some mills are granting concessions, especially where tonnage orders are concerned. Machine finished book of average quality is fetching around 6.50 cents per pound f.o.b. New York. Fine papers are quotably steady, and while demand is spasmodic, there is fair activity in the market. Bag paper is firm and in good demand. Tissue is moderately active.

Mechanical Pulp

Ground wood is in fairly good demand, according to most reports, and quotations are well maintained. Sellers are rather firm in their price ideas and contend that any changes in the next several months will doubtless be in an upward direction, so that little pressure to sell is now exerted and consumers in a majority of cases find it necessary to meet the rates asked to cover their wants. Domestic producers quote around $40 per ton f.o.b. grinding mills for spruce ground wood for prompt shipment, and about the same price is named for forward shipments. In fact, some manufacturers are inclined to ask more for future shipments than for pulp for current delivery, reflecting their belief that higher market levels will obtain later in the winter. Offerings of imported ground wood are noted at about $38 per ton ex dock New York, with fair quantities available on the spot.

Foreign and Domestic Chemical Pulp

There is little question but that a steadier undertone has developed in chemical wood pulp. Producers and importers express the opinion that prices have finally touched bottom and that a reaction upward is due, particularly since from now on less pulp will become available both in this country and from foreign sources. Late reports from Scandinavia say that some of the pulp mills in northern Sweden have been shut off by the closing of navigation over a part of the Baltic, and that prospects are that waterway will be entirely frozen over in the next few days.

We mean it—

Think of every good thing you would like to have come into your life at this Christmas Season.

Multiply them all at least by two.

And that is the portion we wish for you.

CURRENT MARKETS—Continued

Pulp prices have not advanced but they have hardened. Sellers are no longer cutting asked rates, and the fact that values have steadied is said to have led to increased buying, some consumers having placed orders for fairly large tonnage of both sulphite and kraft. Strong imported unbleached sulphite has sold at around 2.65 cents a pound ex dock New York, and No. 1 Swedish kraft at 2.60 to 2.65 cents on the dock at this port. Quotations on an ex dock basis and f.o.b. pulp mills are:

Domestic Rags

Notwithstanding that some kinds of papermaking material are in slow demand and easing in price, rags display an unusually firm tone. Low grades in particular are tending upward and some further advances have been recorded. Paper mills are granting around 1.70 cents a pound f.o.b. New York for No. 1 roofing stock, and 1.40 cents for No. 2 roofing, while miscellaneous thirds and blues are freely selling at 2.40 to 2.60 cents a pound, depending on the quality of packing, and No. 2 whites at around 4.25 cents New York. New cuttings are wanted in fair amounts and quotations are well maintained, with dealers inclined to ask higher figures for a few grades which are in small supply. No. 1 white shirt cuttings are fetching 13 cents a pound f.o.b. New York, washables 5.25 to 5.50 cents, unbleached muslins 11.25 cents, and blue overall cuttings 8.25 to 8.50 cents. Quotations f.o.b. this city are:

CURRENT MARKETS—Continued

Imported Rags

Sales of dark colored cottons to roofing paper mills at 1.50 to 1.55 cents a pound ex dock New York have been reported, denoting an advance. Other grades of imported rags are in moderate demand at steady prices. Importers lay much stress on the high rates prevailing abroad when negotiating with mill customers, and display little disposition to shade prices. Quotations ex dock New York follow:

Lins., White No. 1	12.00 @ 13.00	German Linen, blue.	3.75 @ 4.00

Bagging, Rope, Etc.

Demand for old rope has subsided to a pronounced degree, most of the important consumers having dropped out of the market as buyers for the time being at least, yet dealers are endeavoring to get the same prices recently prevailing. Domestic No. 1 manila rope is quoted at 6.75 to 7 cents per pound f.o.b. New York, with the probabilities favoring buyers securing some supply at lower prices. Foreign manila rope is quoted at about 6 cents ex dock New York. Old bagging is quiet and unchanged in price. F.o.b. New York prices are:

Gunny, No. 1	1.25 @ 1.40	Wool Tares, light ..	1.25 @ 1.50
Foreign	1.25 @ 1.35	For. Manila Rope..	6.00 @ 6.25
Wool Tares, heavy .	1.50 @ 1.75	Domestic Rope	6.50 @ 7.00
Scrap Bagg. No. 1.	1.15 @ 1.25	Mixed Strings	1.00 @ 1.25
Roofing Bagging ..	.80 @ .90		

Old Paper

After reacting upward following the period of several months of steady decline, the market for old paper is again easy and prices of some grades—principally the low qualities—are on slightly reduced levels. Old folded newspapers are down to 85 cents a hundred pounds f.o.b. New York and there is every probability that some sales have been made at cheaper figures. No. 1 mixed papers have declined to 50@55 cents a hundred pounds, common paper to 40@45 cents, and box board cuttings to 60@65 cents. Shavings are quoted at

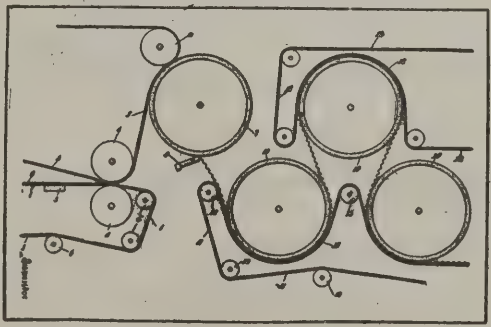
Improved Process of Creping Paper

The Best and Most Profitable

For the manufacture of CREPED PAPER Napkins, Toweling or Stretchable Bag Papers and Creped Packing or Crepe Wrapping Papers the system has no equal



The crepe being formed while the fibres are steaming hot and pliable is dried without stretching; not only retaining form better, but shedding less lint than cold creped paper products.

For particulars address:

Tompkins-Hawley-Fuller Co.

VALATIE, N. Y., or OREGON CITY, ORE.

CURRENT MARKETS—Continued

about previous levels but demand for them is of smaller volume and lower prices seem in prospect. Old magazines are selling at around 1.70 cents a pound f.o.b. New York, with crumpled books quoted at 1.40 cents. A strong item is white blank news, which is held by New York dealers at a minimum of 2.25 cents a pound f.o.b. this city. Quotations are as follows f.o.b. New York:

No. 1 Hard White Shavings	3.85	@	4.10
No. 2 Hard White Shavings	3.25	@	3.50

No. 1 Mixed Papers	.50	@	.55

Twines

Business of steady character is reported in twines but sales are mostly of light volume, reflecting the fact that consumers are buying against immediate needs only. Prices are maintained, and strength in raw material—there having been sharp advances in fibres recently—serves to create firmness at the manufacturing end of the market. Quotations are as follows:

Sisal Hay, pure	13.25	@	14.25
Manila Hay, pure	16.25	@	17.25
Sisal Lath Yarn	12.25	@	13.25

American Light India— No. 6	19.50	@	
No. 7	18.50	@	

Chemicals

Papermaking chemical prices are holding fairly steady.

There is a moderate movement of supplies into consuming channels although buyers as a rule are getting along with contract commitments without having to engage in much new buying.

ORR FELTS and JACKETS

Lowest Cost per Ton

If you judge felt values, not by what you put into the equipment, but what you get out of it—then you will specify ORR 3 stripe Endless Felts for ORR felts will produce the lowest cost per ton. They "stand up" under severe usage. Orr durability is acknowledged everywhere. Their strength and long life are as dependable as their reliability and quality.

In the 32 grades of Felts and Jackets we can match your most exacting demands. Tell us the kind of paper you desire to make, and we will send you samples of felts that will economically serve you and help you to produce paper at lowest cost per ton.

THE PICKLES DRYING REGULATOR

Reasons why you should have it on your machine are: First, it regulates the drying of paper automatically, irregularities are eliminated; second, higher machine finished papers are attainable, because it is possible to maintain the proper quantity of moisture in sheet, as it passes to calenders; third, mills having tried it on one machine have ordered it for all their machines. Full particulars upon application to

Sizing Tests for Paper

Review of Various Methods for Testing for Sizing—Some Results of Experience with Valley Tester

By M. L. Caust
Tileston & Hollingsworth Co., Mattapan, Mass.

AMONG the many kinds of paper made and intended for a great variety of purposes, by far the greater proportion are sized to make them resistant to penetration by liquid of one kind or another. Since it is impracticable to produce a paper wholly impenetrable or waterproof, and since with many kinds of sized papers it is far from desirable to do so, it becomes necessary to determine the amount of permissible absorptivity for any grade of paper, as well as the allowable limits of variation.

This statement of the problem involves methods of testing as well as the adoption of units of measurement to give meaning to a given test. It is the object of this article to discuss the different tests available for the determination of the sizing quality of paper. It seems worth while, however, to state here that as a rule the sizing quality of most grades of paper is not required to remain within narrow limits. A good example of a kind of paper which must not vary too much one way or the other is cheap, lightweight hanging paper. The work of the paperhanger using the cheapest grade of hanging paper must be done as rapidly as possible. On the one hand there must be no waiting for the paper to absorb the paste uniformly, and, on the other hand, the paper must not get wet so rapidly as to become too weak to handle.

One of the first sizing tests originated, and one which is still in vogue and regarded favorably consists in pressing the moist tongue against the paper to be tested. This test, even though esthetically unattractive, is of use in giving quickly a rough idea of the sizing quality of the paper and without the use of external appliances. Its survival in the industry is an indication of the permissible latitudes of sizing fastness for some grades of paper.

Another qualitative test used for writing papers consists of drawing lines or merely writing on the paper with an ordinary pen. If the person trying out the paper is satisfied with its performance then the ultimate user should be, and the paper is therefore passable. Whether the paper is harder sized than is necessary cannot be determined by this test, and keeping sizing costs to a minimum by the result of this test is, therefore, out of the question.

With the advent of the chemist into the paper mill, sizing tests were devised capable of numerical expression, which was a big step forward. If the sizing fastness of paper expressed by a number does not allow comparing different grades or weights of paper it, at least, tells which of two papers of the same kind may be better sized and by how much. Except for the attempt by Carson[1] to relate sizing tests on different grades of paper, all tests that have been proposed aim only at a comparative sizing of the paper tested.

As to the methods of testing for sizing in common use an idea can be obtained from the paper by Carson. He sent out a number of samples to be rated for sizing quality and the laboratories reporting used: *(a)* Flotation on ink and acid; *(b)* electric conductance; *(c)* the Stockigt method, and *(d)* pen and ink test.

These tests will be described here as well as several others which are useful.

Flotation Test. A small piece of the paper to be tested is dropped on a suitable liquid and the number of seconds or minutes it takes for the liquid to show through are counted. The necessary precautions are close control of the temperature of the liquid as well as guarding against a change in the composition of the liquid, especially ink, through evaporation. It is stated that at different air humidities tests will not check owing to the difference in vapor tension of the liquid used and because of the changed moisture content of the paper. The usefulness of the flotation test is therefore limited to the comparison of samples of the same kind of paper tested at the same time. For any repetition of the sizing test on a paper, control of temperature and humidity conditions must be available. If such control is possible, and in most laboratories it is not, then the flotation test is probably as accurate as any of the other methods in the hands of one observer. It is commonly held that it makes a difference whether the wire side or the felt side of the paper is next to the liquid, but the author had occasion to test a paper which was distinctly better sized on the felt side, and yet the results were the same no matter which side of the paper was in contact with the liquid.

The Herzberg Method is suitable for writing papers. Lines of increasing width are made on the paper with a drawing pen held at constant angle and moved over the paper at the same rate until the ink just shows through on the other side. The width of the critical line is then measured and represents the sizing test of the paper. This test, besides being limited to a few grades of paper, is too slow for mill control work. Moreover, it is averred that two lines of the same width drawn with a pen may not have the same amount of ink per unit area and the results are affected thereby.

The Stockigt Method[2] is an improvement on the flotation method in that it serves to fix the end point of penetration of liquid through the paper and thus limits any personal equation error. This is accomplished by the use of a 2 percent solution of ammonium thiocyanate on which to float the paper, while a 1 percent solution of ferric chloride is brushed on the top surface of the paper sample. As soon as the two solutions meet the red of ferric thiocyanate appears and the time elapsed from the dropping of the paper on the thiocyanate solution until the red color appears is noted. The author gives data to show that this method gives results agreeing with those obtained by the Herzberg inkstroke test.

The Curl Method[1] makes use of the familiar phenomenon of curling of a piece of paper when dropped on a liquid due to expansion of the wet side. Curling stops when the liquid is halfway through and the upper half of the paper sample begins to expand. It is claimed for this method: "Definite and dependable data, a numerical value for relative sizing quality, a simple apparatus and a shorter time required for a test." No reports have so far appeared on the applicability of the curl test in the mill laboratory.

The Electrolytic Method. The use of an electrically conductive liquid for permeating a sample of paper tested while the paper is part of an electric circuit, and measurement of the gradually diminishing electrical resistance of the paper as it is being saturated with the liquid, are the essential features of the electrolytic method for testing sizing fastness which was first suggested by Okell[3]. Several investigators have since employed this method and have reported their observations. However, as the arrangement was different in every case results were not comparable.

At present the Valley Size Tester, built by the Valley Iron Works Company, is available and has been used by the writer for two years. While one can draw curves of decreasing resistance of the paper whose sizing fastness is being determined to compare with curves similarly derived for other papers, it is found simpler for mill control work to take the time elapsed from the bringing of the electrolyte in contact with the paper to the point where the milliammeter of the instrument registers the passage of a suitable current as the sizing value of the paper. The sizing quality of the paper is thus expressed in seconds or minutes. It is evident that the penetrability of the electrolyte is dependant upon its viscosity. By changing the proportion of glycerin and salt solution the viscosity can be adjusted to suit the kind of paper tested. However, the writer has used the same electrolyte and has adhered to the same milliammeter reading for a variety of papers ranging from light-weight slack-sized book paper to tub-sized index card paper and has thus avoided introducing complications into the meaning of the test.

As has been shown[4], the average variation of tests on book papers and writing papers is about 10 percent. This value was found true for practically all of the papers tested and is probably due to the paper rather than to the method of test, since the same papers tested by the flotation method show about the same variation. Alexander[5] found that on butcher's wrappers the Valley tests are strongly influenced by the formation of the sheet.

The elimination of the personal error is what commends the Valley method over all the other methods of test. The confidence of the experimenter in his results encourages him to find the significance and meaning of the sizing test, and to try correlating the sizing value for one paper with that for another.

In the accompanying graph (Fig. 1) the Curve represents an attempt to find the effect of weight upon the sizing test. It is a matter of practical importance in the manufacture of paper to be able to say in advance whether a certain furnish of stock and size will give the desired sizing fastness for a given weight from results obtained with lighter or heavier paper of the same grade. After a number of curves have been obtained from runs in the mill it should be safe to predict whether the size in the furnish must be increased or decreased to get certain results, while costs are kept down to a minimum.

Figure One

For research work a scientific instrument for testing sizing quality was wanting. The recently published article by Zhereboff comes to mind. It was found[6] that the different rays of sunlight did not equally affect the sizing in paper. The violet, blue and yellow rays destroyed the sizing more rapidly than did the other rays, but the author was not able to classify the rays any better than into two groups, the Herzberg test not allowing the detection of small differences in sizing fastness.

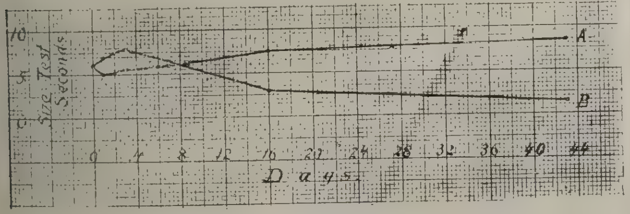

Figure Two

In Fig. 2 is shown the effect of a few hours of direct sunlight daily on the sizing of paper. A part of the same sheet of paper was kept in the lark and tests were made occasionally with the results as shown by Curve B.

It is seen on the curve that sizing of the paper kept in the dark gradually improved. This agrees with the data given by the author in a previous article[4] for other kinds of paper, and has been found to hold true as a general rule. If this is so, how does this affect the importance of testing the sizing quality of paper soon after it is made? For control work the chemist must, of course, test the paper as it is being made.

When a sample of paper must be matched for sizing, how is one to tell whether the sample is not testing now several times what it did as it came from the machines? Is it possible to determine what the original sizing test was? What are the conditions under which samples of paper must be kept to maintain original sizing quality? These are questions which must be answered if the Valley tester is to take its rank as a useful scientific instrument for paper testing.

Lagerloef Sues Western Company

Suit to collect $72,347.52 from the American Paper Products Company, of Indiana and the St. Louis Union Trust Company was filed in the Circuit Court, city of St. Louis, Mo., Dec. 11 by the Lagerloef Trading company, Inc.

It is charged in the suit that the Finnish Cellulose Association, predecessors of the Lagerloef Company, entered into two contracts with the American Paper Products Company, which was engaged in the manufacture of cardboard and paper products under the name of the Carthage Board & Paper Company, on August 5, 1920, for a large amount of pulp. Later, it is set forth, the name of the company was changed to the American Paper Products Company of Indiana.

At the time the pulp was delivered, it is claimed, the market price for pulp declined and the defendants repudiated their contracts and the plaintiff company sustained a loss of of approximately $72,000. The rights of the Finnish company were later acquired by the plaintiff. Suit was filed against the American Paper Products Company of Indiana. Judgment was rendered against the defendants and an appeal was taken to the United States District Court of Appeals. This court directed judgment be entered against the defendants. Demand for payment of the judgment was made, it is set forth, but was refused.

The petition now filed charges that in May, 1922, the Indiana corporation entered an agreement by which the assets of that company were to be transferred to the Missouri corporation. The assets of the Indiana corporation, it is said, amounted to $500,000. It is alleged that the agreement set forth that after receiving the interests of the Indiana company, the Missouri company was to place a mortgage on all of its combined properties. This conveyance, it is charged, was made to the St. Louis Union Trust Company, which was named trustee for the purpose of securing the issuance of bonds. It is further alleged that this action was taken to defraud the plaintiff as a creditor. The petition states that after making this transfer, it left no assets of the Indiana corporation out of which any execution could be levied.

The plaintiff asks that the transfer of the assets of the Indiana corporaion be adjudged fraudulent and that the American Paper Company be compelled to account for all assets and property from the Indiana corporation.

New Link-Belt Calendar

Following established practice of the past several years, Link-Belt Company of Chicago has again issued a calendar for the ensuing year. In general style the 1924 calendar adheres closely to those issued in the past. Sixteen by twenty-four inches in size, each of the twelve sheets contains not only a large monthly calendar, plainly and legibly printed, but also, in smaller size, the months preceding and following.

The illustrations, however, show a marked improvement over the calendars of previous years. They are from the justly celebrated Chicago artist, Jeffery Grant, and while they accurately portray the construction features of the various types of Link-Belt equipment shown, they have an artistic touch unusual to mechanical subjects.

Some Sulphite Mill Calculations

A Collection of Formulas and Graphs Which Will Assist in Designing Apparatus or Calculating Results of Tests

Compiled by W. B. VanArsdel, Research Dept., Brown Company

Part I. Conversion Factors. Slide Rule Accuracy

Length—
1 inch = 2.54 cm.
1 meter = 39.37 inches
1 kilometer = 0.621 mile

Area—
1 sq. inch = 6.45 sq. cm.
1 sq. mm. = 1975 circular mils

Cubic Contents—
1 cu. ft. = 28.32 liters
1 cu. ft. = 7.48 gallons
1 gallon = 3.785 liters
1 liter = 1.057 quarts
1 cu. inch = 16.39 cc.
1 fluid oz. = 29.57 cc.

Weight—
1 pound = 453.6 grams
1 pound (av.) = 7000 grains
1 kg. = 2.205 pounds
1 oz. = 28.35 grams
1 gram = 15.43 grains
1 cu. ft. water = 62.4 pounds
1 gallon water = 8.33 pounds

Velocity—
1 ft. per sec. = 30.48 cm. per sec.
1 mi. per hr. = 0.447 meters per sec.

Pressure—
1 lb. per sq. in. = 2.036 in. mercury, 15°C.
1 lb. per sq. in. = 2.309 ft. water, 15°C.
1 lb. per sq. in. = 51.7 mm. mercury, 15°C.
1 atmosphere = 29.92 in. mercury, 0°C.
1 atmosphere = 14.70 lbs. per sq. in.
1 in. water = 67.85 ft. air, 15° C., 1 atmos.
1 in. mercury=923 ft. air, 15° C., 1 atmos.
1 in. water = 0.036 lbs. per sq. in.
1 in. mercury = 0.491 lbs. per sq. in.
1 kg. per sq. cm. = 14.22 lbs. per sq. in.
1 megabar per sq. cm. = 14.50 lbs. per sq. in.

Gas Volumes—
1 cu. ft. per lb. = 0.0624 liters per gram
At press. 760 mm. or 29.92 inches, 22.4 liters at 0°C. or 24.0 liters at 20°C. weigh M grams; 22.4 cu. ft. at 0°C. or 24.0 cu. ft. at 20°C. weigh M ounces, where M = molecular weight.
1 pound-mol. at 0°, 760 mm. = 359 cu. ft.
In equation PV = RT,
R = .08024 when P = atmos., V = liters per gram-mol. and T = °C. absolute.
R = 0.730 when P = atmos., V = cu. ft. per lb.-mol. and T = °F. absolute.

Temperature—
T absolute = °C. + 273.1
T absolute = °F. + 459.6
Temp. °C. = (°F. - 32) /1.8
Temp. -F. = (°C. x 1.8) + 32

Heat—
1 B.T.U. = 778 ft.-lbs.
1 B.T.U. = 252 calories
1 Kg.-cal. = 3.97 B.T.U.
1 cal. per gram = 1.8 B.T.U. per lb.
1 B.T.U. = 1054 watt-seconds
= 0.293 watt-hours
1 kg.-cal. = 4186 watt-seconds
1 Boiler Horse-power = 33,480 B.T.U. per hr.
1 KW.-hr. = 3415 B.T.U.
1 KW.-hr. = 861 Kg.-cal.
1 H.P.-hr. = 2547 B.T.U.
1 H.P.-year = 6540 KW.-hrs.
1 watt-second = 0.239 cal.
1 ton refrigeration = 288,000 B.T.U. per day
= 200 B.T.U. per min.

Power—
1 KW. = 1.341 H.P.
1 H.P. = 746 watts
1 H.P. = 33,000 ft.-lbs. per min.
1 metric H.P. = 0.986 H.P.
Pumping 1 gall. water per min. against 1 lb. per sq. in. pressure requires 0.000581 H.P.
1 cu. ft. of water per sec. falling 1 ft. = 0.1135 H.P.

Density—
Liquids heavier than water:
Deg. Baume′ = 145 –(145/sp. grav. 60° F.)
Sp. grav. 60° F.=145 / (145 - Deg. Bé)
Liquids lighter than water:
Deg. Baume′ = (140/ sp. grav. 60° F.) – 130
Sq. grav. 60° F. = 140/ (130 + Deg. Be′)

Electrochemistry—
1 gram – equivalent is liberated by 96,540 coulombs.
1 amp.-hr. liberates 0.0373 of one gram-equiv.
1 lb.-equiv. is liberated by 12,160 amp.-hrs.

Constants—
$\text{Log}_0 \times = 2.303 \ \text{Log}_{10} \times \quad \sqrt{2g} = 8.025$
Sulphur dioxide, 0°C., 760 mm.
2.927 grams per liter
5.475 cubic feet per pound
Chlorine, 0°C., 760 mm.
3.220 grams per liter
4.980 cubic feet per pound
Carbon dioxide, 0°C., 760 mm.
1.977 grams per liter
8.11 cubic feet per pound

Testimonial to Dickenson

Walter Dickenson, who for the past twenty years has been connected with Brown Brothers, Limited, Toronto, and for the past ten years in charge of the paper and business supplies department, has resigned his position and has joined forces with B. G. Whitelaw. The firm will be known as Whitelaw, Dickenson & Company. They have taken over the manufacturers' agency business of the late Aubrey Hurst, Ellis Building, Adelaide Street, Toronto, who for many years have represented a number of leading British paper houses.

Mr. Dickenson for some years was a member of the Mills Relationship Committee of the Canadian Paper Trade Association from which he has now resigned. This occasion, and that of his new enterprise was made the occasion of an interesting little gathering of his associates in the Toronto paper trade a few days ago when Mr. Dickenson was presented with a gold watch.

Treatment of Spent Soda Liquor

Washing, Evaporation and Burning the Liquor for Recovery of Soda—Leaching the Black Ash, Causticizing the Carbonate Liquor and Disposing of Lime Sludge

By G. K. Spence

New York and Pennsylvania Company, Johnsonburg, Pa.

THE first liquor draining from the stock after it is discharged from the digester tests about 12° Be' at 60° F. This liquor is made up principally of soluble sodium salts of the organic acids removed from the wood, and at the strength named is equivalent to .95 lb. of 48 percent soda per gallon.

In the past the washing has been done either by the diffusion system or in open pans. Owing to the fact that the stock is washed under pressure in the diffusion system, it has a tendency to pack hard and wash in channels, which accounts for the limited use of this system. The open pans are in general use at the present time for washing stock, which is carried on by direct washing or by the cycle system. The cycle system gives the best results, as it furnishes stronger liquor for the evaporators and reduces the amount of soda sent to the sewer in the wash water. Washing brown stock in open pans has been described by the writer in a paper read before the Technical Association of the Pulp and Paper Industry at the fall meeting in Chicago, September 25, 1919, and published in PAPER for October 15, 1919.

There have been some decidedly progressive steps taken during the past four years along the line of washing spent liquor from brown stock. During the Chemical Exposition in Chicago, in September, 1919 the writer had a talk with Mr. Morrison of the Oliver Continuous Filter Company on the possibility of using continuous filters for washing the black liquor from soda pulp. This company got busy at once and while they have met with many obstacles while working out this problem, they have succeeded in overcoming them and are now in a position to put in a continuous filter installation which will produce results that cannot be duplicated by pan washing. Among the installations which are at present working successfully are the ones located at the Champion International plant, Lawrence, Mass.; the Ford pulp mill at Detroit, the Oxford pulp and paper mill at Rumford, Maine.

W. D. Mount, who is also working on the continuous filter system of washing brown stock, avers that his company has developed the method of handling the stock to such an extent that a 2 percent consistence stock can be handled perfectly, while it is for the Oliver system that best results are obtained by the use of a 1 percent consistence stock.

In this age of high consistence bleaching, the stock as it is doctored from the continuous filter is at the proper consistence for bleaching, if dropped direct into a bleacher; but at present it is necessary to dilute it again in order to screen the stock before bleaching. This appears to be lost motion and if a system could be devised by which the stock could be screened while at a 1 percent consistence and before passing over the continuous filter, it would be a great improvement. This idea has been brought to the attention of Mr. Morrison and Mr. Mount, and the method will be perfected if there is any possible way of doing so.

By use of the continuous filter it is claimed, and the claim has been substantiated, that there is only a drop of 1° Be', in the strength of the liquor caused by the wash water. This means that the liquor going to the evaporators will test 11° Be' at 60° F. Another reasonable claim is that the liquor will be free from stock, and thus obviate the necessity of filtering.

The Elmore continuous centrifugal machine has been tried out experimentally for removal of black liquor from brown stock, with promising results. If the manufacturer of this machine and the pulp manufacturer cooperate on the development of this problem, there is no question but that it can be worked out successfully, provided the power cost will not be too high. The results of experimental trials with this machine are embodied in a report submitted at the sectional meeting of the Soda Pulp Committee in New York, April 12, 1922, and published at that time.

Emil E. Lungwitz is advocating the use of the Haubold self-unloading centrifuge for the above mentioned purpose. He is willing to demonstrate the efficiency of this machine to any one interested, and it no doubt has possibilities.

There is no system of pan washing so perfect that there will not be some stock washed through the bottom of the pan. This stock must be removed before passing the liquor to the evaporators, in order to get the proper efficiency from the machines. The writer has found the stock in this liquor to vary from 700 pounds to 1,200 pounds, when handling 350,000 gallons of weak liquor in twenty-four hours. An efficient filter will reduce this stock content to 15 lb. in twenty-four hours, when handling this amount of liquor.

Liquor Should be Measured

It is advisable to install a Venturi-meter to measure all liquor sent to the evaporators. This measurement, together with an average strength test of the liquor, will give a good check on the amount of soda handled by the machines, and the relative efficiency of it. In the evaporators the weak liquor which tests from 9° Be' to 10° Be' is concentrated to about 37° Be' before it is sent to the rotary incinerators.

Evaporation of spent liquor was thoroughly reviewed in a paper submitted by the writer at the annual meeting of the Technical Association in New York, April 11, 1923, and published in the trade papers.

In order to send hot liquor to the rotaries it is advisable to stagger the flow of liquor in the evaporators; that is, to feed the weak liquor in the second effect; flow from the second to the third effect and finish in the first, or steamheated effect. It is also advisable to pipe the liquor from the evaporators direct to the rotaries, and have the piping so arranged that any excess liquor backs up into the rotary liquor storage tank, and when the supply of liquor from the evaporators is not sufficient it is made up from the storage tank. In this way the rotaries are supplied with the hottest liquor.

Rotary Incinerators

The rotaries should be provided with sight feeds so that one may be able to tell at all times the amount of liquor being fed to them. The tendency in recent years has been to increase the length of rotaries, and at the present time there are a number of 30-foot rotary installations. It is a mistake to increase the length of a rotary and not increase its diameter, as this makes it necessary to speed up the gases passing through the rotary and flue, and results in the loss of more ash up the stack. (The subject of "Rotary Room Problems" was presented in a paper by the writer before the Technical Association, February 5, 1919, and published in the Convention number of PAPER, February 12, 1919.) The black ash from the rotaries contains about 77 percent sodium carbonate.

Many attempts have been made to recover the black ash from the stack gases. It has been tried in a wet way by spraying the gases passing up the stack with water or weak liquor, but has not proved successful, owing to the fact that the material reclaimed forms a dirty conglomerate mass difficult to handle. It is too dirty to send to the leachers, not strong enough to burn without previous evaporation, and contains too much suspended solid matter to send to the evaporators.

The B. F. Sturdevant Company, under the personal supervision of G. C. Derry, a member of T.A.P.P.I., has done considerable experimenting with a fan separator for recovering black ash from the rotary stack gases. They have met with fair success in an experimental way but have not, as yet, made any practical installations.

The Research Corporation has been following up the proposition for several years and made considerable improvement recently in the Cottrell precipitation process for the recovery of black ash from the stack gases. They are now in a position to guarantee results to be obtained with such an installation, and it is the opinion of the writer that the time is not far distant when some of the large soda pulp mills will have Cottrell electric precipitators installed for this purpose.

The advantage to be derived from steam boiler installation at the back of rotary incinerators to utilize the waste heat from them is questionable. When using long rotaries the temperature of the waste flue gases does not exceed 450° F., and this heat can be better utilized for heating water. Heating tubes can be arranged in a chamber behind the rotaries for the circulation of water from a hot water tank, but these tubes must be easily accessable so they can be cleaned from time to time.

Research on Recovery of Waste Products

Regardless of the extensive amount of research work carried on during the past seven or eight years, we are still burning up the wood alcohol, acetone and other valuable products in spent liquor which are recoverable but not as yet on a paying commercial basis.

In 1912 the writer examined blow-off liquor from soda pulp digesters and found it to contain wood alcohol and acetone, but the quantity present was so small that its recovery was not a paying proposition.

In 1914 Prof. Alfred H. White brought to the writer's attention the possibility of recovering wood alcohol and acetone in paying quantities from the spent soda liquor by destructive distillation before recovering the soda present. In conjunction with him an extensive line of research was conducted on this important subject. Both rectangular and cylindrical verticle retorts were tried without success, the principal trouble being that the liquor would pass too rapidly through the retorts, regardless of the speed at which they were fed, and reach the door at the bottom of the retort before the destructive distillation was complete. An inclined cylindrical retort showed enough promise to warrant trying out a 24-retort semicommercial unit. This installation was fully described by Professor in a paper presented at the annual meeting of the Technical Association, February 7, 1917, and published in PAPER, vol. xix, page 23.

The results of experiments with this semicommercial unit showed that for each cord of wood cooked six gallons of wood alcohol and .9 gallon of acetone could be recovered. While working on the distillate it was discovered that ammonia could be recovered in paying quantities if this process could be worked on a commercial basis. However, the fuel and labor cost was much too high to make this idea commercially successful and it was therefore abandoned.

In 1919 experiments were continued, and varying amounts of quicklime was mixed with the liquor before retorting it. These experiments were conducted in a small experimental way and also in rotary retorts used for retorting acetate of lime. The addition of lime increased the proportion of acetone to methyl alcohol, but there was no apparent improvement in the ultimate results.

Dr. Drewson had carried on a similar line of experiments, and as lime increased the percentage of acetone, this method of treatment was adopted. The U. S. government being in urgent need of acetone, was sufficiently impressed with Dr. Drewson's idea to install three large plants at a cost of millions of dollars for the recovery of methyl alcohol and acetone from spent soda liquor. Only one of these plants was operated and that one for a very short time, when the armistice was signed. Knowing the cost of production to be much higher than the value of the product, these plants were at once scrapped when there was no further call for acetone at any price.

While searching the patent files during this research work the writer found specifications for a patent granted to Hayden M. Baker, of Rochester, N. Y., dated April 24, 1866, which covered all phases of the destructive distillation of spent soda liquor even to the addition of quicklime to the liquor. It seems, however, that after Mr. Baker's work very little was done toward developing the idea for almost half a century. This problem is far from being solved, but it offers great possibilities and should be followed up by those who are in a position to do so.

Leachers

The gravity and pressure leachers are still in use for washing the soda from the black ash. These systems, while answering the purpose fairly well, have their disadvantages. The results are not entirely positive as there is a tendency to leach in channels and to incompletely wash hard lumps. The system suggested by Mr. Trostel, if perfected, would have a tendency to eliminate the possibility of having unwashed ash. In this system the ash is passed through a crusher and washed on continuous filters, the filters working in tandem. Weak liquor is used on the first and water on the second. This method of washing was fully described by Mr. Trostel in a paper presented at the annual meeting of the Technical Association, April 15, 1920, and published in PAPER, April 21, 1920.

Disposal of Leached Black Ash

While some of this ash has dried, ground and treated for various purposes, a very small proportion of it has found a market at the present time.

It has been tried out with some success for case-hardening; has been used in limited quantities as an adulterant for blacks used for various purposes; has been briquetted for fuel; and after special treatment has been used with some success as a filtering and decolorizing medium.

The cost of drying the leached ash has rendered its value as a fuel prohibitive. It acts very much like a sponge and when drained will contain 80 percent moisture.

Wheeler & Woodruff and others, who have studied this carbon, advocate the necessity of activating it before considering its use as a decolorizing agent. The Industrial Chemical Company, after years of research with a large technical staff, has succeeded in marketing a very limited quantity of this black ash, specially treated and sold under the trade names of Filchar, Nuchar, etc.

However, when all is said, the market is so limited and the quantity produced so large that there will have to be new uses developed for it before the field of disposal will be large enough to make it a paying proposition to recover this ash.

Causticizing the Carbonate Liquor

The pan, batch, causticizing system is still in use in the great majority of soda pulp mills, but these installations are generally supplemented with some form of filter for washing the liquor from the sludge after causticizing it.

By the old system after decanting the strong liquor the lime sludge was given three or four washes by decantation, depending upon the capacity of the alkali room. When using a filter press in connection with the alkali room it is only necessary to give one wash by decantation, and then wash the sludge to the filter where the washing is completed with a comparatively small quantity of wash water. This additional installation has increased the capacity of the alkali room 100 percent, and cut the loss of soda in this department, which at times was as much as 3 percent, to about .2 percent.

The filters are either batch, as represented by the Kelly press, or continuous, as represented by the Oliver, Mount, and Industrial. When reclaiming the lime it is advisable to use the continuous type; but when used only as a means of increasing the capacity of the alkali room and cutting down the loss of soda in the sludge dumps, it is the opinion of the writer that more uniform results can be obtained by use of the batch type.

The W. D. Mount continuous causticizing system has been installed in several soda pulp mills and from all reports is giving very good satisfaction. It is compact and requires much less floor space than the ordinary batch system.

The Dorr counter-flow system has been tried out in one soda pulp mill, but on account of the great amount of space necessary to furnish the required amount of liquor, it has not appealed very strongly to the soda pulp manufacturer.

Disposal of Lime Sludge

When compelled to avoid dumping lime sludge into the stream, the pulp manufacturer has been forced to study out some means of disposing of this sludge. The first step was to consider sedimentation basins and a number of pulp manufacturers resorted to this means of disposal. This is an expensive method of disposal as it requires a large area of land, which might be used for other purposes.

After the introduction of the filter press it was decided that the cake from the press being in a semi-dried condition (containing from 40 to 50 percent moisture) it might prove profitable to dry this lime and market it for agricultural purposes, or clean it up, spend the calcium hydrate in CO_2 towers and market it as whiting. A number of large installations were made for this twofold purpose. As long as the whiting and agricultural lime market could absorb this product it was about a break-even proposition; but as this was only seasonable the result was that there were times when it was necessary to resort to the old methods of disposal, being impossible to store the quantity produced. In addition, storing meant rehandling, and rehandling meant a loss.

The next step was to consider reburning and using the reclaimed lime for causticizing purpose, which meant a stable outlet for the reclaimed lime. This has been considered by pulp manufacturers who have studied the proposition from all angles to be the most feasible method of handling the situation. In fact about all of the original agricultural lime and whiting plants in soda pulp mills have been converted into lime reburning plants. By this method there is a slight margin of profit and the pulp manufacturer is his own stable market for the disposal of the reclaimed lime.

Beauty in Paper Machine Design

IT is good and pleasing to refresh our memory from time to time with the pioneer work of early American engineers and paper machine designers. This thought is prompted by the appearance in the November issue of *The Super-Calender,* of The Pusey & Jones Company, of a tribute to the artistic bent of the late Thomas H. Savery, Sr., who was the founder of the Pusey & Jones Company. It may be noted parenthetically that the traditions of the elder Savery are being carried on in a worthy fashion by his son, Thomas H. Savery, Jr., of Chicago, through his connection with the Nash Engineering Company.

It is presumably Vincent G. Hazard, field engineer of The Pusey & Jones Company who writes so appreciately of the influence exerted by Mr. Savery in the artistic design of papermaking machinery, for Mr. Hazard is himself a veteran in the service of the firm, who loves to recall the incidents of his early association with the founders of his firm.

Taking for his text the heading of an article in the *American Machinist* for September 27, 1923, entitled "Is Beauty an Important Factor in Machine Design?" the writer in *The Super-Calender* dilates on Mr. Savery's attainments and ability in the designing and construction of papermaking machinery. He declares that an experience of thirty years under the influence and tuition of Mr. Savery compels him to reply, in answer to the question contained in the title just quoted, "Yes, beauty is an important factor." He then proceeds to give some reminiscences of his early associations with Thomas H. Savery, Sr., as follows:

"The late Mr. Thomas H. Savery is considered by many people to have been the father of the American Paper Machine, that is, through himself and through the influence which he exerted over those around him, the greatest mechanically of the paper machine, and of its productive ability were more largely carried out than by the efforts of any other person.

"We have told the story before in *The Super-Calender* (see the issue of April, 1912) of how The Pusey and Jones Company, came to build their first two paper machines in 1867, for the Rockland mill of Jessup & Moore Paper Company, followed as years went on by the construction of many others. The writer entered their drawing room in 1877 when three paper machines were under construction, Nos. 10-11-12, for the Augustine mill of the same company, following a fire. For about thirty years he continued making designs under Mr. Savery, for almost every piece of apparatus used in a paper mill, and he should be therefore well qualified to speak of Mr. Savery's attainments and ability in designing and constructing machinery. One of Mr. Savery's first points when having the frame of a machine laid out, was to see that it should be pleasing to the eye as well as be fitted for its duty mechanically. He was very quick with his own pencil, and he could hardly talk ten minutes without requiring a piece of blank paper on which he continually made sketches illustrating his verbal directions. The draftsman of course followed out the design to scale on the drawing board, and often he had done so successfully, but on Mr. Savery's next visit to the drawing room, he would look for a few minutes at the design, then shake his head slowly, and say—'Now can't we make this a little more pleasing to the eye by shaving off a little bump or fatness here, and filling out just a little there,' and always the result was immediately recognized as being very much better.

"He held in great contempt what he called 'dry-goods-box design,' straight lines, square corners, no fillets, and he said, 'It doesn't cost very much more to make a pattern of pleasing appearance, than it does one of great crudity, but the effect ever after is vastly better.' He was not at all in favor of fancy gingerbread work, and even the painting of his machinery was very modest and relieved only by striping, until in 1883 the five-leaved rosette was adopted, which was cast on all castiron work, and brought out more plainly to sight by being painted with aluminum.

"The arms of pulley patterns were made straight and appropriately tapered instead of being made of uniform section and double curved like the letter 'S' which was a style much affected at that time. This kind of pleasing design was well carried out by the then foreman of the pattern shop, William Walker, who also had an instinctive and innate sense of beauty and appropriateness. He one day said to the writer, 'fillets should in many cases not be made circular in shape by a compass, but should be tapered back with a very long gradually decreasing curvature, that is so much more pleasing to the eye than the usual draftsman's compass fillet. Thus the fillet by which the arm of a pulley is connected to the rim should begin some 3", 4" or 5" up on the arm, gradually swelling the sectional area of it, and more sharply swelling out into its juncture with the rim.' 'Why,' Mr. Walker continued, 'you won't find the branch of a tree joined to the trunk by a radius fillet.'

"A customer once said to him, 'Why, Mr. Savery, your prices are the highest, and we find by looking around there are other builders of paper machinery who build a substantial machine. In fact we have just come from a builder who put 5" journals on his breast rolls,' and Mr. Savery jumped and snapped out, 'I wish they would make then 10", there would be no surer way to kill their machine. We make the journals of our breast rolls small in diameter, but obtain the proper amount of bearing surface by making them long. The fourdrinier wire must drive the breast roll, and the more friction on the journals the shorter the life of the wire. You say our prices are the highest, that is another reason why you should buy our machines, because no one can consistently and continually go before the world and obtain the highest prices without there being some valuable reason and compensation for obtaining such high prices.'

Forestry in the Paper Industry

Conducted by J. R. Simmons, Secretary Forester,
The New York State Forestry Association

Southern Forestry Conference

Important Meeting at New Orleans Voices Southern View on Necessity for State and Federal Aid

An epochal conference, in its probable result on the development of the South, was held at New Orleans late in November. It was known as the Forestry, Reclamation and Home Making Conference, and the discussions which it inspired received only the slightest mention in the northern press. Such speakers as Secretary Wallace of the Department of Agriculture, United States Senators Ransdell and McNary, and Henry Hardtner, the pioneer in southern reforestation, discussed the general subject, and the sentiment on the four day conference was as follows, as expressed in the resolutions on forestry:

"The area of cut-over land, especially in the South, is rapidly increasing and without adequate provision being made for its reforestation or other use.

"All of this land has some value for future forest growth; it can be a source of wealth to the community if properly protected from fire and controlled in such way as to encourage reforestation.

"A considerable portion of lands formerly in forest and which have been denuded has greater value for grazing than for forest growth; such lands should be utilized for grazing.

"Within or adjacent to these forested, cut-over, or grazing areas are relatively small tracts of land, with soil and other conditions favorable for cultivation; such areas should be devoted to the making of small self-supporting farm homes whenever the need arises.

"The continued utilization of those farm lands and the permanence of the small farm homes which may be established on them is largely dependent upon the proper control and protection of the grazing and upon the systematic utilization of the forest products.

"Resolved: That we advocate a systematic study of all timbered, cut-over or waste lands with a view of determining the best use of these for growing timber, grazing and agriculture, also the adoption of a national policy leading to co-operation with reclamation districts, formed under state laws, to bring about the use of feasible farm lands within or adjacent to the cut-over land and the creation of opportunities on these for farm homes as rapidly as they may be needed.

"America's forest resources are being steadily depleted and we recognize the necessity of making plans without further delay for timber production in order to insure a permanent and adequate timber supply for the nation.

"Every proper encouragement should be given to all efforts wisely aimed at elimination of waste and conservation of forest resources in their utilization.

"If proper forestry methods are practiced on a sufficient area of forest lands the problems of timber shortage in the United States can be greatly alleviated.

"In most regions the problem is of a size and character removing it from the possibility of solution by individuals, unaided by the federal and state governments. Federal and state forests should be extended and legislation should be enacted which will encourage the production of timber by individuals.

"It is universally recognized that at least 75 per cent of the problem of regrowth is fire protection. Immediate steps should be taken to extend co-operation between the federal and state governments and individual owners. Public indifference and carelessness, as well as deliberate acts of individuals contribute greatly to the fire hazard.

"Protection should be afforded to the forests wherever practicable, not only from fire, but also from the spread of insects and preventable disease.

"Present tax laws in most states make private reforestation impracticable. Such changes should be made by the various states in laws relating to taxation of forest property, as will permit and promote private reforestation.

"If adequate reforestation plans are commenced now practical reforestation will reach a point sufficient to assure an adequate, permanent supply of timber for saw purposes before the present supply of standing timber is exhausted.

"Federal and state regulation in forestry should not extend to the impairment of the right of property in privately owned timber lands.

"Resolved: That the federal and state governments be urged to make sufficient appropriations and give adequate co-operation and assistance to private owners for prevention and suppressions of forest fires and afford all possible protection against pests and tree diseases; that the area of all public forests be greatly extended through the acquisition of federal and state owned forests for regrowth of timber and for demonstrating the practical benefits of forestry methods, and that the state and federal governments study and devise just and practicable laws for taxation of forest property so as to encourage and permit participation in timber production."

Running through all of the forestry statements that come out of the southern pine-growing states we detect a viewpoint that is not evident in the paper-making regions, and as the lines become closer drawn on forestry there may be expected a still further difference between the attitude of the paper men and the lumbermen. The lumbermen are showing an increasing tendency toward dependence on the government and state forests for future material, while the paper industry is recognized by the lumbermen as being close to the point where it can practice forestry economically. Only sane tax laws to encourage the growing of forests can change this attitude on the part of the lumbermen, and modify their belief that trees can not be grown for lumber uses by private enterprise.

Facts from School of Experience

Forestry possibilities in the middle west, lake states and the south have figured in reports made to the Woodlands section of the American Paper and Pulp association.

Karl Swenning, forester of the Mead Pulp and Paper Company, believes that their work in the Ohio valley indicates yield from planted cottonwood of not less than 45 cords per acre in 20 years. He explained that this company considered 20 years to be the completion of both the growth and financial rotation of cottonwood.

R. H. Laftman of the Bogalusa Paper Company, says his company expects to grow merchantable pine pulpwood in 14 years, this, of course, being due to the extremely rapid growth of Loblolly.

R. S. Kellogg of the News Print Service Bureau, believes that in the northeastern states pulp companies might anticipate, with a spruce pulpwood rotation of 40 years, a growth of approximately one-half-cord per acre per annum; that in the southern pine regions it was not unreasonable to anticipate a growth of two cords per acre per annum; that on the Pacific coast the same growth might be obtained under optimum conditions but with a longer rotation; that with the use of cottonwood in the Mississippi River valley pulp and paper companies could produce more wood fiber per acre than anywhere else in the United States, and that companies using the soda process might well investigate the possibilities of that region.

At a meeting of the section, E. W. Kiefer of the Port Huron Sulphite & Paper Company, Port Huron, Mich., in commenting on his experience with the peeling of pulpwood stated that his loss was 15.8 percent hand barking, and that with the Morrow machine barkers the loss was 28 percent. He finds there is an advantage in peeling pulpwood before storage, and said that the time was probably not far off when much of his company's wood would be put up in peeled condition. C. W. Hurtubis of the Hammermill Paper Company, Erie, Pa., suggested that wood cut during the winter season peels almost as easily in the next sap season as though it were cut during the sap season.

Harry Fletcher, of the Fletcher Paper Company of Alpena, Mich., emphasized the necessity of fire prevention, and surprised the audience with the statement that he would prefer spruce that had been slightly scorched to green wood, in view of the fact that this wood would stay preserved as well as peeled wood and that the resulting pulp was whiter than that obtained from ordinary dried pulpwood.

Favors a National Forestry Policy

Continuing the interest which President Harding took in the forestry question, President Calvin Coolidge in his first message to Congress expressed his concern in this matter, and said that he was looking forward to the constructive recommendations which should be made by the Senate Committee on Reforestation. He coupled highways and forestry in the following paragraphs of his message:

> "Highways and reforestation should continue to have the interest and support of the government. Everyone is anxious for good highways. I have made a liberal proposal in the budget for the continuing payment to the states by the Federal government of its share for this necessary public improvement. No expenditure of public money contributes so much to the national wealth as for building good roads.
>
> "Reforestation has an importance far above the attention it usually secures. A special committee of the Senate is investigating this need and I shall welcome a constructive policy based on their report."

Thus does the president carry out the spirit of interest shown when he received Senators Moses and Kayes of New Hampshire, who urged that the appropriations under the Weeks Law for purchase of additional forest land be restored to the pre-war figure from the $450,000 allowed under the last appropriation. Charles Lathrop Pack was also assured of the President's deep interest in forestry on a recent visit to the White House.

Books on Paper And Lumber Industry

"Pulpwood and Wood Pulp in North America" is the title of one of the best works on this subject ever offered the public, and the author is R. S. Kellogg, secretary of the News Print Service Bureau. Especially notable is the fact that the quantity of statistical material which the book contains is largely given in chart form, rather than in the usual hard-to-read tabular form. Divided into five parts, the book takes up separately the subjects, wood pulp, pulpwoods, timber supply, timber production; and last, but not least, the topic, "A Permanent Industry(?)."

At the same time that this valuable work comes from the McGraw-Hill Company's presses, there is published by John Wiley & Sons a new book by Nelson Courtlandt Brown, entitled "The American Lumber Industry." This book is announced as completely covering the resources, production, distribution and utilization of lumber in the United States. It carries a foreword and introduction by John W. Blodgett, president of the National Lumber Manufacturers Association, and W. B. Greeley, chief of the United States Forest Service.

Reforestation on Canadian Prairies

An interesting forestry development is being noted in the western Canadian prairies which were originally known as treeless country.

From 1901 to 1923 seventy million seedlings and cullings have been sent to the west and distributed free of charge as is done by the New York State Conservation Commission. As a result, there are now 40,000 shelter belts, the value of which settlers estimate as being from $500 to $5,000. These woodlands not only provide shelter from wind, but give added attraction to the country.

How Thick Is an Inch Board?

"The United States Department of Agriculture will not jeopardize the success of the great lumber standardization movement by standing inflexibly on its recommendation as to how thick an ordinary inch board should be." This is the statement made by Secretary Wallace on the eve of the general conference of lumber producers, distributors, and consumers in Washington this month to arrive at lumber standards.

"How thick is an inch board?" has been an outstanding point of difference among lumber producers and users since the standardization movement began several years ago. Recently, this seemingly minor point came into still greater prominence when the Central Committee did not agree with the research findings of the Forest Products Laboratory in the matter. The laboratory considered that 26/32 inch was the thickness to which "inch" softwood lumber should be dressed in order best to serve the requirements of use. The Central Committee's recommendation, which allows the manufacture of boards one-thirty-second of an inch thinner, is apparently not so satisfactory to the majority of retail lumber dealers and to many users as is the thicker size.

There is great danger that in the present intense controversy over sizes the lumbermen, dealers and wood-users will lose sight of the great benefits to be gained by the immediate adoption of the lumber standardization program as a whole, says Secretary Wallace. And he adds: "By its effect on the conservation of forests it has an important relationship with the policy of reforestation which President Coolidge pointed out in his message to Congress has an importance far above the attention it usually secures. The standardization of names for the hundred different native softwoods will alone save the consumer endless confusion. He can not purchase wisely when, for example, the same kind of pine is being offered him at various prices under thirty different names. Nor can he change from one wood to another and be sure of the quality he will get when the two woods are graded under different rules, one permitting more defects than the other in grades of the same name. If two woods can be used for the same purpose there is no reason why they can not be graded alike."

The Seinzhenier Paper Co., St. Peter street, New Orleans, La., has suffered a fire loss estimated at $100,000.

Waste in Pulp and Paper Industry

False Economy in Shutting Down

By B. T. McBain, *Assistant General Manager, Nekoosa-Edwards Paper Co.*

THE idea that seems strong in the minds of many mill people—that it is good business to shut their mills down once in a while to help the market or, in the case of a slowing up of the market simply to save the pay roll, is to my way of thinking only a waste of everything else but the pay roll. Everything is on hand for full production—power is available in the river, coal is on hand for fuel, the mills are in repair and there is storage space for the product.

I do not know of one time when there was a slack period but that following it there was a rush period when all the stock piled up during the slack period was disposed of.

Why should you charge interest against the finished product in the warehouse when figuring its cost when selling? You would have had everything piled up in the yard or in the warehouse in some other form and no interest would have been charged against it. All you are out, if you run, is the interest on the labor in most cases and that is all you save when you shut down. Of course, if the stock remains on hand over a year, new stocks of raw material are necessary and that is a different story.

Your overhead runs against your plant whether it is running or down. Taxes, insurance and depreciation are as sure as death and the undertaker. You must heat your plant and must keep it well lighted under insurance regulation. If you are down one day, in most plants the fixed charges increase the conversion costs at least 4 percent for each day down. If you have your own pulp mills, sulphite, kraft or groundwood, your raw material conversion costs also are up 4 to 5 percent for each day you are down.

Then again, your sales and general expense items remain the same for the month whether you run or are shut down and this expense is increased per ton about in proportion to the other items mentioned. If your cost is $100 per ton on a certain item when running full production and full time you can safely add at least $3 per ton on the finished product for the increased cost due to each day's shut down, or 4% on all items except the wood in the pulps, the chemicals and like materials.

Just look at your costs per ton for a 27-day month as compared with February, with never over 24 days operating, and you will get an idea of the difference. But, usually, when a mill is down a day or two, there are so many repair jobs you have been wanting to do that your repair costs increase greatly per ton of product for the days you are down. And how does it help the market? If the market is weakening and the jobber quits buying you simply confirm his judgment that there is a softening when you shut down your mills, even for a day, to help the market. Again, what help does a 100 ton mill give the market when it shuts down one, two or three days? It isn't a drop in the puddle when compared with the total production of the country or even of your sales district.

This idea of helping the market by cutting prices also hits me in the funny bone. Who ever heard of making a market by cutting prices? It never has been done and never will be done. While, on the contrary, withdrawn prices—refusing to accept business at cut-throat prices, at figures below your cost, will do more to wake up those who need paper, but who are afraid to buy because of a falling market, than any other procedure and there should be a law not only allowing such action, but making it imperative.

The life of this country of ours depends upon its business prosperity, manufacturing as well as farming, yet the one must work alone while the other is almost ordered by law to combine. Why? Farmers co-operate, "In Union There Is Strength." Manufacturers do not have enough faith in each other and need more team work.

Future of Riordon Co. Uncertain

Reorganization Plan a Failure—Bondholders Preparing to Offer a Plan

The plan for the reorganization of the Riordon Company, Limited, has been abandoned, and it now looks as though the future of the concern lies in the hands of the American bondholders.

In September the reorganization plan that had been very carefully worked out by a committee was announced, and for a time it looked as though it would come though, but there was not the response in the form of new capital that had been expected. Now the payments made in this connection will be returned.

When a few weeks ago it was reported that the 8 per cent bondholders had agreed to forego payment of arrears of interest in cash by accepting preferred stock, which would have meant an improvement of $1,500,000 in the working capital, it was thought that the reorganization would certainly be accomplished. But the confident predictions then made were evidently based chefly on hope.

It is now announced that the two bondholders' committees have undertaken to formulate a new plan for the reorganization of the company and that negotiations to this end are now under way. What will become of the interest of the preferred and common stockholders it is impossible to say, but it is quite possible that both may be wiped out.

The company's mills are operating as before, the bank loans being sufficient for the carrying on of operations in the woods during the winter.

In their announcement Messrs. Killam and Donham, the reorganization managers, say: "Meanwhile it is only through the efforts of the bondholders' committees and by raising large sums directly or indirectly on security of the deposited bonds that it has been possible to provide the temporary financing necessary to keep the market intact, the mills in operation and the enterprise a going concern. The plan of September 7th, 1923, was formulated for the purpose of giving to the shareholders and unsecured creditors of the company an opportunity, by contributing substantially to the new money required, to participate correspondingly in the ultimate profits of the enterprise. The lack of any general response on the part of the shareholders and creditors makes it evident that they are not prepared to assume the burden of financing the reorganization."

Blotting Paper from Wood Pulp

As a result of investigations recently conducted by the Forests Products Laboratories of the forestry branch of the Department of the Interior, Canada, in their experimental paper mill, blotting paper with excellent absorptive qualities has been produced entirely from pulp wood.

An interesting feature of the new product is that it contains a large proportion of pulp made from a wood which, though plentiful, has found little employment in the Canadian pulp industry.

"A Friend In Need"

The many friends in the papermaking field of Judge Charles F. Moore will be deeply touched by the news that this "friend of many men" now lies helpless in his bed, the victim of paralysis.

There are probably few men who are so well known to those in the paper industry as Judge Moore. For many years he has been referred to as "the permanent toastmaster" at the dinners of the Technical Association. His connection as legal adviser to many paper concerns and his voluminous writings on many phases of the paper business have brought him into personal contact with many in the field and this acquaintance has been widely extended by his many other activities.

It is now within the power of his friends to extend to Judge Moore a helping hand of which he stands in immediate need. The way in which this can be done is set forth in an appeal sent out by the "Judge Moore's Book" Committee. The membership of this committee is as follows: N. R. Hopkins, Hugh P. Baker, H. F. Harrison, Chas. A. Gordon, John Matthews, L. D. Post, Henry W. Stokes, Martin Cantine, W. S. Cowie, Arthur C. Hastings, Arthur H. Nevius.

The appeal of the committee reads in part as follows:

> "In a little house on Long Island a friend of many men lies helpless in his bed. Paralysis has killed part of him. Judge Charles Forrest Moore, writer, lecturer, the kindly humorous philosopher is utterly unable to walk—unable to keep on giving his brains, his heart and his life to the service he loves.
>
> "Judge Moore always gave all he could, careless of any return except the love of men. The greatest men in the land have called him 'friend.'
>
> "But now the love and affection for the Judge must be translated into quick action. He needs help. There is no question of charity in it. It means that we and you should pay an infinitely small part of the debt we all owe the Judge.
>
> "If we could take you to his room, if you could see him lying there, broken in body but happy and whole-souled in spite of need, *you* would not hesitate—no man would refuse to do his share.
>
> "We want this to be as personal an appeal, as intimate as if you were standing by the bedside.
>
> "Some of his friends have made it possible for you and all of us to help the Judge. His best speeches and lectures have been gathered together. He had edited them. They are being printed in a beautiful book that the hands of affection are making.
>
> "There will be no profit from this book to anyone but the Judge. The price is $10. The book will be ready early in January. But we do not want to wait. The time of the Judge's need is *now*. We must know about how many copies to print so that the greatest amount of good can be done.
>
> "We want you to sit down, and send us your check made payable to N. R. Hopkins, treasurer, by the first mail you can make. The result must be an overwhelming tribute to this man. It cannot be unless every man responds. Get one book at least. Take five or ten, if you can, for distribution among your friends. But do quickly whatever your heart tells you to do."

Orders for books and remittances should be mailed to N. R. Hopkins, treasurer, "Judge Moore's Book" Committee, 200 Fifth Avenue, New York.

The Coming Year

The year 1923 is about over. Ahead looms 1924. What has it for the paper industry? It is a moot question.

The year 1923 has been troubled with labor dissensions, unfair foreign competition, high building costs, low prices and similar things to drive the paper manufacturer mad. The outlook for 1924 holds much that is better.

Labor is gradually settling down and the prospect for the year is that there will be a greater stability than at any time since the war.

There is no immediate hope for a removal of the unfair foreign competition troubles. The mass of preceding cases and the vast quantity of cloying red tape necessary to be unwound before President Coolidge could possibly consider an increase in tariffs upon paper imports, make it impossible to forecast any great sunburst of hope in his direction. However, abuses of the tariff will be punished.

Better prices for the product of the paper industry are expected with the better business conditions that are being forecast for the year. Business leaders in many lines are free in their predictions of a boom year in 1924. Those who have spoken in the paper industry are extremely hopeful. Among these optimistic expressions are predictions that prices will be better as the demand for the product increases.

On the whole the outlook is good. It is presidential election year and far be it from any governmental administration to cast a monkey wrench in the machinery during such a time. Taxes will undoubtedly be reduced. Railroad freight rates are expected to go down and it is not an over-sanguine expectation. The mild winter and the lack of strikes in the coal mining industry is likely to keep the price of that commodity down. The steel market is firm but not unduly high.

The paper industry enters the year 1924 with the best prospects in several years. The troubles of the last few years are subsiding, the industry as a whole is far more substantial, the failures that were bound to come are rapidly being masticated and the leaders in the industry are facing the baby year with a smile of hope.

From everywhere greetings and good wishes come to PAPER. They come on all kinds of papers from thin slices of pulp wood to the most expensive cards and papers. The spirit of the holiday and the New Year cannot down. It must be given expression.

PAPER extends to every reader and every friend the wishes for both a happy and a prosperous New Year.

Cost Figures That Help Sell

Every manufacturer realizes that when his plant operates at less than capacity, the cost of his product rises. He cannot, however, raise prices to correspond with the costs. Rather, he lowers prices so as to get more work into the plant, and by enabling him to spread the overhead expense over more product to reduce his costs. In this way he attempts to get back the cost of labor and material plus a part of the overhead that goes on whether the plant is busy or not, writes William R. Basset, president of Miller, Franklin, Basset & Company, Inc.

Usually the shading of prices for this purpose is done by guess work without a cost system properly designed for the purpose; if so the prices may be cut to an extent that makes the loss greater than it would be if the plant were shut down.

Informative figures can be obtained without an unduly complicated cost system. It simply requires that a normal figure for each item of expense in a department be determined based upon the normal activity of that department.

Each month the normal and actual figures are compared. Those items which fluctuate with the activity of the plant are in one group and those which do not are in another.

Knowing accurately the labor and material cost of the product it is then possible to accurately determine what the result on profits will be if a given amount of business is taken at a given price. Unless you have such a method of forecasting costs, your cost system is of doubtful value as a guide in setting selling prices, for business is seldom exactly normal. Actual cost figures must therefore be aided by a knowledge of normals and abnormals.

Year's Paper Production Was High

"Although the production of paper in the few weeks preceding the annual inventory period is not likely to be large, it is now evident that the volume of paper production in the past year has been high," says the market review in the *Paper and Pulp Industry*, the monthly publication of the American Paper and Pulp Association, which adds, "When final figures are available it may be found that the volume is nearly or quite equal to that of any preceding year.

"With a prospect for generally good business throughout the coming year in all industry, the paper manufacturers should expect an increasing demand after the first of the year both to replenish stocks, and to meet current demand. There are no basic business conditions which warrant any pessimistic sentiment as to the coming months.

"The American Paper and Pulp Association on production show that October production was about 12 percent higher than in September, and in some grades back to the high figures of June. Fine papers have been continuing active and holiday sales have not been without a good effect on the wrapping paper group. The percentage of return from sales may have been smaller during 1923 owing to sharper competition than was experienced in 1920, but no industry can be considered in an unprosperous condition when sales of its products are near to the high record."

Handsome Christmas Greeting

A very handsome four-page folder carrying Christmas greetings has been issued by the Great Southern Lumber Company, Bogalusa Paper Co., Inc., and Bogalusa Turpentine Co., Inc., of Bogalusa, La.

Heavy parchment paper has been used for the folder and the entire message is carried on the first page. At the top is a halftone reproduction of men sowing seed, with the caption, "Sowing Pine Seed." This picture and the copper plate engraving carrying the message have been printed in appropriate spaces impressed on the rough surface by the hot-plate process, giving the folder an air of impressive elegance.

The message is as follows:

> At Christmas time our thoughts turn to the happiness and welfare of our customers and friends.
>
> It is fitting, therefore, that we send you a message of assurance of a perpetual supply of lumber, paper and naval stores, made possible by our program of reforestation.
>
> As the years roll by, we will at each Christmas, portray to you the growth of our planting, thereby, giving concrete proof of future prosperity to the users of "Bogalusa" brand products and ourselves.

Extra Dividend by St. Maurice Paper Co.

The St. Maurice Paper Company in addition to paying its quarterly dividend of 1½ per cent towards the end of December, has announced an extra dividend of 5 per cent on business to the 19th of December.

This bonus is the first of its kind announced in pulp and paper circles since the depression of 1920-21.

The incident is indicative of general conditions in the newsprint industry. St. Maurice is a subsidiary of the Union Bag and Paper Company. Bonuses by other newsprint companies are considered probable.

Import Pulp for Artificial Silk

Courtauld's, Limited, the big British artificial silk manufacturing firm, has bought 240 acres of Land at Cornwall, Ont., where they will erect a big Canadian branch.

As the required pulp will be imported from the Scandinavian peninsula, the promoters were asked as to the possibilities of using Canadian pulp. The information was elicited that it could not be adapted to the fine work required in yarn manufacture. It was entirely too coarse. The imported pulp, on the other hand, was obtained from trees grown on preparade land and cut when not yet full grown. This resulted in a finer grade.

Construction News

South Jacksonville, Fla.—The Florida Paper Mills Co., recently organized as a subsidiary of the Grass Fibre Pulp & Paper Corporation, Leesburg, Fla., is making ready to lay foundations for the first unit of its proposed mill on site acquired at South Jacksonville. It is estimated to cost about $200,000, with power house, machine shop and other auxiliary buildings. The company is said to have purchased machinery to an amount of about $100,000, and will place further orders at an early date. Gilbert Leach is secretary and treasurer of the parent company, in charge.

Chicago, Ill.—The La Salle Paper Co., 171-73 North Dearborn Street, is taking bids on a general contract for the erection of a new two-story and basement building, 50x115 feet, at Adams and Peoria Streets, estimated to cost $75,000. It will be used for general operating service. A. Epstein, 2001 West Pershing Road, is architect.

Tuscaloosa, Ala.—The Chamber of Commerce is negotiating with a paper manufacturing company, name temporarily withheld, for the construction of a local mill, and is offering inducements in way of a suitable site. It is stated that the plant will cost in excess of $1,000,000, comprising a number of producing units, with power plant.

Middletown, Ohio.—The W. B. Oglesby Paper Co., is completing plans for the erection of a new unit at its Sorg-Oglesby paper mills, to be a two-story, 100x100 feet. The installation will consist of three washer machines, a number of rotaries, equipment for the manufacture of mill bleaches from fluorine gas and lime water, and auxiliary apparatus. It will cost in excess of $125,000, with equipment. Thomas G. Scott & Sons, Middletown, are architects. L. C. Anderson is vice-president.

Godbout, Que.—The St. Regis Paper Co., Ltd., Montreal, Que., has awarded a general contract to the Canadian Comstock Co., Montreal, for a local hydro-electric power plant, estimated to cost about $100,000, with machinery. The installation will include water turbine, generator, switchboard and auxiliary equipment, with transmission lines.

St. Louis, Mo.—The Orchard Paper Co., has acquired a building at 1113 South Twelfth Street, and will remodel and improve for a local plant. Equipment will be installed at an early date.

Cohoes, N. Y.—The Mohawk Paper Makers, Inc., will commence the construction of a new one-story power house, with capacity of about 750 hp. for general mill service. It will cost close to $100,000, with machinery.

Eau Claire, Wis.—The Dells Paper & Pulp Co., Dells Dam, has plans nearing completion for extensions and improvements, including the remodeling of its two-story pulp mill. Additional equipment will be installed. The work is estimated to cost $500,000. L. A. DeGuere, Wood Building, Wisconsin Rapids, Wis., is architect and engineer.

Worcester, Mass.—The United States Envelope Co., Springfield, Mass., has leased the former local plant of the Richardson Mfg. Co., and will remodel and improve for extensions. It is proposed to use the structure for the time being for storage service.

New Orleans, La.—The Letellier-Phillips Paper Co., is planning for the rebuilding of the portion of its works at 623-45 South Front Street, destroyed by fire, December 6, with loss estimated at $50,000, including equipment.

Valatie, N. Y.—The Centennial Paper Mills, Inc., is planning for the installation of additional equipment at its power plant, including steam turbine, 200 kw. generator, and auxiliary equipment.

Kalamazoo, Mich.—The Kalamazoo Vegetable Parchment Co., has work nearing completion on its new mill, in course of construction for a number of months past, and plans to have the unit ready for service early in January. It will represent an investment of close to $3,000,000. All machinery will be electrically-operated, with rated capacity of 100,000 pounds of fine and waxed papers per day.

New Orleans, La.—The Great Southern Lumber Co., Bogalusa, La., is perfecting plans for the erection of its proposed local mill, to be equipped for the manufacture of paperboard products, estimated to cost close to $1,000,000, with power house, machine shop and other subsidiary structures. It is expected to lay foundations in January.

Edmonds, B. C.—H. W. Kent, Portland, Ore., and B. A. Strawbridge, Seattle, Wash., are organizing a company to construct and operate a wood pulp and sulphite mill on site selected at Edmonds, Vancouver Island, estimated to cost in excess of $250,000, with equipment.

New Companies

Philadelphia, Pa.—The Frank H. Hodgson Co., has been incorporated under Delaware laws with capital of $350,000, to manufacture wall paper and kindred products. The incorporators are Frank H. Hodgson, Charles A. and Henry Asam. The company is represented by the Corporation Guarantee & Trust Co., Land Title Building, Philadelphia.

Camden, N. J.—The Victor Wall Paper Co., has been incorporated with a capital of $50,000, to manufacture and deal in wall papers. The company is represented by the New Jersey Corporation Guarantee & Trust Co., 304 Market Street, Camden.

Port Chester, N. Y.—L. Gans, Inc., has been incorporated with a capital of $15,000, to manufacture paper goods. The incorporators are L. and M. Gans, and J. Cohen. Baruch & Rosen, Port Chester, are representatives.

Financial

Albany, N. Y.—The Perforated Wrapping Paper Co., has filed notice of increase in capital from $120,000 to $480,000, for general expansion.

New York, N. Y.—The Porto Rico Paper Supply Co., 134 West Fourteenth Street, has arranged for an increase in capital from $6,000 to $24,000.

Lansing, Mich.—The Dudley Paper Co., recently increasing its capitalization to $300,000, is planning for the sale of a block of preferred stock, the proceeds to be used for genera operations and expansion.

Plant Operations

All of the paper mills in the Mechanic Falls, Me., distric are running full, with regular working forces, and are said to intend continuing on this basis for an indefinite period.

Of the twenty-two paper mills on the Pacific Coast, practically all these plants are now running at regular capacity, employing full working quotas. The mills have a gross rated output of 2,000 tons per day, including newsprint and general commercial paper. The growth of paper manufacture from wood pulp is particularly marked in Oregon and Washington, where mills are now in operation at Oregon City, Lebanon and West Linn, in the first noted state, and at Camas, Wash. Other plants are starting up at Salem and Portland, Ore., and at Vancouver, Wash. It is said that raw material in this section costs $3 a cord, as compared with $12 a cord and above, in the eastern districts.

The Provincial Paper Mills Co., Ltd., is maintaining active production at its plants at Thorold, Mille Roches, Georgetown and Port Arthur, Ont., giving employment to regular working forces. The mills have a total rated output of about 100 tons of paper per day, as well as 60 tons of sulphite and from 15 to 20 tons of ground wood pulp.

Business Opportunities

The Bureau of Foreign and Domestic Commerce, Washington, D. C., has information regarding a company at Santiago, Chile, in the market for American machinery for printing wall papers, Reference No. 8395. Also, of a company at Simcoe, Canada, desiring to purchase corrugated paper boxes, No. 8457; and of a company at Halifax, N. S., in the market for pulp wood grinding equipment, No. 8461.

Carl H. Nystrom, chemical engineer, who has been abroad for several years, has just returned from Sweden to resume active interest in the paper industry of the United States. Before going abroad, Mr. Nystrom was identified with the engineering departments of several well known paper and pulp mills here.

Farmers Oppose Embargo

The Canadian Pulp Wood Commission is having a holiday, but the farmers continue to protest against the proposed embargo on exports of pulpwood.

At the recent convention of the United Farmers of Ontario at Toronto a resolution was adopted strongly declaring against it. Settlers from northern Ontario contended that with an embargo on pulp wood prices would certainly drop, and in support of this view they pointed to the effect of Americans entering the Canadian market. It was also pointed out that the selling of wood was the only means that the settler in the north has of getting ready money during the first few years on the land.

The indications are that the strong Progressive group will fight the proposed embargo tooth and nail during the coming session of Parliament.

The Ontario Government is not saying much about the subject, but as the development of northern Ontario is one of the strong planks in its policy, and as it is desirous of assisting settlers in every way possible, it would probably be inclined to put the soft pedal on embargo talk.

Owing to the lack of snow in the northern woods it is quite certain that the proposed demonstration of snow hauling of pulpwood will be postponed from December until late in January or early February. The demonstration, however, will take place at Piercefield, as originally planned.

Myron S. Baker has been appointed manager of the Indianapolis, Ind., office of the Diem & Wing Paper Co., with headquarters in the National City Bank Building.

Buck, Kaier & Co., Inc., importers of wood pulp, have moved away from 342 Madison Avenue to 9 East Forty-sixth Street.

New York Trade News

Frank E. Dunaway, formerly sales manager of the Becker Woodpulp Company of America, Inc., 501 Fifth avenue, is now associated with the Woodpulp Trading Company, of 501 Fifth Avenue, New York. Mr. Dunaway is one of the best known salesmen in the pulp trade.

At a recent meeting of the board of directors of the International Paper Company, Owen Shepherd, treasurer of the Company, was elected a member of the board.

The firm of Johaneson, Wales & Sparre, Inc., wood pulp importers of 16 East Forty-first Street, has taken additional space at that address which greatly enlarges the company's offices.

The Publicity Paper Corporation, paper importers and dealers, of 1476 Broadway, has filed notice with the Secretary of State at Albany of an increase in capital stock from $30,000 to $50,000.

The Merchants Paper & Twine Company is the name of a new concern recently organized and incorporated under New York state laws to deal in paper and twines at 102 Prince Street, New York. W. R. Wisser, of the Paper, Twine & Board Company of New York was one of the incorporators. The new firm will handle general line of paper and will specialize in wrapping papers.

Frank C. Overton, of Castle & Overton, importers of and dealers in wood pulp and other papermaker's supplies of 200 Fifth avenue, returned a few days ago from a several month's tour of Europe. Mr. Overton's trip abroad was mainly on pleasure, and he was accompanied by Mrs. Overton.

Harry Rosenberg, formerly with the Emanuel Salomon Corporation, the American Woodpulp Corporation and other concerns in the paper mill supplies trade, has opened an office at 145 Nassau Street, New York, for L. Sher & Sons, of Reading, Pa., packers of hosiery and underwear clippings for paper mills. Mr. Rosenberg wil lalso deal in other descriptions of papermaking material

The announcement is made that M. O. Millar, Jr., has withdrawn from the firm of Millar & Volker, Inc., packers of paper manufacturers' supplies of 410-414 South Seventh Street, Elizabeth, N. J. The business will be continued by George Volker under the same firm name. Mr. Millar formerly was with the Barrett Company, manufacturers of roofing papers, in the purchasing department.

Westinghouse Specialist Dies

Ralph E. Gilman, special engineer in charge of turbo-generator engineering of the Westinghouse Electric & Manufacturing Company, died in the Methodist Hospital, Los Angeles, December 5. Mr. Gilman on account of illness, had been granted a leave of absence from his duties in East Pittsburgh, Pa., to go to the coast in an effort to improve his health.

He was a graduate of the Leland Stanford University of Palo Alto, Cal., receiving his E. E. degree in 1898. He entered the employ of the Westinghouse Company immediately after his graduation and completed the apprentice course of the company in January, 1901. The next two years he was located in the engineering department. In 1903 he was transferred to the British Westinghouse Company and spent the next five years in London, England. In 1908, Mr. Gilman was recalled to East Pittsburgh and assigned to special duties in the power engineering department. He was in the department continuously until the time of his death.

Mr. Gilman leaves his widow, Aimmie Gilman, of Palo Alto, California.

Doings in Canadian Paper Field

Harmony River Mill to Increase Output

With a group of Boston pulp and paper men at the helm of the reorganized company owning and operating the Harmony River Mill, indications are that production will be materially increased during the current winter. The change in majority control was effected recently.

Although not one of the best known pulp mills in eastern Canada, the Harmony River Mill is one of the oldest of eastern Canadian pulp manufacturing plants.

Under the new arrangement, the bulk of the pulp produced at this mill will be shipped to the United States.

Included in the purchase are important pulpwood land holdings in and about the area in which the mill is located. The new owners plan extensive improvements and additions.

Labor Market Easier

With the return of many of those who migrated to the United States and western Canada during the summer and fall of this year, the labor problem is not so acute. A number of pulpwood operators who were operating at about fifty per cent strength have recruited sufficient men to operate at full strength. Wages have dropped several dollars per month, since the return of the men.

Little snow has fallen and this is hampering woods operations greatly. However, snow is expected very soon.

It is believed that the pulpwood cut of the 1923-1924 winter season will sum up in excess of the 1922-1923 winter season. January, February and March are expected to be excellent cutting months.

S. R. Armstrong, who is conducting the sales of the Mattagami Pulp and Paper Company for the receivers, has returned to Toronto from New York, and is now at the mill at Smooth Rock Falls, Ont. It is expected that the relining of the third digester will be complete by the first of the year which will complete the relining of all the digesters, the combined capacity of the three being 150 tons of unbleached sulphite a day.

Frank J. D. Barnjum, of Annapolis Royal, N. S., was a caller on the Toronto paper trade a few days ago and while there took occasion to comment upon the heavy export f Christmas trees from various parts of Canada. He stated that the depletion of young growth was becoming most alarming. During December no less than 750,000 fir, balsam and cedar trees have been shipped from British Columbia across the border. The farmers receive on an average 2½ cents for each of these trees while the American contractors realized all the way from one dollar upwards. The wholesale export of Christmas trees was rapidly undermining the future supply of pulpwood in Canada and measures should be taken to stop it, said Mr. Barnjum.

L. R. Wilson, the newly named general manager of the Abitibi Power and Paper Company, Iroquois Falls, Ont., has made arrangements for a turkey to be delivered at Christmas to every employee of the Abitibi Company whether in the mill, woods, merchandising, townsite, forestry transportation departments and who is a householder living in Iroquois Falls, the Wye or Little Canada.

Intention of the Riordon Company to proceed with power development at Chelsea, on the Gatineau River is seen in the notice in the Quebec Official Gazette that the Gatineau Company, a subsidiary of the Riordon interests, intends to apply for authorization to have constructed a hydro-electric power house, dam and head works at Chelsea.

The Interlake Tissue Mills, Limited, head office Toronto, has evolved something new in a towel cabinet for tissue towel users. It is a vertical cabinet and instead of the towel being drawn from the bottom as is done with the horizontal cabinets they are extracted from the front on a level with the arm. It is refilled from the top and is attached to the wall with two screws only. It is of metal and is made in white or green.

C. Nelson Gain, who recently left the Don Valley Paper Company at Toronto where he was general superintendent, to accept the general management of the mills at Merritton and St. Catharines of the Garden City Paper Company and the Canadian Vegetable Parchment Company, was waited upon by the employes of the Toronto mill just before his departure for St. Catharines and presented with a handsome walnut smoking set. J. C. Worts, manager of the company, presided at the informal gathering and brief addresses were given by several of the mill men and executives to all of which Mr. Gain replied, expressing the hope that he would always be able to keep in touch with the men with whom he had dwelt so long in perfect harmony.

An agreement is reported to have been reached between the City of Fort William and the Great Lakes Pulp and Paper Company whereby the company will erect a plant in that city at a cost of not less than $3,000,000. One unit, the pulp mill, is to cost $800,000 and is to be in operation in a years time and the paper mill, which is to cost $2,200,000, is to be completed and in operation in two years. The plant will have a capacity of 100 tons of newsprint daily, and no fewer than 600 men are to be employed 250 working days each year, according to the agreement just reached between the parties.

A dispatch received in Toronto from Detroit a few days ago announced that Clifton Howe, dean of the School of Forestry at the University of Toronto, has been mentioned as a possible successor to Professor Filbert Roch, who resigned several months ago as director of the Forestry School of the University of Michigan at Ann Arbor. The position has been left vacant because of inability to find a suitable man.

"British Trade" is the name of the new publication which has made its appearance with headquarters at 8 University Avenue, Toronto. The paper is issued by Weston Wrigley, and is the official publication of the Canadian Association of British manufacturers and their representatives. Its mission is to further the interests of British trade in the Dominion.

Returning to Toronto after a visit to the Cornwall mill of the Howard Smith Paper Mills, Limited, and the Glengarry Pulp and Paper Co.'s mill at Cornwall and the Mille Roches mill of the Provincial Paper Mills, Limited, A. P. Costigane, secretary-engineer of the Ontario Pulp and Paper Makers' Safety Association, says that in all the mills visited improvements have been completed and due attention paid to the minimizing of physical hazards in mill operations.

The Canadian Pulpwood Commission will resume its sittings in Ontario on January 14 at Port Arthur. Later on sessions will be held at North Bay, Sault Ste. Marie and Cochrane. During the month of March sittings will be held in Quebec, the latter part of the month being spent in New Brunswick.

On April 1st the Commission will leave for Winnipeg, Edmonton and Regina and from the latter point the body will go to British Columbia where several sittings will be held. It has been pointed out by the commission that while they have the power to take evidence under oath they do not propose to use it.

A special sixty-page edition of the *St. John Telegraph-Journal* to honor the opening of the new dry-dock in that city was printed on newsprint from the Bathurst Company's new newsprint machine. It is pointed out that the mill, which is the first Maritime newsprint mill, will pay particular attention to the needs of Maritime newspapers and exporting surplus production to the United States.

The mill of the Nashwaak Pulp and Paper Company, which is situated at Reversible Falls, St. John, N. B., has been reconstructed during the last twelve months, increasing its former capacity 33 1/3 per cent. Eighty tons of bleached sulphite are now being produced daily.

R. S. Pratt of New York City, a man vitally interested in the pulp and paper industry, has arranged to pay half the cost of a lookout tower near his hunting and fishing lodge on the north shore of New Brunswick. Mr. Pratt has built a number of cabins and has also built a telephone system extending about ten miles. He is donating the use of the telephone system as well as half the cost of the tower. In that territory during the past few years, forest fires have devastated many thousands of acres of valuable pulpwood lands. It is believed the new tower and the use of the forest telephone system will limit the damage. The tower will be ready in the spring.

Export Statistics by States of Origin

Beginning with January 1, 1924, the Department of Commerce will compile statistics of exports by state of original shipment in compliance with the demand of shippers in the interior, particularly the middle western states. Heretofore the statistical reports have shown only the exterior port from which such exports cleared for the foreign country.

The now report will not show, as might be assumed from thd title, the exports of all products traced back to the original state of production—that would be quite impossible. The staple agricultural products of the Mississippi valley states are to a great extent shipped from the original state of production to northern or eastern concentration points. They may change hands several times before the sale to a foreign country is completed, and in many cases they lose their identity as to state of production by the time they reach the seaboard. This statement applies to also to many manufactured articles, orders for which are placed with the export agencies located at the seaboard who distribute them to mills located in different states. The finished products are shipped from the mills to the seaboard and there assembled and shipped out as an entirety. All shipping documents are prepared at the port, and it would be impracticable to require the export offices to seggregate the products by state of origin in the shippers' export declarations.

All goods shipped on through export bills of lading, for which the declarations are prepared by the shipper in the interior, will be credited to the interior state of shipment. Goods consigned from interior points to seaboard ports, to be there consolidated or reconsigned for export, will also be credited to the state of original shipment if an export declaration prepared by the interior shipper, showing the place of original shipment, is filed at the custom house. Merchandise forwarded from the interior to the seaboard for export by commission merchants, forwarding, or other export agents, and the export declaration prepared by them will in most cases be shown as exported from the port of final shipment, and will so appear in the statistical reports.

The export statistics are compiled from the shipper's declaration filed by the exporter with the Collector of Customs at the port of exportation. The declaration shows the name and address of the exporter, the place from which shipped, the route of shipment, whether by rail or vessel, the port of exportation, the country of ultimate destination, and the description, quantity and value of the exported commodity.

The state of original shipment to be shown in the new report will be the place of shipment as shown by the exporter in the declaration. The completeness and accuracy of the published report will depend directly on the care exercised by the exporter in giving accurate information regarding the state of original shipment, as well as the description, quantity and value of the goods shipped. In order that the government export statistics may be complete and accurate, it is important that the original shipper in the interior, who has personal knowledge of all the facts pertaining to the shipment, prepare the export declaration. Many inaccuracies have shown up in the published statistics on account of the practice of shippers of delegating the preparation of the declaration to forwarding or shipping agents at the port of exportation, who have no knowledge of the goods except what is shown on the bills of lading.

Even in cases where merchandise is consigned to a forwarding or shipping agent at the seaport, it is advisable for the original shipper to prepare the export declaration, showing the interior place of shipment, and mail it to the forwarding agent for filing at the custom house. It will also facilitate the handling of declarations at the port if exporters will show in the column "Class No. Schedule B" the number of the particular commodity class under which the merchandise should be included. That practice will also improve the accuracy of the statistics, as the original shipper is usually more competent to decide the correct classification than the statistical clerks at the custom houses. The export declaration is used only for the compilation of statistics and the information shown therein is regarded as confidential.

Copy of Schedule B, Statistical Classification of Exports from the United States, may be obtained upon request from the Bureau of Foreign and Domestic Commerce at Washington, D. C., its district offices located in principal cities, or any custom house. In quantities they may be obtained for five cents per copy from the Superintendent of Documents, Government Printing Office, Washington, D. C.

Plans are now under way for the addition of certain new equipment and buildings at the Chillicothe Plant of The Mead Pulp & Paper Company, some time after the first of the year.

Dr. Hugh P. Baker, executive secretary of the American Paper and Pulp association, and Colonel W. Du B. Brookings, manager Natural Resource Production department of the Chamber of Commerce of the United States, of whose departmental committee Dr. Baker is a member, have been named to represent the chamber at the coming national standardization conference to be held in Washington, under the auspices of the Department of Commerce.

The Commonwealth Paper Co. has been incorporated at Providence, R. I. The capital stock consists of 250 shares of stock without stated par value. The incorporators are Frederick U. Weigert, Gladys L. Weigert, Fay R. Hunt and Bertha M. Hune, all of Providence.

George E. Williamson, executive engineer of the Strathmore Paper Co., has been chosen president of the Safety Council of Springfield, Mass., which is doing pioneer work in giving lectures and instruction to motor vehicle drivers. Regular courses have been established and both day and evening classes

courses have been established and both day and evening classes.

New Developments in Paper Making

Cellulose from Corn Cobs

Corn cobs have been atracting much attention recently as a source of many important chemicals which can be distilled from them by destructive distillation. The possibility of obtaining cellulose from this raw material is also being considered, as is evident from United State patent No. 1,472,318 which is concerned with a process for deriving a paper making material from the cobs.

In order to do this the cobs are first broken up and then boiled in dilute mineral acids and washed to remove a portion of the acid and such soluble matter as can be removed with water. Then the mass is boiled in a dilute solution of caustic soda. After this treatment the caustic soda is removed, first by centrifugal force and then by mixing the residual mass with hot water. The residue must be boiled once more in order to remove the caustic soda which adheres tenaciously to the cellulose.

* * *

Detection of Mineral Matter in Paper

The mineral substances that are commonly found incorporated with paper are china clay, pearl hardening (calcium sulphite), and agalite or talc. In addition to these may be present alum from the sizing materials, and in coated papers blance fixe (barium sulphite) and satin white (a mixture of calcium sulphite with alumina.) All these substances are incombustible and hence are found in the ash when the sample of paper is incinerated. The separation and identification of these various mineral substances may entail some difficulty. The following notes on the direction of the mineral matters is taken from H. A. Bromley's paper and its Constituents.

Satin white and pearl hardening are entirely soluble in warm dilute hydrochloric acid. They undergo no change in dissolving. Their presence may therefore be confirmed by the addition of barium chloride to the solution, which will cause the formation of a white precipitate of barium sulphate if these substances were originally present in the paper.

China clay, on the other hand, is insoluble in hydrochloric acid. It is soluble in boiling sulphuric acid, but is best detected by treatemnt with a fusion mixture. In this way, that is by the fusing the china clay, the alumina in the same is converted into the carbonate of alumina and the silicate of alumina into the soluble silicate salt. This enables the two substances to be separated and identified.

Blance fixe is also insoluble in acids, and is detected, as with china clay, by fusion. The fusion yields barium carbonate and sodium sulphate. Agalite is also fused and in this way is converted into magnesium carbonate and sodium silicate.

When the presence of calcium and of a sulphite is definitely proven, it indicates that pearl hardening is present in the original paper. In the same way calcium, alumina and a sulphite indicates the presence of satin white in the original paper, and alumin and silica indicate china clay.

* * *

Transfer Paper

The process patented in British patent No. 203,816, is concerned with making transfer paper which comprises two outer sheets or webs, which are coated on their outer surfaces. Between them are arranged one or two other sheets of paper, all the sheets being of the same weight and separably secured together.

The Bureau of Foreign and Domestic Commerce, Washington, D. C., has information regarding a company at Durban, South Africa, in the market for American machinery for printing and handling street car tickets. Reference No. 8362.

* * *

Curious Use of Paper

Paper has been used for a great variety of purposes but, according to the French journal La Papeterie, this is a new one. In a church near Milan, Italy, it is said that the organ has tubes which are made from paper instead of metal. Thus appropriately paper, which serves to convey thoughts in words, now serves likewise to propagate sound.

* * *

Paper With Metallic Coatings

In the processes that are commonly used to coat paper with a metallic film the paper is coated with bole in a coloring machine and then a coating of glue or other adhesive preparation is applied by hand. Then the metallic film is applied directly on the adhesive. The worker uses the blowpipe in this process which is both inconvenient and laborious as well as injurious to the health of the worker.

A new process has been invented and patented in German patent No. 376,614 to avoid these disadvantages. The paper web is first given a coating of an adhesive in a lacquering machine. An adhesive is used which attains its maximum adhesive powers at a high temperature. Various resins, waxes and fatty substances are used in preparing this adhesive, such as shellac, copal resin, beeswax, carnauba wax, paraffine, etc. The coated paper is then passed over a heated body and the metallic film is placed on the paper and presseed by means of a cold press roll. The union of the metallic film and the paper takes place at that moment when the adhesive preparation has attained its maximum adhesive power. The paper is immediately dried after it leaves the hot body and is ready for use. The surface is smooth and even.

Paper Making Machine

In United States patent No. 1,472,572 there is patented a machine and method for making paper which consists of the following essential points. The paper making machine comprises a paper web forming part, a felt apron which is adapted to receive the paper web after it has been formed and special means for extracting the water from the web by means of an air blast. The machine also contains a second felt apron, a set of plain press rolls working with these aprons and a special means located directly in front of the press rolls for extraction of the water both from the felt aprons and from both sides of the paper web.

H. H. Schwartz has arrived from Cleveland, Ohio, to superintend the erection of the main paper mill building for the Columbia River Paper Mills corporation at Vancouver, Washington. He plans to have the work completed in sixty days. The building is a modern style of paper mill architecture and will contain 22,000 square feet of glass; the tiling of the walls is to be three feet high and the remainder of the structure is to be constructed of steel frame work and glass. The whole of this three-units mill is expected to be in operation in April of next year.

The Brown-Wales Co., of 493 C street, South Boston, Mass., has leased to Lyle A. Brown the fourth floor of its building at C and Fargo streets. Mr. Brown will use the quarters for manufacturing paper specialties.

Paper Drying

The paper to be dried is carried over arched belt arranged above the heater. The belt is made of fabric which is pervious to air from all directions. It travels with the web. The heater is open at the top, but the supporting run of the belt, which is of net-like construction, breaks up the heat and also forms cells for the temporary entrapping of air, which prevents scorching. Patented in British patent No. 202,392.

Constitution of Pine Wood

Different methods employed in investigations of pine wood are criticized and preference is given to that of Klason (Svensk. Kem. Todskr., 1921, 33, 150).

If the hydrogen in concentration of the sulphite solutions be properly adjusted the cellulose molecule is not attacked. The hemicellulose, however, is decomposed. When an acid mixture, composed of 80 grams of sodium hydrogen sulphite and 200 cubic centimeters of tenth normal hydrochloric acid made up to one liter with water is used, cellulose and dextrose are scarcely attacked, but the pentosans are readily decomposed.

If, instead of 200 cubic centimeters of tenth normal hydrochloric acid, 500 cubic centimeters are substituted in the above mixture, it acts more strongly and the digestion liquor contains 2.94 per cent of the cellulose as sugar. After heating for four days at a temperature of 100 degrees C with the stronger of the above two mixtures, only 20 percent of the dextrose is decomposed, whereas arabinose under the same conditions is decomposed to the extent of 93 to 96 percent. Xylose treated under the same conditions as above shows a greater resistance, as only 72 percent of it is decomposed. A method is suggested for estimating accurately the relative amounts of cellulose and hemicellulose and the lignin by difference.—Chem. Zentrallblat, 1923, 94 IV, 505.

* * *

Glue in Coating Paper

The Bureau of Standards at Washington has been making experiments in which glue has been used in coating paper. Experiments were made both with bone glue and casein glue. A high grade of English paper clay was used as the coating material.

The results obtained from this series of experiments indicated that the water resistance of paper coated with the aid of glue compared favorably with that coated with the aid of casein containing no formaldehyde. The glue had been mixed with chrome alum for this purpose.

The conclusion has been reached that the degree of waterproofing attained by the use of chrome-alum glue is sufficient to render the paper available for ordinary half tone printing. There are, however, certain difficulties which arose in coating papers in this way in that it was rather hard work to obtain a perfectly even coating due to the fluidity of the coating mixture. More work is being done to overcome these technical difficulties.

* * *

Waterproof and Fireproof Paper

British patent No. 202,884 is concerned with a process for the manufacture of waterproof and fireproof paper for use in making dress patterns, for decorative purposes and packing.

In making this paper zinc chloride, a ten percent solution, ammonium phosphate, ammonium sulphate and other similar salts are used as fireproofing agents and may be applied before or after the sizing process.

Crepe effects are obtained by crimping the sized paper before it is dried, and if a paper with a spongy texture is required, the crimped paper may be covered on one or both sides with a thin sheet of uncrimped treated paper.

Box Board Association Formed

The following announcement has been issued from the office of John R. Mauff, executive vice-president of the new association recently formed in Chicago:

The Box Board Association, an Illinois corporation with executive offices in room 1014 Wrigley Building, Chicago, has been organized, following a two days' session in Chicago at which a personal representation of a large majority of that branch of the paper industry was present.

The importance of this new association to the welfare of the box board trade is best indicated by the announcement that George M. Seaman, president of the Eddy Paper Corporation and president of the Seaman Paper Company, has accepted the office of president, and Walter P. Paepcke, president of the Chicago Mill & Lumber Company, the office of vice-president.

Not only do these names insure the welfare of the industry itself, but the public, and all collateral interests will be safeguarded as one community of interests, in serving which the association will be accomplishing something of inestimable value to the prosperity of its members and those with whom they come in contact in the commercial world.

That Mr. George M. Seaman has the ideal leadership spirit and ability for a movement of this character with its inevitable far-reaching benefits will be best understood by a consideration of the highly successful results obtained by the News Print Bureau, and through which the news print industry, the public and all concerned, so greatly benefited. His prominence as an active figure in the paper industry as a whole, has also been demonstrated in his various other accomplishments requiring indefatigable work.

Such leadership, backed up by a bureau of statistics, functioning in conjunction with a department of graphic charts, should be a guarantee that this association will be the eye of the box board industry, through which it may see and realize the actual facts, requirements and demands surrounding that very important and large branch of the paper industry and guide and conduct the trend of its activity to the welfare of all who may be therewith concerned and thereby benefited.

Service such as this must of consequence promote fair trading and trading practices and further develop both the domestic and foreign markets for box board and it is inevitable that with the large enrollment of charter members and following this announcement of the purposes and personnel of the organization virtually the entire industry will be enrolled in membership in the near future.

John R. Mauff has been elected executive vice-president and the board of directors is composed of names well known in and out of the paper industry world: G. H. Wood, H. L. Rauch, Geo. W. Gair, E. T. Gardner, John Jacobs, M. W. Waldorf, Walter P. Paepcke, George M. Seaman, and W. H. Richardon.

H. S. Hershman, Inc., of New Haven, Conn., has been incorporated to manufacture paper supplies. The company has a capital of $50,000. The incorporators are Harry S. Hershman, Isadore Hershman and Barnett Sachs, all of New Haven.

The Hickory Paper Box Co., has acquired a site and will erect a factory in Hickory, N. C.

A notable addition to the permanent literature of Papermaking is Dard Hunter's "Old Papermaking and the Watermarks of the Old Papermakers," the first book in any language dealing in a comprehensive way with the methods of the early papermakers.

New Uses of Paper*

Some of the Many Ways in which Paper has Supplanted Other Materials in Manufacturing Processes

By Warren B. Bullock

Director Information Service, American Paper and Pulp Association.

In discussing the subject of new uses of paper an effort will be made to avoid the technical and to discuss the subject of paper making and the use of paper by the public in the simplest terms.

In fact, the material to be presented to you is so organized as to serve, if desired, for your own use in case you wish to discuss paper with your classes in elementary chemistry. There is an unlimited field beyond if you wish to go further, but this talk today will contain nothing that could not be used by yourselves in talking of paper, its manufacture and uses, to students in elementary chemistry.

Basic Methods of Manufacture

To have an appreciation of recent development in the paper industry, it may be well to run back briefly to the basic methods of paper manufacture. First of all, paper is essentially a forest product. Ninety-five per cent or more of all the paper made in the United States is made entirely or in part from wood. The balance is from other vegetable fibers, such as are contained in the rag papers. The industry is sixth among America's industries in value of product when we include printing and the manufactures of paper such as boxes, and the annual value of the product is in the neighborhood of a billion dollars. We use enormous quantities of wood, something like six million cords a year, and in converting this wood into paper lies the field of the paper mill chemist.

While the making of paper is a highly developed form of utilization of forest products, it is at the same time a highly developed chemical industry, and therefore of particular interest to the teachers of chemistry. Through the entire process of converting a tree into a sheet of paper, chemistry is everywhere applied.

Have you ever thought of the extent to which you use paper in your daily life? Leave out the use of paper for school books, for writing examinations, for reports of the variety which every school teacher knows. If in this group, there is a husband, the chance is that your first act on rising in the morning is to go to the door and get your daily newspaper—and the milk bottle with a paper cap. If you are an extra good husband you go into the kitchen, stand on a floor covered with linoleum—a form of paper made of mechanical pulp and oil, and light the fire. If you have a wood or coal stove, the chances are you use old paper for tinder. In any event it is more than an even bet that you put on the fire a coffee pot with coffee from a paper box, or a cereal from another paper box. When you return to your room to finish dressing you stand on a rug which you may think is cloth, but which is really tightly twisted paper, woven into the form of fabric. Your house itself may be roofed with shingles made of paper of a special kind—a felt paper, treated with asphaltum or some similar substance, and so treated as to be absolutely fireproof.

And so you might go through the day. If you are a commuter your railroad ticket is paper, or if you go by trolley, you may proffer a paper dollar to the conductor. If you have an automobile you still may have paper, either in the form of paproid cushions, and your limousine undoubtedly has its curtains hung on paper rods to avoid the rattle of a metal roller.

At night when you lounge at home, you may listen to your phonograph with music imprinted on plates composed in part of pressed wood flour—mechanical pulp.

Furniture and Clothing of Paper

In New York there is a paper company office which has paper furniture. It is in appearance made of willow, but in fact the chairs and other articles are made from strong fine paper tightly twisted until it resembles willow, and then woven into form. During the war the Teutonic nations carried this process still further, by weaving threads consisting only of paper, tightly twisted, into cloth, and then making up clothing from this paper cloth. This is a rather coarse fabric cloth, but it was exceedingly cheap, and being waterproofed, was not subject to ready deterioration by water. This is not being extensively made at present, but for a time it was used in large quantities in Austria and Germany.

This process of making paper cloth must be differentiated from the manufacture of artificial silk, and yet the latter is worth discussing, as it is a closely allied forest product. The paper cloth of Germany is made from twisted paper threads, woven into fabric. Artificial silk is a chemical process, but not unrelated to the making of pulp by the sulphite process. In the artificial silk process, the cellulose is entirely dissolved in a fluid of which the essential elements are caustic soda and carbon bi-sulphide. This solution, in consistency like thick syrup, is forced through tiny holes in a brass or metallic plate, and hardened by precipitation in alcohol or some such liquor. This gives tiny filaments which are then assembled, twisted, and worked into threads or yards from which the silk stockings or other articles of wear are woven.

The artificial silk process has a curious relation to a peculiar use of paper for food protection, the greaseproofs and vegetable parchment groups. The greaseproof papers are made by beating the pulp until the cellulose becomes partly gelatinized by mechanical action. The vegetable parchment is paper treated with sulphuric acid, which actually changes the chemical form of the cellulose—too intricate a chemical process for me to attempt to explain to a groug of chemists. In the vegatable parchment the treatment is stopped before the cellulose is dissolved. In the artificial silk, the cellulose is entirely dissolved.

The protection of food from filth by the use of special papers is a rapidly developing phase of the paper industry, and in this group we have some types of paper cans, butter boxes, and cheese containers. The use of paper bottle caps is surprisingly large. If in New York City we figure there are five million people, with an average of five to the family, there will be an average of about one milk bottle per day per family, or a total use of a million of these paper caps daily in New York City alone.

The paper clothing sold in Germany for a few cents of our money is made with a cotton thread for wrap, and the paper threads form the woof. Incidentally it might be mentioned that the developments of paper for various uses was a notable feature of German war industry. Paper pulp was used as a base for high explosives, and an artificial absorbent cotton made of paper pulp was developed for hospital use. This artificial absorbent cotton is now being largely made in the United States also. We have gone them one better in

---

* *Presented before New England Association of Chemistry Teachers, New Haven, Conn., Dc. 8, 1923.*

America by making at the Forest Products Laboratory at Madison, Wis., a cattle food from wood chips and sawdust, treated chemically to produce a digestible form of cellulose.

But to return to the more unique uses of paper. A company has been formed in the south to manufacture paper rain coats, to be put up in packages small enough to go into a pocket, and sell for 25 or 50 cents. They are waterproof, but one may readily doubt whether they will serve for more than one using. It would be interesting when caught in a sudden shower, to pull a raincoat from your pocket and laugh at the weather man.

The use of crepe paper for decoration will soon be in evidence in every home, as Christmas draws near, and we are now offered paper Christmas trees, as a means of saving the young trees of our forests, and at a price that may put the Christmas tree out of many markets.

Some poor shoes are made with paper soles, but even the good shoes have paper heel boards, box toes, and counters. Candy manufactures use paper for imprinting trade marks in the bottom of candies. Car wheels, barrels, waterpails, clothes lines, spoons, dishes all are made of paper, and from the cradle made of paper willow, to the crepe lined box in which our mortal remains are buried, we use paper from the cradle to the grave. Celluloid with all its manifold uses is basically a paper, or a cellulose product.

Wharf Piling of Paper

Out in San Francisco, they are using paper piling for the wharves, to combat the marine boring worms, which will not attack paper. We have book worms but they do not attack the pressed paper such as is used for piling, car wheels, or the paper piping which has been developed so that it carries screw threads, and is impervious to moisture and heat.

Dolls and toys, mill equipment, such as the cones and spindles used by the New England textile mills, are made of paper and in fact, the uses of paper are too numerous to attempt to list.

A unique use of paper, recommended by the government authorities for home dressmaking, is the making of dress forms so that every woman can be her own dressmaker. An undergarment is used as a base, and strips of gummed paper tape, such as is used for sealing packages, are pasted all over this garment while being worn by the woman whose figure is being reproduced. After the gummed tape has been pasted all over the dress form, it is removed, coated with shellac, and the home dressmaker can build her own gowns on a dress form made on her own body.

The telephone company uses some five million pounds of paper a year for insulating telephone wires. Fine paper is tightly twisted about the wires in the cables, and affords the best insulation for switchboards as well.

On the streets you see motor delivery wagons, with bright trade marks on their polished sides. This is another unique paper process, by the use of decalcomania. This is nothing but the use of what children call transfer paper, by which figures are transferred from a sheet of paper to such articles as they wish to decorate.

Of the world's production of about 14,000,000 tons of paper a year, this country makes about one half, and its consumption is even larger, for our imports are larger than our exports. This year's imports will total in value nearly $110,000,000 of which a large portion is for our newspapers.

Improvements at Dells Pulp & Paper Co.

THE Dells Pulp & Paper Company of Eau Claire, Wis., is carrying on an extensive construction program. The work on the new dam is about one-third completed. The forms are all in for the new gate section dam. This dam will consist of steel and concrete structure with thirteen steel tainter gates 26 feet wide and 20 feet deep. It is the intention to have the spillway capacity enough to discharge 116,000 cubic feet of water per second. This is a larger capacity than the old dam, but the railroad commission insists on the new dam having a capacity which will take care of any normal flood. The dam is 400 feet long and built for a 26 foot head. It is situated about 100 feet below the present dam and it is built on a sand rock bottom. The apron, which is all on, is 75 feet in length the full width of the river. Some of the piers are partly poured. The low water in the river is greatly facilitating the work.

The excavation for the pulp mill and power house is completed and it is expected that construction work will begin in the near future with the idea of completing the entire job by spring to take advantage of the spring water.

The power plant and grinder room is a structure 120x116 feet, all reinforced concrete construction. The building and flumes are built at a head of six feet above the present head and the wheels are also set so there can be a drop in the tail race of four feet which can be secured by excavating a distance of 1700 feet down the river.

This shows in the foreground the forms for the new gate section dam. There are to be 13—20x26′ tainer gates. The building in the background is a new power house built in 1922. Just beyond the power house and other shore (the power house is in the river) is where the new pulp mill is being built

One horizontal Allis Chalmers hydro-electric unit of the propeller type of 1600 HP is being installed; in adition to this there will be three similar horizontal units direct connected to three four-pocket grinders on each shaft. The Green Bay Barker Company of Green Bay are building the grinders. A 20-ton travelling crane for handling the generator and other equipment will be placed in this building. The waste wheels are so arranged that in event they wish to give up grinding these can be direct connected to generators. The water turbine installation will include the White hydrocone built in horizontal position.

The wet machine and screen rooms will be in a separate building located on high land adjoining the present paper mill. This is about 150 feet from the grinder room.

This building will be 60x120 feet and two stories high with a basement consisting of a decker stock chest under the entire building. In this building there will be twelve wet machines, five Improved Paper Machinery Company screens, the necessary knotters and sliver screen as well as two Wood's thickeners. The entire department will be motor operated.

This photo shows the place where the new pulp mill is to go. Building on the left is the power house. In foreground is tail race and cofferdam. Building in center of picture with the end boarded up is the old grinder room. White building behind the derrick is one of the paper machine buildings

The production of pulp under the new scheme will probably be 110 tons per day and it is expected that with better operating conditions in the water power plants and the stoppage of leaks through the old dam and old wooden flumes that this company will be enabled to produce sufficient pulp even during the low water season to take care of its own plants.

Contemplated extensions to the present paper and pulp mill building will consist of new floors, additional walls and roofs, increasing the heighth of some of the buildings, the covering of some areas now unoccupied, with steel and general fireproof construction throughout.

The total cost of these improvements will approximate $700,000. When this work is completed the company will have a most modern and up to date plant throughout.

This photo shows a close-up view of the old dam from downstream

L. A. DeGuere, of Wisconsin Rapids, is the engineer in charge of the project and the construction work is under the direction of W. E. Ule, of Stevens Point

To Start Work on New Plant

The Florida Paper Mills Co., of Jacksonville, Fla., a subsidiary corporation of the Grass Fiber Pulp & Paper Corp., Leesburg, Fla., of which Gilbert Leach is secretary and treasurer, will soon begin actual work on erection of their plant in South Jacksonville. First work of construction will be building of a half-mile of railroad track and a hard surface road to take care of transportation. Have about $100,000 worth of machinery to be installed.

The Arthur D. Little Co., Cambridge, Mass., is planning the erection of a paper pulp mill in Jones county, Miss., according to report from Laurel, Miss. C. R. Carpenter, a representative of the mill, having been there looking over conditions.

The Orchard Paper Co., has acquired the building at 1113 S. 12th Street, St. Louis, Mo., and will remodel for a factory, office and warehouse, installing front of steel sash and stucco, and equiping building with sprinkler system.

Adams Company Making Addition

The Adams Paper Company is constructing an addition and making alterations to its mills at Wells River, Vt. Herbert Crabtree, manager of the company, is in charge of the work.

The addition will be of brick, one story, with 10,000 square feet of floor space, and will cost in the vicinity of $70,000. James Lowe of Woodsville, N. H., has the contract.

The walls on the addition are up and it is planned to have the building closed in before heavy snowfall.

Making Pulp Grinders

The Bath Iron Works at Bath, Me., one of the largest shipbuilding companies in the country, is devoting much of its attention at present to the manufacture of Warren magazine pulp grinders. Shipments of the pulp machines are now being made to the Great Northern Paper Company. The machines are designed for wood in four foot lengths and are of heavy construction, each unit weighing approximately 95,000 pounds.

Paper Companies to Take Part

Development of the Dead River region in Maine as a power source together with the power possibilities at Long Falls, Me., will be discussed by Gov. Baxter of Maine and representatives of some of the large power companies operating in that region. For this purpose, a conference will be held in Boston early in the New Year.

The Hollingsworth & Whitney Company, the Great Northern Paper Company, the International Paper Company and other large companies having interests in that region will participate in the conference at the invitation of Gov. Baxter.

Some months ago representatives of these companies and textile interests formed a corporation known as the Kennebec Reservoir Company and appeared before the Maine Legislature for authority to establish a power reservoir near the head waters of the Kennebec. This authority was granted by the Legislature but Gov. Baxter succeeded in bringing about its defeat by vetoing the measure.

It is now believed that the attitude of Go. Baxter has changed and that he will assist in arranging plans for the development of this important water power project.

Paper and Board

New York, December 24.—Reports from New York trade sources generally tell of a slowing down of demand for many kinds of paper. This is not surprising since the approach of the year's end and the inventory-taking period invariably is the signal for consumers to curtail buying, and the market at present is in a quieter condition than has been noted in some time. Of course, holiday activity has stimulated demand for certain kinds of paper, but the movement of supplies for holiday purposes has about ceased, and the trade is now in a waiting position, expectant of good business and favorable market conditions in the new year.

It cannot be said that there is any great weakness in prices of paper. At the same time the price tone is far from strong. Quotations on some kinds of paper are wavering, with the tendency unmistakably downward. This is to be expected with demand slowed down, and yet manufacturers are not exerting pressure on the market, most of them apparently pursuing the wise policy of watching and waiting and permitting the market to follow its own course. Certain descriptions of paper are firm. There is no sign of easiness in newsprint, bag paper and in numerous specialties. On the other hand, consumers are finding manufacturers willing to grant slight concessions on book, writing, wrapping, tissue and other papers, particularly when tonnage orders are concerned. Paper mills want business and they are not allowing a matter of fractional differences in price to stand in their way of landing orders when shading quotations will result in the securing of business.

Newsprint continues in active demand and the movement from mills to consuming centers keeps up on a large scale. Production of newsprint in the United States in November totaled 119,720 tons, compared with 122,073 tons in October, while shipments from mills were 117,176 tons, against 124,894 tons in October. The output of Canadian mills in November was 110,839 tons, contrasted with 114,475 tons in the preceding month, and ships from mills totaled 110,786 tons, against 112,996 tons in October. These figures show that mills in Canada shipped out practically all the paper manufactured during November, while U. S. mills shipped out all but slightly more than 2,000 tons.

Book paper is in somewhat of an unsettled market position. Manufacturers are holding to their previous quotations but it is no secret that they are frequently granting some concessions to customers. This is particularly true when tonnage orders are involved. Book paper producers want business. Most mills are fairly well fixed with contract business but they need more transient business to warrant larger operations, and there is keen compeptition for such orders as come into the market from transient buyers. The average price quoted on machine finished book paper is 6.50 cents a pound f. o. b. New York, but lower prices than this are reported; probably some m. f. book is being secured by consumers down to 6 cents. Coated book is quoted at about 8 cents per pound upwards f. o. b. New York, with the high qualities bringing around 11 cents and even up to 21 cents per pound New York.

Wrappings are quiet since demand for the pre-holiday retail trade has subsided. No further change in quoted prices is reported but the tone of quotations is rather easy, and buyers experience no difficulty in purchasing No. 1 domestic kraft wrapping at 6 cents a pound f. o. b. New York, and at less in exceptional cases. Tissue papers are holding in price but the market for them is much narrower than prevailed a short while ago. Manufacturers enjoyed a fairly large demand for tissue for the holiday trade and prospects are bright for a resumption of buying on an equally broad scale after the turn of the year.

Boxboards display a hardening price tone. In fact, quo-

CURRENT MARKETS—Continued

tations have been advanced slightly by Eastern mills, plain chip now being quoted at $47.50 per ton f. o. b. New York and news board at $52.50 in a majority of instances. It is stated that some consumers have been looking ahead and placing orders for board for future delivery, and while manufacturers are far from rushed, they are managing to keep moderately busy. The Box Board Research Service reports that board mills in the East operated at 63 per cent. of their capacity in the week ended December 8, 13 mills reporting making 2,553 tons of board, receiving new business amounting to 2,173 tons, and having 2,803 tons of unfilled business on hand, while Western board mills ran at 75 per cent. of capacity, producing 7,852 tons of board, receiving new business totaling 5,641 tons, and having unfilled business on hand amounting to 17,233 tons.

Mechanical Pulp

Mechanical pulp is moving in a steady manner and in fairly large volume, according to reports. There is a consistent demand emanating from newsprint, board and other consuming mills, and probably a stronger factor than the current demand is that stocks are unusually small and that grinders are failing to accumulate any surplus of pulp to amount to anything, shipments being about on a par with the present output. Quotations are well maintained at around $40 per ton f. o. b. grinding mills for domestic ground wood for prompt shipment. Foreign ground wood is selling at $38 a ton ex dock New York, and importers are reported bringing in considerable quantities from abroad.

Foreign and Domestic Chemical Pulp

It cannot be said that there is any noticeable strength in the chemical pulp market. At the same time indications point to a much steadier undertone, and it would seem as if prices have at last reached a level at which they show every sign of holding. Sellers are not pressing matters like they were a short while ago and sentiment in the trade is vastly improved, most traders looking for an upward reaction in prices and therefore being content to wait and watch developments.

Papermakers are said to be placing orders for fair amounts of pulp but buying is very spotty. Kraft pulp has worked down to around 2.60 cents per pound ex dock New York for No. 1 foreign kraft, and it is stated that some sales at 2.50 cents have been made. Strong foreign un-

bleached sulphite is selling at around 2.65 cents and probably at a little less. Bleached sulphite is quoted at 4 cents per pound at pulp mills for No. 1 domestic, and at about the same basis for No. 1 foreign, but both domestic producers and importers are shading prices in some cases. Quotations ex dock New York and f. o. b. pulp mills are as follows:

Sulphite foreign—			
Bleached No. 1..	4.00	@	4.50

Domestic Pulp

Papermaking rags exhibit a firm tone. Indications are that consumers are buying in a cautious manner and generally in small quantities, yet there is enough business to be creative of strength in values, while the situation at the supply source is lending firmness to the market, dealers contending that they are not receiving normal amounts of rags from collection sources. Low grades are especially firm. No. 1 roofing stock is quoted at 1.80 to 2 cents per pound f. o. b. New York, with sales reported at the higher figure, while No. 2 stock is bringing 1.50 cents New York. Thirds and blues are quoted at 3 cents or slightly less f. o. b. New York for repacked, and around 2.50 cents for miscellaneous packing. White rags are firm, and new cuttings tend higher. Sales of blue overall cuttings at 9 cents a pound New York have been reported. Quotations f. o. b. this city are:

Imported Rags

The low grades of foreign rags are in principal demand, dark colored cottons for roofing paper mills particularly, and sales of these rags at 1.65 cents a pound ex dock New York have been recorded. Blue cottons are in fair call, and linens are moving in a steady way. Quoted prices are well maintained throughout the list at the following ranges ex dock New York:

Lins., White, No. 1	12.00	@	13.00
Ger. Blue Cottons..	2.50	@	2.75

Dk. Colored Cottons	1.60	@	1.65

Bagging, Rope, Etc.

Prices of old rope continue to display somewhat of an easy tone, due, it would appear, to the withdrawal of a good many customers from the market. No. 1 domestic manila rope is reported selling at 6.50 cents per pound f.o.b. New York and perhaps at a trifle less, while foreign

CURRENT MARKETS—Continued

manila rope is said to have sold down to 6 cents a pound ex dock New York. A little better demand is noted for old bagging though no change in prices has occurred. No. 1 scrap is quoted at 1.25 cents a pound f.o.b. New York, and roofing bagging at 90 to 95 cents a hundred pounds New York. Prices f.o.b. this city follow:

Gunny, No. 1	1.30	@	1.40

Old Paper

Generally speaking, there is a fairly steady tone to waste paper prices, but some grades have sagged slightly. Demand is of moderate volume but it is apparent mills are buying merely to cover their immediate needs. Old magazines have eased to where sales at 1.50 cents a pound f.o.b. New York have been reported though some packings of this grade command well above this price. Old kraft paper also is slightly lower, sales at 2.10 cents a pound New York having been noted. Shavings are steady, dealers in New York quoting around 3.90 cents per pound for No. 1 hard white, and an average of 3.15 cents for No. 1 soft white shavings f.o.b. New York. Folded newspapers are selling at 85 to 90 cents a hundred pounds New York, and No. 1 mixed papers at 55 to 60 cents. White blank news is firm at 2.25 cents a pound New York as a minimum. Quotations f.o.b. New York are:

No. 1 Hard White Shavings	3.80	@	4.00
No. 2 Hard White Shavings	3.25	@	3.50
No. 1 Soft White Shavings	3.00	@	3.25

Twines

The pre-holiday activity in twines has subsided and the market is quieter and devoid of feature other than that the price tone is quite steady. Raw materials are in a strong position and are gradually creeping upward in cost, which of course makes for firmness in twines. Quotations are as follows:

Sisal Hay, pure ...	12.25	@	13.25
Manila Hay, pure..	16.25	@	17.25
Sisal Lath Yarn ..	11:25	@	12.25

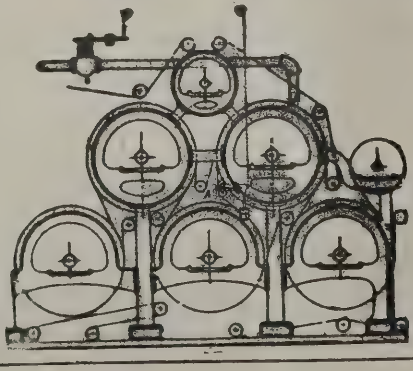
THE PICKLES DRYING REGULATOR



Reasons why you should have it on your machine are: First, it regulates the drying of paper automatically, irregularities are eliminated; second, higher machine finished papers are attainable, because it is possible to maintain the proper quantity of moisture in sheet, as it passes to calenders; third, mills having tried it on one machine have ordered it for all their machines. PAPER

January 3, 1924

The Magazine of the Paper Industry

The Hopes and Fears of 1924

Written for PAPER

By **DR. HUGH P. BAKER**

Executive Secretary, American Paper and Pulp Association

NO industry can be considered unprosperous which for a year has enjoyed a production of almost if not quite record volume. No industry of the importance of the paper industry can fail to share in the prosperity if the country as a whole is enjoying good business. The paper industry, therefore, with a high record of production during 1923, and wth every prospect of good general business in the early months of 1924, is justified in looking forward with optimism to the coming year. Although no exact figures will be obtainable until the 1923 census is completed, the statistics compiled by the American Paper and Pulp and affiliated associations are such as to warrant the statement that the volume of paper production in 1923 was higher than that of 1922, and probably close to the high record established in 1920, the banner year in the history of the industry in the United States.

> **WHO KNOWS BETTER?**
>
> ***What man in the paper industry is better qualified to issue a statement on the coming year than Dr. Baker? His words may be accepted with confidence in their accuracy and as a foundation upon which to lay business plans for the year. He is not a foolish Pollyanna in his optimism, but he does view the year with faith in the fundamental soundness of American industry. He furthermore believes there is plenty of business for those who will get out and hustle for it.***

GOVERNMENTAL statistics on paper production show the total was 7,334,614 tons in 1920, and 7,017,800 tons in 1922. The statistics compiled by the American Paper and Pulp Association in 1923, estimating the December production in accord with seasonal conditions of other years, indicate that the 1923 production will be certainly over 7,100,00 tons, and possibly as high as 7,350,000 tons. The Federal Trade Commission discontinued collecting paper production statistics with May, 1923, and the work was then taken up by the American Paper and Pulp Association, and its affiliated associations. Estimating the total production for the months during which the Association was collecting these statistics, on the percentage of the total mill capacity reported to the Association, it is found that the year's production has passed the volume of business done in 1922, when the paper industry was rejoicing in returning prosperity after the slump of 1921.

As far as the leaders in the paper industry can judge, there is no reason to doubt that the first months of the coming year will see generally good business. In this good business the paper manufacturer may expect to share, and an incerasing demand may be anticipated after the first of the year, both to replenish stock and to meet the current demand.

There is no doubt that the paper manufacturer in the year just closed experienced sharper competition than was felt in 1922, and the return from sales may to this extent have been smaller than in the years of business boom. No industry, however, as said before, can be suffering severely when its volume approaches record figures. The coming year will bring its problems to the paper industry, as to all other industries. A political year is one whose trend is difficult to forecast. The paper industry together with other basic industries, has felt the stress of foreign competition to an increasing extent, as the foreign producers have returned toward normal production. The low labor costs abroad, the tendency of the Germanic countries to sell their products at bankrupt sale prices, have given the domestic manufacturers the problem of how to continue to maintain an American wage scale, without the loss of business to the cheap foreign made paper. The industry, however, is determined to fight abuses in the import of foreign papers, through undervaluation, dumping or improper classification, and to do all that is possible to retain the domestic markets.

THE problem of the raw material reserves of the industry is another question that is engaging the attention of the paper makers, and in an effort to solve the problem, especial attention has been paid to the development of a national forestry policy which will enable the paper manufacturer to grow trees profitably, as forest crops from which his raw material will be derived.

In general, the state of the paper industry at the opening of another year may be considered satisfactory. Basic conditions seem to be sound, the industry itself is in a good position to go forward after the inventory period is ended, and the mill stocks on hand are about normal, so that any increase in demand will mean an increased production to meet the requirements of the trade.

Gustave Lindenmeyr Dies

Gustave Lindenmeyr, head of the paper firm of Henry Lindenmeyr & Son, 32 Bleecker Street, and a director of the Commonwealth Bank, died December 27, 1923, at Pasadena, Cal., after a short illness.

He was 64 and lived at 11 West Eighty-first Street. He was born in New York and had been president of the paper company for more than thirty years. His wife, a brother and three sisters survive him. The body is expected to arrive here on Tuesday.

Multiple Effect Evaporation

Basic Information Bearing on Evaporator Design and Operation—Study of the Problem of Evaporating Waste Sulphite Liquor

THE functions of a multiple effect evaporator such as is used in some of the operations of a soda pulp mill are described and elucidated by Hugh K. Moore, of the Brown Company, in a communication to *Chemical and Metallurgical Engineering* for December 17, 1923. He takes up the principle involved and illustrates the method of attacking an evaporation problem by giving a specific example —xiz., evaporation of waste sulphite liquor.

What are the fundamental considerations in evaporation? Here are at least the more important:

1. Temperature spread.
2. Individual temperature differences (including rise in the boiling point).
3. Static head of liquor over heating surfaces.
4. Viscosity of liquor at different concentrations and at different temperatures.
5. Velocity of liquor over heating surfaces.
6. Specific gravity.
7. Boiling point.
8. Prevention of corrosion.
9. Temperature level and heat conductivity.
10. Sequence in evaporation.
11. Elimination of condensation.
12. Elimination of entrained air and non-condensable gases.
13. Elimination of steam from liquor so as to avoid foaming.
14. Keeping conducting surfaces wet.
15. Keeping surfaces free from incrusting matter.
16. Mechanical construction.
17. Number of effects.

Temperature Spread

Temperature spread in an evaporator is the difference in temperature of the initial steam and the final steam going to the condenser. In designing an evaporation plant the chemical engineer is often called upon to design an evaporator that will fit in with existing conditions in the mill—viz., the condensing water may be limited in amount, or it may rise to a high temperature during certain seasons of the year, or the steam available may be at low pressure, or there may be a limit to which the substance can be heated or a limit to which the liquor may be cooled, and there may be many other considerations which will readily occur to you all.

If the condenser water goes to 85 deg. F. in the summer, you have limited the temperature of the steam going to the last effect to 25 deg. above the limit if the condenser water is 60 deg., other things being equal. (This is a general statement, however, for there may be limitations on the vacuum pump which may modify this to a certain extent.) If the amount of condensing water is limited, you may have to heat it hotter than you would like and a temperature limit is again set below which you cannot go. On the other hand, you may have live steam or exhaust steam, and so you may be limited on this end also.

How It Works Out

Thus assume two cases, one with initial steam at 100 lb. gage pressure, and steam to the condenser at 2 in. absolute pressure, and the other having the initial steam at 5 lb. gage pressure, with vapor going to the condenser at 6 in. absolute pressure. In the first case there is a possible temperature spread of 228 deg. F., while in the second case the spread is only 88 deg. F. It will be seen from the above that the engineer may be seriously handicapped from the start. For in the first case he could use large temperature differences between effects, and a small evaporator or more effects with a small temperature difference.

In the latter case he must confine himself to a very few effects with a large temperature difference, or if he increases the number of effects, the temperature difference between them will have to be so exceedingly small that he will require an evaporator of enormous size. This must be so self-evident that no further attention will be given this phase of the subject and we shall pass on to that phase of the subject in which the allowed temperature spread may be the same. Under these conditions the greatest economy will be in that evaporator which utilizes the least part of this allowed temperature spread, other factors of course assumed to be equal.

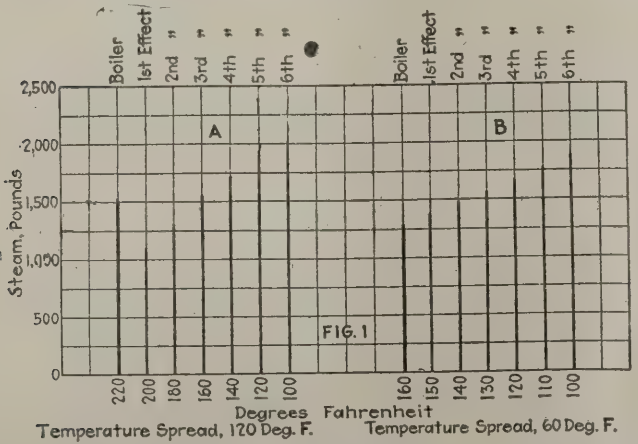

FIG. 1

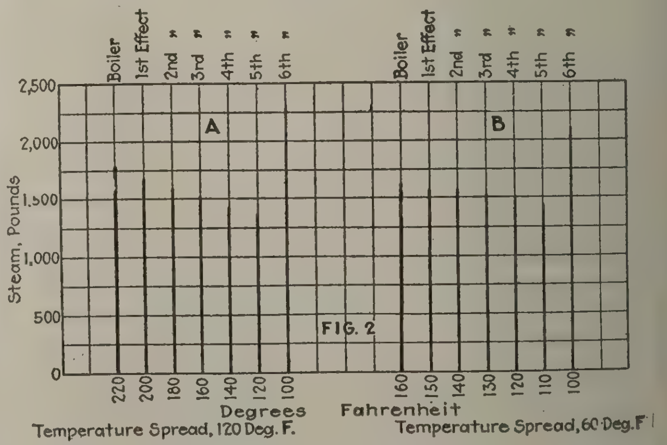

FIG. 2

Figs. 1 and 2—Showing Effect of Decreasing Temperature Spread With Uniform Temperature Differences

To illustrate this point two charts, Figs. 1 and 2, are printed herewith which are calculated on a theoretical basis, all factors considered equal with the exception of the temperature spread, which is, of course, governed by the individual temperature difference. In these charts loss by radiation will not be taken into consideration; first, because this factor is largely within individual control, and, second, because this is governed by too many factors to be considered in a general discussion of the principles of evaporation, in which size, surrounding temperatures and the individual temperatures of each effect, etc., are not considered; though, of course, it will be readily seen that the lower the average temperatures the lower is the heat lost from this cause. What we wish to show is that if by some means or other we can get a higher heat conductivity per square foot of heating surface and thus lower the individual temperature differences and thus the total temperature spread, we can with the same size of evaporator, other things being equal, obtain a greater economy in that evaporator which has the lowest temperature spread. It should also be stated that as in this discussion we are to consider several variables and that as inasmuch as the only way to see the effect of any one variable is to keep all the others constant, unless specially mentioned it must be understood that the above method will be adhered to.

Let us assume as a basis 1,000 lb. of solids the specific heat of which is 0.5, in a water solution such that the percentage of solids will be 8.54 per cent, that the temperature of the liquor is 160 deg. F., the number of effects six, the temperature spread allowed 120 deg., with the steam going to the condenser at 100 deg., and concentration to 50 per cent. Rise in boiling point or radiation will not be taken into consideration and as tabular data for calculation of the charts would consume much space, only those absolutely essential will be included. In Fig. 1 is shown (*A*), forward or parallel flow evaporation, using a temperature difference of 20 deg. F., (*B*), the same with a temperature of 10 deg. F. In Fig. 2 is shown (*A*), backward or, counter-current flow with a temperature difference of 20 deg. F., and (*B*), the same with a temperature difference of 10 deg. F.

A study of these charts will show that by decreasing the temperature spread from 120 to 60 deg. we have raised the ratio of water evaporated to steam used from 6.18 to 7.67 in the case of parallel evaporation, and 5.49 to 6.02 in counter-current evaporation. It will also be noticed that the steam to the condenser is decreased in both cases.

In the above theoretical examples we have assumed a uniform temperature difference of 20 deg. F. in *A*, Fig. 1 and Fig. 2, and a uniform temperature difference of 10 deg. F. in *B*, Fig. 1 and Fig. 2. Such uniform temperature differences rarely, if ever, in actual practice and the charts are submitted only to show a principle which every engineer must take into consideration, if he is to design an evaporator which will operate at the greatest efficiency.

Individual Temperature Differences

In order to reduce the total temperature spread, it is self-evident that we must reduce the individual temperature differences between the heating on one side and the liquor undergoing evaporation on the other side. The first natural impulse is to say this should be done by increasing the heating surface. Unfortunately, the solution does not lie with so simple a remedy, for by doing so you increase the first cost, increase the cost of maintenance and repairs, and increase radiation losses and fixed charges, to say nothing of the chances of increasing leaks and the cost of labor. We naturally have no other course

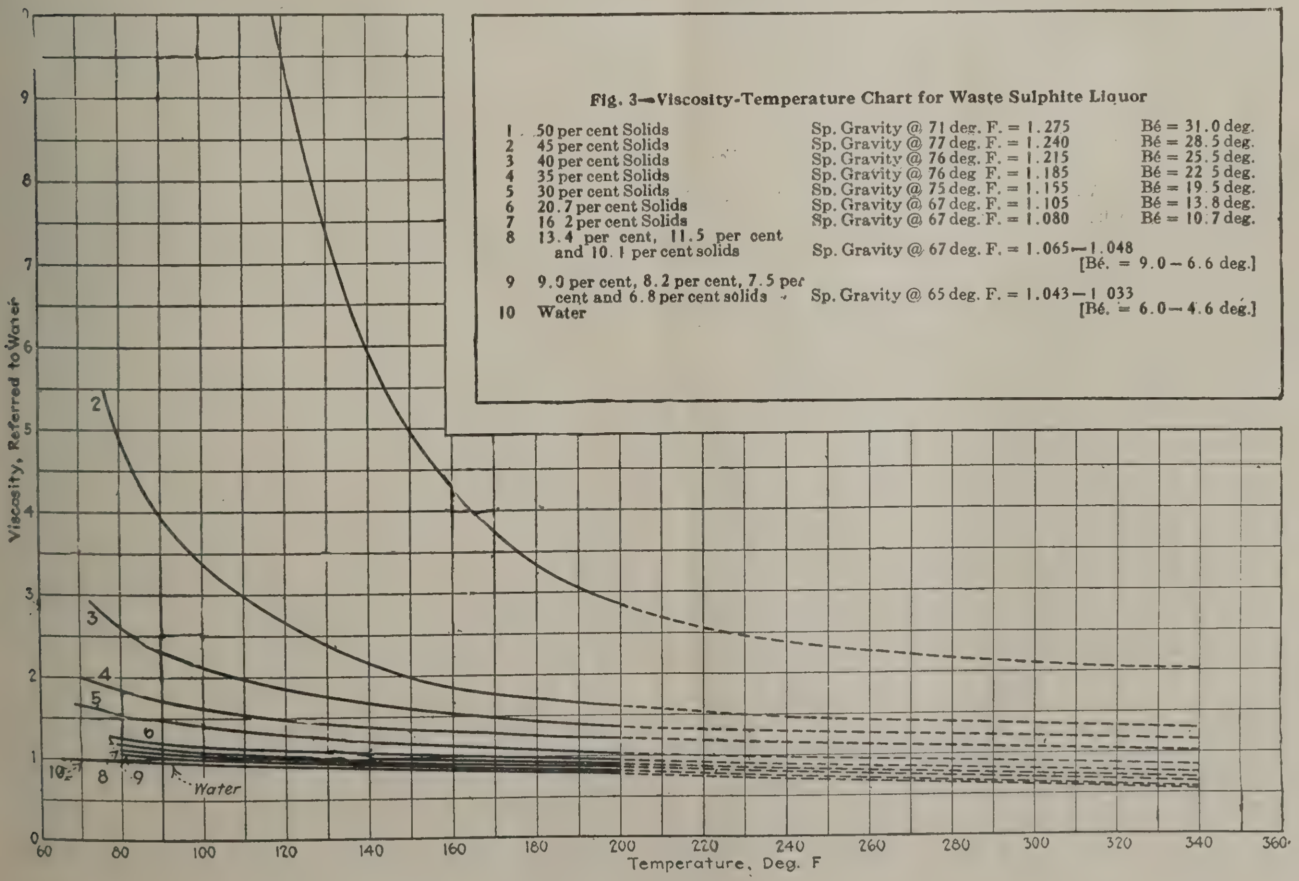

Fig. 3—Viscosity-Temperature Chart for Waste Sulphite Liquor

1	50 per cent Solids	Sp. Gravity @ 71 deg. F. = 1.275	Bé = 31.0 deg.
2	45 per cent Solids	Sp. Gravity @ 77 deg. F. = 1.240	Bé = 28.5 deg.
3	40 per cent Solids	Sp. Gravity @ 76 deg. F. = 1.215	Bé = 25.5 deg.
4	35 per cent Solids	Sp. Gravity @ 76 deg F. = 1.185	Bé = 22 5 deg.
5	30 per cent Solids	Sp. Gravity @ 75 deg. F. = 1.155	Bé = 19.5 deg.
6	20.7 per cent Solids	Sp. Gravity @ 67 deg. F. = 1.105	Bé = 13.8 deg.
7	16 2 per cent Solids	Sp. Gravity @ 67 deg. F. = 1.080	Bé = 10.7 deg.
8	13.4 per cent, 11.5 per cent and 10.1 per cent solids	Sp. Gravity @ 67 deg. F. = 1.065—1.048	[Bé. = 9.0—6.6 deg.]
9	9.0 per cent, 8.2 per cent, 7.5 per cent and 6.8 per cent solids	Sp. Gravity @ 65 deg. F. = 1.043—1 033	[Bé. = 6.0—4.6 deg.]
10	Water		

when we are dealing with large capacities in comparsion with small capacities, but what we are primarily interested in is the greatest efficiency at the minimum cost.

How to Eliminate the Static Head

The first of all requisites is to get rid of static head. In evaporators of small capacity this subject may not assume great importance, though even there it may be appreciable. Let us assume that the pressure in the last effect is 2 in. absolute or 28 in. vacuum.

Let us assume, for instance, that in the last effect we have a static pressure equivalent to 1 in. of mercury over the lowest part of the heating surface. This static head amounts to 1.13 ft. of water and corresponds to a difference of 14 deg. F. in temperature, the difference between 2 in. absolute pressure and 3 in. absolute pressure. It will readily be seen that if only deg. F. difference of exchange is used, under these conditions hardly any heat at all will be transmitted through the lower heating surface, because the static head of 1.13 ft. of water raises the boiling point 14 deg., while we have only 10 deg. leeway and the only heat transmitted is that used in heating the liquor. In fact, if we stick to 10 deg. difference of exchange we find that only 0.79 ft. of water will correspond to a static head of 10 deg. In most solutions, however, we have a liquor of a much higher specific gravity than water. Let us assume a specific gravity of 1.3; then we find that 0.61 ft. of this solution will correspond to 10 deg. of temperature difference. Now if this difference of 10 deg. is to be maintained, we find that the depth of the bottom heating surface can be only 7.3 in. below the surface of the liquor, with the bottom heating surface hardly functioning at all. If large capacities are to be obtained, the only way of obtaining such is to increase the length and breadth, which means costly construction subject to mechanical weaknesses, with an enormous increase of radiating surface, or we may increase the heating surface by increasing the number of units, a procedure which is in its effect the same as in the first alternative.

Now let us suppose that the capacity has to be so large as to require a difference of 12 ft. between the bottom and top heating surface, and let us assume the liquor has a specific gravity of 1.3; we find this is equivalent to 15.6 ft. of water, or 13.8 in. of mercury, which corresponds to a temperature difference at the bottom of 81 deg. F.; the bottom heating surface, even with this enormous difference of exchange, scarcely functions in evaporation, though it may heat the circulating liquor, and we find the static head has made in this effect alone a difference of more than eight effects. Again, this temperature difference of 81 deg. F. corresponds to 15.8 absolute pressure, inas much as we have assumed an absolute steam pressure to the condenser of 2 in. absolute (28 in. vacuum, barometer 30 in.) which corresponds to a temperature of 100 deg. F. Now let us again, on the preceding effect, assume a static head of 12 ft. with a specific gravity of 1.25. We then have an absolute pressure of 29.1 in. (0.9 in. vacuum, barometer 30 in.), or a boiling point at the bottom heating surface of 211 deg. F., and we have lost 30 deg. F., corresponding to three effects of 10 deg. temperature difference each, and yet only two effects have been used. These illustrations show that in evaporation a large unit may be less efficient than a small unit, and thus quite different from most operations where the reverse is more apt to be true. Hence it will be seen that the elimination of all static head is desirable as one of the positive means of reducing individual temperature differences and consequently the total temperature spread.

In the above charts we have assumed a constant temperature difference, but such rarely occurs in practice—first, because most liquids tend to increase in viscosity, and second, because the amounts of heat transferred in different effects vary. The more viscous the liquor the less is its conductivity, as a rule. The reason for this is that most liquids are poor conductors of heat and that most of the heating of such is accomplished by heating the individual molecules. The greater the number of molecules coming in contact with the heated surface the greater is the heat transferred. The more viscous the solution the less is the transfer of heat, for the number of molecules coming in contact with the heated surface in a given time diminishes with increasing viscosity. Most solutions, however, tend to become less viscous as their temperatures are increased; from this fact it would appear that an evaporative process should be conducted in such a way as to neutralize the tendency to great viscosity due to concentration by an increased temperature, unless other consideration make it inadvisable. To illustrate how the vocosity may change with temperature, Fig. 3 shows a viscosity-temperature chart of waste sulphite.

The values are obtained from a Stormer viscosimeter. It will be noted from this chart that the viscosity of waste sulphite liquor up to 29 per cent varies little from that of water, and that an increase of temperature decreases the viscosity only slightly. When, however, we come to deal with a 50 per cent waste sulphite liquor, we find that the viscosity is many times greater than either water or sulphite liquor of concentrations less than 30 per cent, while at high temperatures it may be only four times that of these other liquids. The logical course of evaporation of this liquor, provided we do not have other interfering considerations, would be to have the concentrated liquor emerge from the evaporator which is at the highest temperature.

Velocity Over Heated Surfaces

It is a well-known fact that with increase in velocity over the heated surface we get an increase in heat transfer. The laboratory of the Brown Co. has already made a contribution on this subject. (G. A. Richter, *Trans.* Amer. Inst. Chem. Eng., 1919., vol. 12, Part II, pp. 147-149.) We must consider this factor when we come to evaporator design. Especially is this true when the liquor is so viscous that the only way of getting a high heat conductivity is to get a high velocity over the heated surfaces.

Specific Gravity—The same considerations which we have taken into account in relation to viscosity and velocity apply in many cases to specific gravity. Thus a highly attenuated gas, such as steam in the last effect of an evaporator (vacuum end), will move a light, mobile body over the heated surfaces much faster than a heavy viscous body, and as before stated, the greater the velocity the greater the heat conductivity.

Boiling Point—The individual temperature differences may be greatly affected by the rise in the boiling point. A 50 per cent solution containing a substance of large molecular weight may not have as high a boiling point as a 25 per cent solution containing a substance of small molecular weight. Furthermore the boiling point may be influenced by the kind o solution. If it is colloidal, the boiling point may not rise to the same extent as would be the case if we had a true solution. The knowledge of this is important, for this point alone may determine the nature of the evaporating process.

In order to avoid repetition, the effect of the rise in the boiling point on the process of evaporation will be discussed in connection with the prevention of corrosion of tubes.

Certain liquors have an acid radical which is so lightly held that long-time contact with heated surfaces may liberate the radical with the tendency to corrode the tubes. In such cases the difficulty may be eliminated either by so conducting operations that the time element may be reduced to a fraction of a second, or a sufficient amount of alkali may be added to anticipate this dissociation. The deciding factors will be cost and quality of resulting product. We have two alternatives before us: we may feed each effect of a multiple effect evaporator from a common source so that weak liquor enters each evaporator and we may take a concentrated solution from each evaporator—that is, the liquor goes through each effect in parallel instead of going through them in series—viz., from one effect to another—or we may pass the liquor through all, neutralizing it enough in one operation or in proper stages. If the rise in the boiling point is large the first method may so increase the individual temperature difference, and thus increase the total temperature spread, as seriously to detract from the efficiency. It furthermore may defeat its own ends by raising the temperature in the first effects enough to neutralize the advantage sought. If the rise in the boiling point is low, we may adopt this method without serious loss in efficiency. If the liquor is of such a nature that neutralization will be detrimental, the parallel flow method may offer a way out of this difficulty.

EXPOSITION PLANS BOOMING

WITH every mail bringing in letters indicating that the Second Paper Industries Exposition, to be held at the Grand Central Palace, New York, the Week of April 7th, 1924 will be far bigger and better than the 1923 Exposition. The first notices sent to prospective exhibitors have brought in a response that was surprising in view of the fact that the notices were sent out shortly before the busy holiday season. Paper manufacturing companies that did not exhibit last year are engaging space, and some of those that did exhibit a year ago are asking for the reservation of more space than they used at the first exposition. The replies from machinery and supply companies are especially encouraging to the management, while the returns from the container group have been such as to justify the establishment of a special section for the companies making bags, boxes, cans and special containers.

The educational side of the Exposition will be particularly worthy of note, as plans are being made for the installation of even more exhibits of this type than were included in the 1923 Exposition. Features and programs of special interest to printers, lithographers, and other large users of paper will be featured during the week, and the special features will be such as to prove of great interest to the ultimate consumer which was largely represented in the attendance a year ago.

Work is now under way toward the arrangement of special days for particular groups, as was done last year when there was a Clean Food Day, a day for the printers and other special programs. There will be some special program features every day of Exposition Week.

The Technical Association of Paper Industry will repeat its holding of a special program at the Exposition, as the association's annual convention is held during the week, and features of special interest to the paper mill superintendents will form part of the week's program, even if it is not possible to hold a special superintendents' program the latter part of the week.

FOLLOW NEPCO MILLS IN EXTENSION WORK

Success Achieved at Port Edwards and Nekoosa Mills of the Nekoosa Edwards Paper Co., Port Edwards, Wisconsin Induces Other Concerns to Introduce Courses

THE success achieved in the vocational educational work conducted through the University Extension Division of the University of Wisconsin during the past two years by the Nekoosa Edwards Paper Company is inspiring other paper mills in both the Wisconsin and Fox River Valleys to introduce similar work in their mills for their employees.

Employees of the Wausau Sulphate Fibre Company of Mosinee, Wisconsin, with the co-operation of company officials, have taken up courses similar to those now being given at Nekoosa and Port Edwards, and other paper mill concerns along the Wisconsin River may inaugurate the work at an early date.

First Class at Mosinee

At Mosinee the first class was held Thursday evening December 13th, thirty of the mill employees attending the initial meeting of a class in shop drawing and this group will meet each week to report and review the studies which are sent out by the University.

Norman Stone of Wausau is in charge of this and other classes, acting as local director. The lessons are all under supervision of the university and reports are made by each student direct. Another group for the study of electricity met Monday at Mosinee, and still another will take up "Paper Mill Work" on Wednesday the 19th.

Marshall C. Graff, of the University of Wisconsin Extension Division, has been instrumental in gaining the interest of the paper mill concerns all along the valley, and he says he believes other companies will back the movement, which has proved so helpful to the companies and to the men in the paper mills.

Fox Valley Mills Interested

The success of the paper mill study courses has attracted the attention of the paper concerns in the Fox River Valley also, and delegations were sent to Nekoosa the past week to watch the classes at work, and Judson G. Rosebush of Appleton, largely interested in the Appleton Paper Mills, made a personal visit to investibate and is planning to introduce similar courses in the Fox River Valley.

NEW REORGANIZATION OF RIORDON

Bondolders Putting Up More Money To Run Business

THE Reorganization Managers, who have been endeavoring to develop a reorganization of Riordon Company on behalf of the Shareholder interests in the company, have formally stated that this plan has been abandoned.

In part, their statement reads:

"The Plan of September 7, 1923, was formulated for the purpose of giving to the shareholders and unsecured creditors of the company an opportunity, by contributing substantially to the new money required, to participate correspondingly in the ultimate profits of the enterprise. The lack of any general response on the part of the shareholders and creditors makes it evident that they are not prepared to assume the burden of financing the reorganization."

Concurrent with this announcement comes the statement that the Bondholders, who have had much to do with the operation of the pulp and lumber mills of the company and the sale of output ever since the mills were reopened in 1921, have undertaken to formulate a new plan for the reorganization of the property.

Since 1921, the Bondholders have raised and put into the enterprise a very substantial amount of new money.

It is stated by those now in control that there will be no interruption to production and shipments of Bleached Sulphite at Kipawa and Hawkesbury Pulp Mills, which are continuing to be operated by Riordon Pulp Corporation, Limited, under lease from Riordon Company, as they have been for many months past, the output being marketed exclusively by Riordon Sales Corporation, Limited, as in the past.

Forestry in the Paper Industry

Conducted by J. R. Simmons, Secretary Forester,
The New York State Forestry Association

TO SAFEGUARD CHRISTMAS TREES

Forest Men Fear Christmas Tree Trade Will Spread Disease

A PUBLIC hearing to consider restrictions on the importation of Christmas trees and greens from Canada to guard against the possible entry with such products of the gipsy moth will be held by the Federal Horticultural Board, U. S. Department of Agriculture, at Washington, January 4th. In its notice of the hearing the Board declared:

"The gipsy moth is now known to occur in northern Vermont near the Canadian border and may, therefore, be shortly expected to invade Canada if it has not already established footholds across the line. It therefore seems necessary to make provision for the enforcement of such restrictions on the entry of Christmas trees and greens from Canada as may be deemed necessary to safeguard such entry."

As related to this hearing, a conference was held at the same time and place to consider further restrictions on the movement out of New England of Christmas trees and greens on account of the potential risk of spreading the gipsy moth which must attach to such movement. In recognition of such risk, embargoes against Christmas trees and greens from New England were issued by New York, Pennsylvania, Maryland, Virginia, Ohio, Michigan, Illinois and Wisconsin, in an effort to ward off the entrance of the gipsy moth during the 1923 holiday season.

In the case of Illinois and Wisconsin, the embargoes applied only to the area designated as infested by the gipsy moth. Other embargoes applied to all New England but were aimed particularly at trees and greens collected in the wild, i. e., not nursery grown. New York modified its embargo to permit movement from New England of Christmas trees and greens certified by the inspectors of the Department of Agriculture, on the condition that such certification should accompany all shipments whether from within or outside of the teritory designated at infested.

The hearing before the Horticultural Board brings to the forefront the whole problem of the Christmas tree industry in the Northeast. That a problem exists is recognized by the State Departments and the Forestry organizations in this region, whose offices have been abundantly circularized with protests against what is claimed to be a waste of materials greater than exists in any other industry concerned in the use of forest products. It is felt that the discussions of the Board may localize the problem by prohibiting interstate shipments, thereby obligating the individual states to solve their own problem. Thus may the loathsome pest known as the gipsy moth receive to his credit a single white mark against an otherwise very black record.

Don't overlook this department in scanning PAPER. Mr. Simmons, one of the ablest men in forestry in the land, is everlastingly fighting for the future of the paper industry.

With New York, Pennsylvania, New Jersey and Maryland getting millions of Christmas trees from New England and Canada, in addition to the quantities annually cut and wasted within their own borders, the January Christmas tree fires (which witness the destruction of the surplus supply) become almost as great a stench in the nostrils of the sensitive citizen as do the real forest fires of spring and fall.

The Christmas tree industry involves many perplexing problems, including the rights of the private timberland owner, and the income of a great body of farmers who feel that "a little thinning out will help the woodlot," and that a crop of Christmas trees harvested during the lifetime of the present tiller of the soil is equivalent to the proverbial "bird in the hand."

The Forestry Association in New York has been requested by a group of its members to consider at the annual meeting to be held Feb. 5th, the following points in relation to the Christmas tree industry: (1) Is it feasible to attempt legislation with a view to regulation of the cut? (2) Should the species that may be taken for the Christmas trade be limited to balsam only, in an effort to preserve the better lumber trees such as spruce, hemlock and pine? (3) Should Christmas trees be nursery grown, and if so, should the State Department be given an appropriation for the purpose of raising the trees in its own nurseries?

There appears to be no effort, organized or individual, to obtain abandonment of the age-old custom of erecting the Yule tree in the home at Christmas time. But there are lumbermen and pulp manufacturers among the number of citizens who believe that the waste of young coniferous trees in the Christmas tree industry is practicaly offsetting the combined efforts in reforestation in many of our states.

Record Ballot on Forest Policy

That the nation is taking a constantly growing interest in forestry is shown by the manner in which the United States Chamber of Commerce referendum on a forestry policy received attention from the Chamber's membership. The number of ballots cast on the referendum has only been exceeded four times in the chamber's history, and not at all since 1917. Three states voted 100 percent of the membership, twenty-two states voted over 66 percent of the membership and only seven states returned a vote of less than 50 percent of their membership in the chamber.

PORTER IS HUSTLING

Report of Three Years of Activity Reveals His as Doing Things

O. M. PORTER, Secretary of the Woodlands Section of the American Paper and Pulp Association, making a report of three years of activity of the Section, gives a list of important projects which the Section has undertaken, and makes some important recommendations as to future activities for the benefit of the men in the Woodlands end of the paper industry.

The purposes of the Section are:

1. To increase the efficiency of the woods operations of the pulp and paper industry.
2. To encourage the practice of forestry on timberland holdings.
3. To provide a medium for the gathering and dissemination of information which will promote the permanency of the woods operations of the pulp and paper industry.

Following is a partial list, by general subjects of the information which the Woodlands Section has developed for its members:

A—Forest Operations

1. Economy of four feet vs. long log operation.
2. Tugs and booms for open water towing.
3. Methods of sorting four feet pulpwood.
4. Brush disposal.
5. Volume losses from barking.
6. Driving birch and poplar pulp wood.
7. Peeling practices for Southern pine.
8. Shrinkage in cutting up sixteen feet logs.
9. Shrinkage on drives and in storage.

B—Forest Protection

1. The spruce budworm; identification and methods of control.
2. Timberland Insurance.
3. Fundamental forest education.

C—Forest Investigation

1. Forest Investigations; What, Where and by Whom.
2. Number of sticks per cord.
3. Pulpwood decay.
4. Cubic feet space of piled pulpwood.
5. Adirondack spruce increment.
6. Reforestation; methods, costs and yields.
7. Forestry for the paper industry.

D—Statistics

1. Quarterly pulpwood reports.
2. Imports of pulpwood and woodpulp.

The Section feels that the paper industry could well afford to finance its activities as a clearing house for information on woods operations, especially along the following lines, which the Section's limited funds now enable it to handle only partially, if at all:

1. Forest Protection

Fire, insects and fungi.

Methods and costs, by regions and types.

2. Forest Management

Practical working plans.

3. Forest Taxation

Legislative relief.

4. Reforestation

Methods, costs and yields.

5. Woods Operation Costs

6. Logging and Driving Operations

New methods and machinery.

7. Special Investigations

Pulpwood decay, pulpwood supplies, etc.

"The paper industry must pay more attention to its wood operations," says Mr. Porter in summarizing the Section's work. "The Woodlands Section can serve the industry in keeping it informed, in preventing duplication in its woods experiments, and in correlating the data collected by all the several agencies now interested in woods operations and woods investigations."

Moss is Important

A study of the use of moss in forest nurseries by Dr. A. Cieslar of Mariabrom, Austria, has been sent to members of the Woodlands Section of the American Paper and Pulp Association by Secretary O. M. Porter. Dr. Cieslar finds that plants taken from beds which are not cultivated, covered or watered are in every sense the poorest. The best plants are those taken from beds where the interstices are covered with moss. The cultivation of the beds is more important than watering. A covering with moss 5 cm. deep and not more, favors growth as much as watering, cultivating and weeding combined. Percentages of volume production of seedlings by various methods of treatment are as follows: Watering alone, 15 percent; cultivation alone, 39 percent; moss cover alone, 45 percent; moss covering kept moist, 64 percent.

Canadian Foresters Agitated

Canadian foresters are greatly agitated over reports that the University of Michigan has been making advances to secure Dr. Clifton D. Howe, head of the forestry department of Toronto University as head of the forestry department of the Ann Arbor institution. "They would have to hold out to me a tempting inducement before I would think of giving up my work here," said Dr. Howe at Toronto; and one comment from the Canadian foresters is to the effect that it would be a "national calamity" to allow him to return to the States.

Vinnedge Gives Address

The annual address by a prominent lumberman before the Yale Forest School was given this year by R. W. Vinnedge, of North Bend, Wash., vice president of the National Lumber Manufacturers Association, his subject being "The Genesis of the Northwest Lumber Industry and Its Development." The annual lumberman's address is provided for by a special endowment by the lumber industry to the Yale school.

Depletion and Growth In The Western States

SOME important figures on reproduction of timber in the far west, and the amount of timber now available have been prepared for the United States Senate Reforestation Committee by the Western Forestry and Conservation Association. According to the Association, the present annual depletion of merchantable timber by cutting and fire in percentages of the present timber stand is estimated as 0.7 per cent for California; 1 per cent for Oregon; 1 per cent for Montana; 2 per cent for Washington, and 1.4 per cent for Idaho.

Fire prevention expenditure in 1922, outside of National Reservations, aggregated $1,944,643, of which $1,530,886 or 79 per cent of the total, was expended by private agencies; $292,232, by state and $122,525 by Federal.

In the California redwood region, companies which cut more than half of the timber produced have adopted a reforestation policy, others are considering adopting this policy, and only 15 per cent of the production has failed to take an interest in reforestation.

In the California pine region, about 90 percent of the operators have cooperative arrangements with the forest service for the protection of their lands. A movement is also under way to secure tax laws which will permit reforestation as a profitable venture.

The states of California, Oregon, Washington, Idaho and Montana contain hardly a fifth of the potential forest land of the country, according to the report. But much of this forest land is by far the most productive of the country—yielding three, five and even seven times the average for the country in board feet of new growth per acre, per annum. The importance of the region as a permanent national woodlot is therefore out of proportion to the acreage, just as is the present timber stand and present cut.

Oregon now contains more standing timber than any other state of the country. In the report the following figures are given for the present timber stand and rate of growth in that state:

Present Timber Stand in Oregon

M. Feet, B. M.

Commercial Species	Private	State	Federal	Total
Western yellow pine	34,054,746	100,648	41,394,365	75,549,759
Douglas fir	137,456,274	405,242	107,935,540	245,797,056
Others	36,536,787	98,000	37,794,627	74,429,414
Total	208,047,807	603,890	187,124,532	395,776,229

The total timber stand in California is given as 284,505,000 M feet; and in Washington, 282,645,481 M feet.

Rate of Growth

Average period required to produce a 12-inch tree:

	Years		Years
Douglas Fir	50	Western Hemlock	65
Western Yellow Pine	90	Western Red Cedar	55
Sitka Spruce	45		

Average yield per acre of 12-inch trees or larger, B. M. in:

	40 Years	50 Years	60 Years	70 Years
Douglas Fir	12,000	21,500	32,000	41,500
Sitka Spruce	20,000	32,000	45,000	57,000

Average annual rate of wood production per acre for various types considering the volume of the entire trees in cubic feet:

Douglas Fir	Western Yellow Pine	Sitka Spruce
150	30	160

Brompton Company Buys Timber Limits

Several deals involving the purchase of large tracts of timber are reported from Quebec. The Brompton Pulp and Paper Co. has bought the timber limits of the B. C. Howard Company at English Lake in that province, the price being in the neighborhood of $1,000,000. The tract consists of 25,000 acres of free-hold land in Canada and the controlling interest in 40,000 acres of free-hold in the state of Maine. This purchase assures to Brompton between 4,000,000 and 5,000,000 cords of pulpwood, and it is believed that with scientific reforestation its supply will be pratically unlimited.

Add To Timber Limits

The Belgo-Canadian Company has also added to its timber limits through the purchase of several blocks of wood lands in Northern Quebec. This company already had in its own right 15,000 acres of free-hold timber limits and controlled about 1,800 square miles of leasehold limits containing about 6,000,000 cords of pulpwood. The additional purchases are believed to have added from six to ten years to the life of the company's limits. The purchase of about 30,000 cords of pulpwood during this year has already relieved the company of the necessity of cutting that much wood from its own limits.

Buys Timber Limits

The report is current that the St. Maurice Paper Company, head office, Montreal, has purchased some 500 square miles of timber limits on the St. Maurice River, estimated to contain 150,000 cords of pulpwood, from the parent company, the Union Bag and Paper Company. The initial payment will be in the form of 2,500 shares of St. Maurice stock, while future payments will be made in cash over a term of years to a total amount not stated, but which, it is thought, will be about a dollar per cord stumpage, or about $1,250,000. The limits in question are Crown lands, from which the Union Bag Company could not export pulpwood and upon which the St. Maurice Company had already done some cutting.

Comminuting Paper Pulp

Words of Wisdom for Mills Which Must Purchase Pulp for Paper Making

THERE are many mills which do not make their own pulp but purchase by contract or otherwise. A great deal of pulp is imported into this country. The condition in which this pulp generally comes to the mill is such that it requires treatment before it can be properly beaten into condition to be used on the papermaking machine.

There are various ways in which the "laps" of pulp, or tough thick sheets which closely resemble cardboard, are handled. Thus, for example, they may be fed by hand directly into the beater where the comminuting action of the beater roll and bedplate reduces them into increasingly smaller pieces until the individual fibers are separated and finally isolated so they can receive heating action.

While this method appears quite simple, it possesses many disadvantages which detract from its apparent simplicity. It is necessary to convey the pulp to the beater in trucks and it must be fed into the beater by hand thus consuming considerable time and labor. Care must be exercised in introducing the pulp into the beater, for if too much is fed to it, the beater roll is apt to jump and damage may be done to the beater knives. Furthermore, it must be remembered that the primary object of the beater is to beat up stock and not to break up hard, tough rolls or slabs of pulp. There is no doubt that when a beater is used for this purpose, the output is curtailed. There is also still another difficulty in that the wires or other fastenings that are used to secure the bales of pulp may escape the attention of the man feeding the beater and may do considerable damage.

Use of Kollergangs

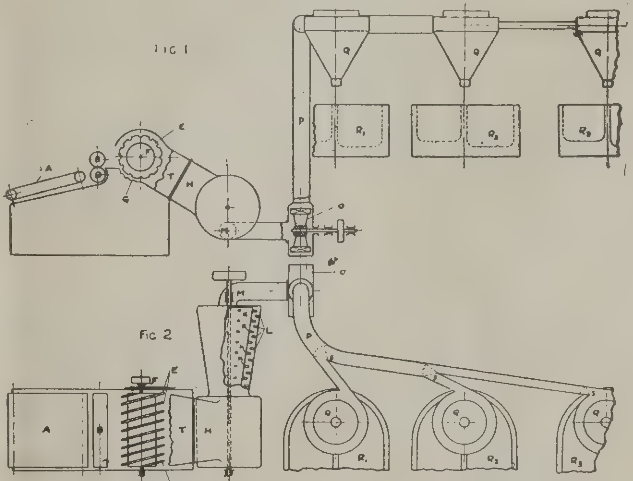
Kollergangs or edge runner mills may be used for obtaining the pulp preparatory to its introduction into the beater. This process is, however, intermittent and is generally avoided except where the quality of the finished paper is such that it repays the manufacturers for the time and expense involved in operating these machines.

It is also rather common practice to put the slabs of pulp through a pulper in which the pulp is moistened with hot or cold water. The material comes out of the pulper in the form of moist balls which are immediately taken to the beater and fed directly into the machine by hand. The disadvantage involved in the use of the pulper is that this machine is usually of small capacity, as one ton of pulp an hour is considered to be a fairly high figure. Moreover, it occupies considerable space and consumes a rather large amount of power per unit weight of pulp delivered by it. Then, again, as the stock that emerges from the pulper is very moist, it must be carrried to the beaters in trucks and fed to them by hand. This is accordingly an operation which consumes considerable time and is costly. Lastly, the handling of wet stock always tends to soil it and depreciate its value.

New Process

A new process which is patented in British patent No. 202,575 is designed, according to the inventor, to overcome these difficulties and disadvantages and to provide a means whereby a battery of beaters can be supplied individually at will with comminuted pulp in a suitable condition for entering the beater from a common central store without the use of manual labor.

The apparatus and its arrangement are shown in the accompanying diagrams. The slabs of pulp are fed to a continuous conveyor A. This belt carries them between two feed rollers B, whence they are cut between the obliquely set saw blades E which revolve on the shaft F and engage with stationary knife edges or teeth at G. The action of these is to tear the slabs into irregular shaped pieces which emerge from the orfice T.



The pieces of pulp then fall into the hopper H of a disintegrator fitted with revolving pins K and stationary pins L. The object of these pins is to break up, knead or comminute the pulp so that it emerges at the point M in quite small pieces which are suitable for being handled by a pneumatic blower at O which blows them through the pipe line P and air separators Q into the beaters R^1, R^2, etc.

In the pipe line P there are provided valves S so that the supply of comminuted pulp can be directed to any beater.

Advantages of New Process

There are very evident advantages of this system over those commonly employed. The only labor that is required is that of feeding the slabs of pulp to the traveling belt. The remainder of the process is entirely automatic. No trucks or other mechanical conveyors are required. It is also important to remember that the pulp is treated without the addition of moisture and this makes it possible to blow it through the pipes without any danger of clogging them. Furthermore, the dry pulp is not nearly so prone to become soiled and dirty as wet pulp.

The beater is used in this process for the exact purpose for which it was designed, that is for beating the pulp to bring it into condition for use on the paper making machine, and not for the purpose of breaking up hard lumps of pulp for which it was not at all intended. Time is not lost in this operation and the output of the beaters is at a maximum.

The large pieces of pulp are ground up in the saw mill and disintegrator and the pulp is perfectly comminuted when it enters the beater. This might not be the case if the saw mill alone were used. If the slabs of pulp were first fed directly to the disintegrators, time would be consumed in grinding up the large lumps, whereas these are reduced to proper size in the saw mill for treatment in the disintegrators. It is far better practice to work with both a saw mill and disintegrator as the beaters are thus kept plentifully supplied with ground pulp and the capacity of installation in maintained at 100 per cent. It has been found by experience that the disintegrators cannot handle the large slabs of pulp with good efficiency.

Capacity of Installation

The capacity of such an installation is interesting. A single saw mill with a single disintegrator and single blower will adequately maintain in operation a battery of six half-ton beaters and supply them with properly comminuted wood pulp at the rate of over four tons of pulp per hour. There is a very great saving effected in both labor, time and space and the finished pulp is of such a high quality that a very good grade of paper can be manufactured from it. Another advantage is the high degree of cleanliness of the pulp.

It is stated that this process possesses a particular advantage in connection with the manufacture of newsprint and other paper which does not have to be beaten in the true sense of the word. The individual fibers of the pulp must only be separated from one another. In making this kind of pulp the slabs of pulp are simply fed into the saw mill and after comminution there and in the disintegrator as described, the pulp may be blown directly into large mixing vats. There the comminuted pulp is diluted with water and passed through one or more continuous operating refiners. After treatment in the refining engines the pulp is ready for manufacture into newsprint on the paper making machine. Sizing materials, weighting substances and colors may be added directly in the mixing vat.

This process is continuous instead of intermittent as is the case where breakers or beaters are employed to break up the pulp. The advantages of this process as applied to newsprint manufacture are apparent, time, space, labor, and power being saved.

In some cases it is advantageous to insert a coarse screen or retaining baffle at the inlet or outlet of the disintegrator. This screen is made in the usual manner and serves to catch any pieces of wire or other foreign bodies which may be mixed with the pulp. This system of comminuting the raw material before introducing it into the beater may also be applied to the treatment of waste paper or boards.

The description of this patent is taken from the original patent specifications and from *Paper Making and Paper Selling*, October 1923.

Paper Man Addresses Civic Association

Walter F. Denicus, receiver for the Myers Pulp and Paper Manufacturing Company of Denver, Colorado, addressing the Denver Civic and Commercial Association, told of the efforts being made to improve the output of the paper mill, but added that it was very necessary to have the cooperation of the entire citizenry, that is, in the saving of all cast off paper which was necessary in the making of box board.

The speaker called the attention of the business men to the fact that they were throwing away thousands of dollars yearly by burning in their furnaces the refuse paper about their places of business.

Colorado Incorporation

The Echo Publishing Company has incorporated; capitalization $10,000. The incorporators are Winona Flavin, Sam T. Green and Mildred Johns. Seat of business Denver, Colorado.

Sweden's New Regulations

Sweden has recently promulgated a new forestry law which brings into force better measures of preservation and sets up restriction against extreme exploitation, say Consular advices.

In some parts of Sweden the proprietary rights of the owners of private forest have been limited by spcial laws and the forests in these districts have been well preserved, but on the whole the forests have been threatened by excessive felling. It is therefore hoped that the new law will fill the long-felt need. The farmers alone have criticized the measure basing their criticism upon the regulations pertaining to the protection of young forests.

Stopped from Taking Office

Supreme Court Justice Edward N. Smith has granted a temporary injunction in the case of Jeremiah T. Carey against M. H. Parker and others. Restraining Parker from taking office as president of the International Brotherhood of Paper Makers before settlement of the present action.

Mr. Parker, of Richmond, Virginia, recently was elected president of the Brotherhood by a recount in which Mr. Carey charged 600 votes for him were cast out.

Changes at Dill & Collins

Several important changes have taken place in the personnel of Dill & Collins Company.

Mr. Howard W. Taylor has resigned as vice- president.

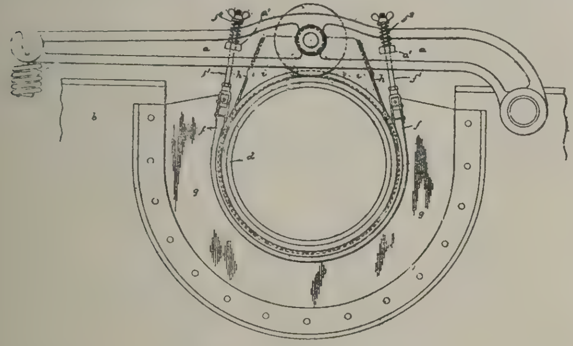
Mr. Herbert W. Mason, of Boston, late treasurer of the S. D. Warren Company, will join our official family as vice-president, on January first, 1924.

New Developments in Paper Making

Paper Pulp Straining Machines

British Patent No. 203,927 is concerned with the construction of paper pulp straining machines of the rotating drum type, wherein the drum is partially immersed in the pulp vat, and wherein the pulp, in its passage through the straining medium, flows inwardly. The improvements which are described in this patent, while primarily intended for use with the inward-flow drum-strainers, are applicable to the drum-strainers of the outward-flow type.

In inward-flow machines it is necessary to provide means for closing the opposite ends of the pulp-vat against the escape of the pulp otherwise than by way of the drum-tank outlet. For this purpose it has been proposed to employ diaphragms formed of flexible material, one edge of which is attached to the pulp vat, while the other edge is attached to a semicircular ring arranged beneath the drum outlet. This ring is furnished with a face-packing which bears laterally against a flange depending from the drum or from a ring in which each end of the drum rests in the vibrating cradle-arm.



Upon a vibratory movement being imparted to the drum the face packings slide upon flange surfaces, while the flexibility of the diaphragms provides for any slight longitudinal movements to which the drum may be subject. It is also usual with inward-flow strainers to hold the drum down in its cradle-arms by providing each of the said arms with a saddle bar. These saddle bars pass over the respective drum trunks and counteract the tendency of the drum, owing to its buoyancy, to rise in the pulp vat. The drum is slowly rotated and is subject to rapid vibrations. On the other hand the means for supporting, rotating and vibrating the drum can be designed in various ways. Saddle bars are used for holding the drum down in the pulp vat. Rubbing packings of the face joint type employed for the purpose of preventing leakage due to the vibratory movement of the drum are not required in this apparatus.

Pitch of Wire in Paper Making Machine

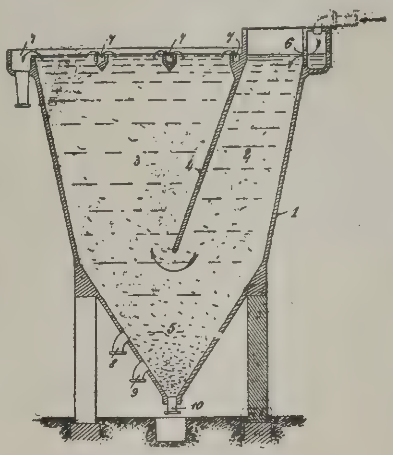
United States Patent No. 1,477,020 is assigned to the Rice, Barton and Fales Machine and Iron Co. The machine that is described in this patent has a Foudrinier wire which is carried on a frame, which also carries suitable rollers including a breast roll on which the wire runs. Means are provided for supporting this framework whereby its position may be altered to change the pitch or inclination of the wire. Means are also provided for supporting the breast roll from this frame so that the roll may have endwise shaking movement relative to the latter. Lastly, means are provided for imparting an endwise shaking movement to the breast roll relative to the frame and thereby shaking the wire with the roll.

Improvement in Paper Making Machine

The paper making machine, improvements in which are patented in United States Patent No. 1,476,894, consists of top and bottom press rolls and a conveyor suitably mounted and adapted to carry the pulp between these rolls. A hopper is provided which is mounted pivotally and provided with a scraper to rest upon the top press roll. Means are furnished for passing into this hopper a suitable quantity of water to act as a carrier of the pulp. The hopper carries adjustable weights.

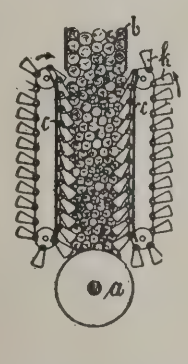
Save-All

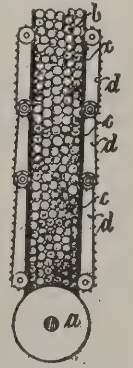
French Patent No. 559,749 is concerned with the design of a save-all. The process of recovering pulp values from waste waters of all sorts consists in making the liquors pass through a decanting device in such a manner that the speed of the same is constantly decreased from the moment that they enter the apparatus to the time that they leave it. This, progressive diminution in the speed of the liquor results in the deposition of the pulp contained in the liquor in the bottom of the decanting device. The figure shows the manner in which the apparatus is constructed. The apparatus is made in the form of a cylindrical tank which tapers off in its lower part to a cone-shaped affair. The upper part of the apparatus is divided into two parts by the baffle *4*. The liquor enters at *6* and is distributed over the surface of the apparatus by a distributing device and leaves at *8* and *9*.



Feeding Device for Wood Grinders

German Patent No. 369,088 is concerned with a device for feeding wood to grinders in a steady stream. It has been observed in the operation of grinding machines in which certain devices were used for gripping the wood for feeding the same to the grind stones, that only those pieces of wood that are in direct contact with these devices are effected, that is are given the desired pressure against the stones. The pieces of wood in the center of the column being fed to the stones are not subjected to the same pressure as those in direct contact with the walls of the feeding shaft. The object of this patent is to avoid these difficulties by increasing the pressure on the pieces of wood in the middle of the mass being fed to the grinders, which is done by increasing the pressure as the column of wood nears the stones. The immediate effect of this is to increase the friction between the individual pieces of wood with the result that this pressure is transmitted to the pieces of wood in the middle of the column with the final result that these pieces of wood are pressed against the stones with as much force as those nearest the device which is exerting the pressure.



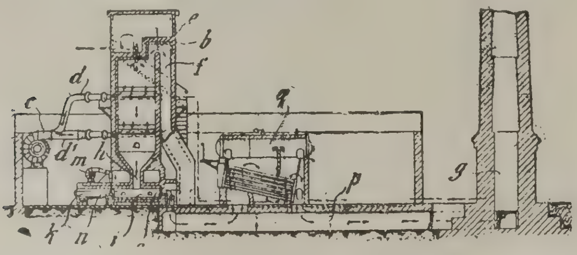


The apparatus for accomplishing this is seen in the figures. The simplest form is shown in the figure where a simple endless chain device is employed. This chain device is made in several parts which renders it possible to increase the speed of any part at will. Thus for example the speed of the part *d* can be independently increased of the others. The way in which the apparatus is operated is to run the lowest section of the chain conveyor at the highest speed and decrease this speed in the other sections in order. This results in a gradual increase in pressure which is transmitted to the wood in the center of the column.

Another method of carrying out this idea is seen in the figure to right. The bars attached to the chain engage the pieces of wood and exert both a downward and lateral pressure against them.

Evaporation of Sulphate and Sulphite Liquors

German Patent No. 347,865 is concerned with an apparatus used for evaporating sulphite and sulphate cellulose waste liquors. The apparatus is shown in the accompanying figure.

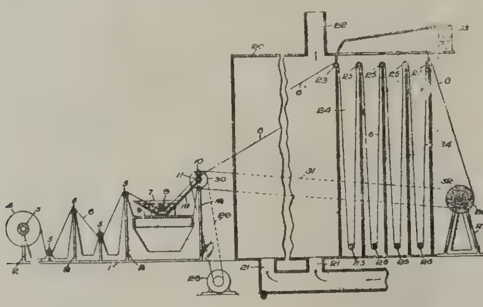


The liquors are partially concentrated by blue gases and are completely evaporated by the heat developed in a firebox. The solid residue is burnt by the admission of air. The figure shows the concentration chamber at *b* in which steam and the flue gas and liquor travel in opposite directions. The evaporated liquor is received at *i*. The firebox is seen at *k*.

Colored Paper

United States patent No. 1,475,923, which is assigned to the Royston Paper Co., is concerned with both a process and apparatus for the manufacture of colored papers.

In the illustration at the extreme left there is seen the roll of uncolored paper which is drawn through the calender rolls 5 and given a thorough ironing out so that the paper surface is absolutely smooth. The paper then goes through a dye bath. After leaving the dye bath which is of the ordinary kind the paper passes between a number of hard-surfaced pressure rollers and enters a box which is heated with hot air. This drying box is seen at the extreme right of the apparatus. The paper travels free while passing through this box, not coming into contact with any supporting surface while it is still wet with the dye. The paper is hung up in festoons is seen from the figure. After the paper leaves the drying box it is rolled up.



The driving arrangement is made in such a fashion that the strip of paper is fed through the apparatus at a constant rate of travel.

Grease and Water Proof Paper

United States Patent No. 1,476,562 is concerned with a process for rendering paper material both grease and waterproof. This is accomplished by using a grease proofing composition of the regular sort which is afterwards coagulated with the aid of acetic acid fumes to render the same moisture-proof.

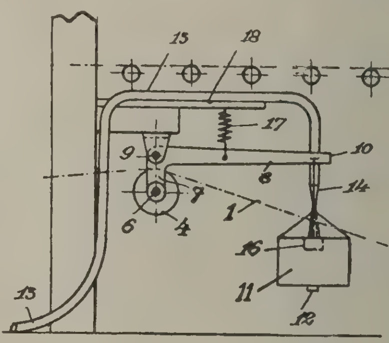
Arrangement for Maintaining Correct Position of Wire

German Patent No. 380,549 is concerned with a device for setting the traveling Fourdrinier wire in the correct position and maintaining it there during the course of its travel. The diagram shows this device. One end of the guide roll 4 is carried in the bearing 6, which is held in the arm 7 of the bell crank 8. The latter swings about the pivot 9. A vessel 11 hangs on the other arm of the bell crank, the arm 10. This vessel has an opening in the bottom which can be easily regulated. The traveling wire is seen at 1 and the mouthpiece 14 of a pipe is arranged obliquely with respect to the motion of the wire. Water passes through the pipe 13 and streams from the nozzle 14.

Under normal conditions the stream of liquid which flows from the nozzle 14 hits the edge of the traveling wire 1 in such a manner that half of the stream of liquid strikes the surface of the wire, while the other half flows away without coming in contact with it, being shunted off by the edge of the wire. This part of the liquid flows off through the channel 16 in the vessel 11.

The outlet 12 in the vessel 11 is arranged in such a manner that when the wire is moving past the same in a normal position the same amount of liquid enters and leaves the apparatus. The level of the liquid in this vessel is therefore constant under normal operation. Hence the effect of the weight of the water on the lever arm 10 is also constant.

The arm 10 of the bell crank lever is also subjected to the pull of a spring 17, one end of which is fastened to a rigid part of the machine. This is fixed in such a manner that the bell crank 8 remains in equilibrium as long as the wire runs in the correct path, that is, the axis of the guide roll 4 is perpendicular to the direction of travel of the wire.



The apparatus works in the following manner. If the wire is shifted in its position more to the anterior part of the machine, the amount of water entering the vessel 11 is decreased. Inasmuch as the same quantity of water flows out of this vessel, the weight of the water in the same is lessened and the spring 17 tends to raise the arm 10. This means that the anterior end of the roller 4, which is held by the lever arm 7, is moved towards the right and hence the wire is made to come back into its correct position by the action of the guide roll on it.

Bleaching Paper Pulp

Paper pulp is bleached by means of an agent containing active chlorine. The excess of the latter is subsequently destroyed or neutralized within the pulp. The pulp is afterwards acidified. This process is patented in United States Patent No. 1,468,693.

Want to Standardize Paper Hat Boxes

As a result of the recent meeting of hat manufacturers, the movement for standardization of paper boxes for hats has received added impetus. Harry McLachlan of Danbury, Conn., president of the National Association of Hat Manufacturers, has been actively at work to attain this result. Dealers have recommended that hats be shipped four in a box, such a box being the most convenient size for handling and storage. The hat manufacturers will probably adopt standard sizes at their next annual convention. Such a plan would increase production of manufacturers of the paper containers and would also result in the more prompt delivery of orders for such boxes from the manufacturers.

Doings in Canadian Paper Field

FARMERS OPPOSE EMBARGO

Claim They Held Money From Harvest To Keep Them Going

AT their recent convention the United Farmers of Ontario endorsed the attitude of certain settlers in the Rainy River District of Ontario, to the effect that there should not be an export duty placed on pulpwood, as these settlers need the harvest from the forests to keep them going until the land can be brought under cultivation, and the Canadian Pulp and Paper Association has presented a statement which brings out some interesting facts in connection with Canada's forests. The Associations asks for the imposition of such an export duty in the interests of keeping Canadian wood at home. It is pointed out that the present rate of depletion of the Canadian pulpwood forests is ruinous to the future of the industry, and, therefore, to the permanent interests of the country. It is also felt that the depletion can be materially reduced, without hardship to any Canadian interest or any injustice to any interest whatever, and the future of the industry be thereby secured, with great benefit to the economic position of the Dominion.

The Association's statement points out that the American interets which are getting a large share of Canada's pulpwood, have made as light as possible of the depletion of the Canadian forests and in 1920 they presented an estimate that the Province of Quebec alone contained a stand of 608 million cords of wood, and that 24,320,000 cords could be cut annually without depletion, if it were conducted as a scientifically-lumbered forest. Exact statistics are not available as to the total amount of pulpwood in Canada, nor the rate of its diminution or destruction by cutting or fire, but there is an estimate set forth by the Department of Interior, of recent date, which puts the total stand of merchantable timber of every kind of soft wood at 871,720,000 cords for the whole of Canada. But of this only 65 per cent can be utilized at present, leaving a total of about 580,000,000 cords in the whole of the Dominion. Unfortunately a large proportion of this stand is not part of the "scientifically-operated" forests but is simply a reserve for the future, the utilization of which cannot take place until the cost of securing wood in more accessible areas has become a good deal higher.

So far as the consumption of the forests is concerned, the statement points out that "in sum, the rate of cutting pulpwood forests is considerably in excess of what natural reforestation can offset, having regard to the limited area in which natural replenishment can take place, and that in addition to this exhaustive cutting, which alone would suffice to produce a grave shortage of pulpwood within the life-time of the present generation, there is a further source of depletion from fire. It is obvious that this process cannot go on without paralyzing in a few years the operations of many of the plants engaged in the pulp and paper industry, and so raising the cost of operation to nearly all of them as to deprive this country of its present invaluable advantage over its competitors in the United States and Northern Europe.

To Renew Its Sittings

The Canadian Pulp Wood Commission will renew its sittings on January 14th at Port Arthur, Ont., and from thence will proceed to North Bay and Sault Ste Marie. A three-day sitting will be held at Cochrane, Ont., on January 24, 25, and 26th. In March sittings will be held in Quebec and there will be a sitting at Edmunston, N. B. In April, the Commission will leave for Winnipeg, Regina, and several other places, going finally to British Columbia.

Cease Work for Season

Work for the season on the townsite being constructed by the Spruce Falls Company, Limited, pulp manufacturers, at Kapuskasing, Ont., near Cochrane, has practically ceased. E. J. Jones, general manager of the company, who was in Toronto recently, stated that excellent progress had been made, with the result that there are now 91 new houses and 19 other houses that have been moved from other locations. The company have just completed a fine new community hall in which is a large assembly hall, rest and recreation rooms, gymnasium and billiard parlor and this building will be ready for occupancy by the first of the year. The Kapuskasing Supply Company and the Imperial Bank have also put up buildings. The Spruce Falls Company are running to capacity turning out 100 tons of sulphite pulp per day.

CANADIAN REPORT ON EXPORTS

Pulp and Paper Exports Valued at More Than Twelve Million, Report Says

The report issued by the Canadian Pulp and Paper Association states that the total exports of pulp and paper from Canada in November were valued at $12,197,577. This was slightly below the value for October exports but was an increase of $771,579 over November 1922.

Exports of paper in November were valued at $8,373,679 and exports of pulp at $3,823,898.

Details for the various grades are as followes:

	NOVEMBER, 1922		NOVEMBER, 1923	
PAPER:	CWTS.	VALUE	CWTS.	VALUE
Newsprint	2,063,900	$7,684,709	1,890,633	$6,733,078
Book Paper	3,263	25,535	2,399	16,778
Writing Paper	1,838	19,392	663	12,901
Other Paper & M'frs.		644,043		468,029
		$8,373,679		$7,230,786
PULP:				
Mechanical	671,196	$1,206,940	659,215	$ 997,007
Sulphite Bld.	269,095	1,091,222	253,713	1,074,864
Sulphite Unbld.	275,748	765,240	527,962	1,205,781
Sulphite	244,010	760,496	290,911	917,650
	$1,460,049	$3,823,898	$1,731,801	$4,195,212

Pulpwood exports in November amounted to 68,943 cords valued at $739,943 which was a considerable decline from the previous month when the quantity exported was 102,138 cords valued at $1,078,707.

For the twelve months ending November 30th, 1923, there was an appreciable gain in the value of pulp and paper exports over the twelve months ending November 1922. Exports of paper in this period were valued at $92,589,172 compared with $74,319,655, an increase of $18,269,516 and pulp exports at $46,790,411 compared with $41,630,201 an increase of $5,160,210, giving a total increase in value of $23,429,726.

Following the details of exports for the twelve months ending November 30th, 1922 and 1923.

	1922		1923	
PULP:	CWTS.	VALUE	CWTS.	VALUE
Mechanical	6,443,012	$9,524,488	6,937,791	$11,707,962
Sulphite Bld.	2,989,475	12,158,761	3,140,646	13,506,350
Sulphite Unbld.	4,239,891	10,749,893	4,498,153	12,165,135
Sulphate	2,984,587	9,197,059	2,897,127	9,410,964
	16,656,965	$41,630,201	17,473,717	$46,790,411
PAPER:				
Newsprint	18,933,376	$67,943,074	22,572,880	$84,595,637
Book Paper	31,352	227,391	47,642	350,529
Bond & Writing	12,773	138,469	23,237	240,091
Wrapping	359,403	2,733,521	407,193	3,046,989
Other Paper & Mnfrs.		3,277,201		4,355,926
		$74,319,656		$92,589,172

The exports of pulpwood in the twelve months ending November 1923 amounted to 1,416,558 cords valued at $13,746,475 which was an increase of 45 per cent. over those for the corresponding period ending November 1922 when the quantity exported amounted to 971,976 cords valued at $10,003,526.

Companies Get Together

Another big deal in Canadian pulp wood limits is that put through between the Union Bag and Paper Co. and the St. Maurice Paper Co., the former's Canadian subsidiary, by which St. Maurice has acquired 500 square miles of limits on the St. Maurice River, Que., which are estimated to contain 1,250,000 cords of pulpwood. It is understood that the initial payment is to be made in 2,500 shares of St. Maurice stock, and that the others will be in cash over a term of years. These limits are Crown lands, from which the Union Bag and Paper Co., could not export pulpwood, and on which the St. Maurice Co. has already done some cutting. This is considered good business for St. Maurice for it looks as though it is paying about $1,500,000 for 1,250,000 cords of wood that may be worth to it from $6 to $10 per cord. The position of this company has been greatly improved during the last year, due partly to the increase of $5 in newsprint prices and to the stronger demand and better prices for groundwood pulp. It is thought probable that the output of newsprint will be increased by at least one new machine, which would bring the company's daily output up to 200 tons. The foregoing transaction has revived talk of the possibility of another big merger of pulp and paper companies operating in the St. Maurice Valley. In the meantime it will not escape notice that while Union Bag has sold large valuable timber limits, it has also increased considerably its holdings of St. Maurice stock.

Weather Bucks Operators

The absence of snow in Northern Ontario and the continued mild weather has resulted in considerable difficulty being experienced by pulpwood operators in getting out their shipments. Settlers who have wood piled in the bush have been unable to haul it to the railway stations for shipment until there is a sufficient fall of snow for sleighing. One large Toronto concern which has contracted for 60,000 to 70,000 cords for delivery during 1924 and should now be sending out 18,000 to 20,000 cords a month is only shipping from 1,500 to 2,000 cords owing to the vagaries of the weather. With the advent of colder days and more snow, shipping conditions in the pulpwood line would be ideal as the car service is excellent.

To Double Capacity

The Port Arthur Division of the Provincial Paper Mills, Limited, head office Toronto, will double its capacity of the present groundwood mill from 20 to 40 tons of groundwood per day, it was announced by General Manager A. G. Pounsford at Port Arthur a few days ago. The contract for the wet machine had been awarded to the Port Arthur Shipbuilding Company for delivery as early as possible. The General Electric Company tender for electrical equipment has been accepted. Arrangements by contract have been made for an additional supply of hydro-electrical energy amounting to 1,500 horsepower, which will be turned into the new department early in the spring.

Short Newsy Items

The Nova Scotia Wood Pulp and Paper Company, with mill at Charleston, N. S., may enlarge the capacity of the plant in the spring. At present the daily capacity is about thirty tons of wood pulp. If plans mature it is likely that an extension to the plant will be started, and the production increased materially.

The mills of the Canada Paper Company at Windsor Mills are being operated to capacity. At present forty-five tons of newsprint are being produced daily. Fifty tons of groundwood pulp are also being produced daily, and also fifteen tons of wrapping and fifteen tons of specialties and colors. Although not one of the best known of Canadian pulp and paper industries, this company has at all times been active. The pulp mill and the paper mill are in close proximity at Windsor Mills and indications are that further building will be started in the spring, it being the intention to enlarge the capacity of the paper manufacturing plant. At a recent meeting of the stockholders the following officers and directors were selected: J. G. Kilgour, president; F. W. Molsen, Sir Montagu Allan, Sir Herbert Holt, C. R. Hosmer, members of the directorate; H. B. Donovan, sales manager; F. J. Campbell, general manager.

Extension of the pulp and paper mills located at St. Raymond is being considered by the St. Raymond Pulp and Paper Company. This company is controlled by Lord Atholstan. Much of the product is sold to the Montreal Star. About fifteen tons of groundwood pulp and twenty-five tons of newsprint are produced daily at this Pulp and Paper manufacturing plant.

The Hearst publishing interests are said to be contemplating the purchase of some additional pulpwood areas in eastern Canada, the gist of the reports being that the intention is to build a small paper mill that would produce about twenty-five tons of newsprint daily. Representatives of the Hearst interests are said to have looked over the lands and to have taken an option. The Hearst interests already own considerable pulpwood lands in eastern Canada.

Bay Sulphite a Bankrupt

A petition in bankruptcy was presented by attorneys in Quebec City a few days ago, acting as counsel against the Bay Sulphite Company, with head office in Montreal, but operating in the Lake St. John district and Gaspe. The petitioners are Messrs. Bouchard and Lepage, contractors, and the claim bringing the petition is for an amount of $22,000 said to be owed for the cutting of timber in Chandler, Gaspe. The registrar in bankruptcy granted the petition, which is returnable on the 31st inst. Following this first procedure another petition was presented by the same attorneys acting for the same interests to appoint Messrs. Larue, Trudel and Piche temporary guardians and authorizing them to continue operating in the meantime.

E. M. Mills Is Receiver

E. M. Mills, who has been appointed receiver and general manager of the Whalen Pulp and Paper Company, British Columbia, in succession to G. F. Gyles, is vice-president and general manager of the Washington Pulp and Paper Company, and is largely interested in the Zelerback Paper Company of California. Mr. Mills will reside in British Columbia. The new receiver and general manager was directed by the court to enter into a $40,000 bond. Mr. Douglas, representative of the bond holders, wished a practical pulp man to take charge in the place of Mr. Gyles, who is a chartered accountant. Knox Walkem, for the second debenture holders, consented to the appointment, as did also Joseph Singer, counsel for the Whalem Company at a recent meeting of creditors in Toronto a few days ago. "The situation with regard to the company is very serious," said Mr. Walkem, "and it is only by capable management that the industry will be saved for the province. Mr. Mills is a man of great ability and has organized similar companies. We hope he will get the company on its feet again." There was no opposition to the change on the part of the creditors.

Takes A Different View

Professor Clifton D. Howe, of the faculty of forestry at the University of Toronto, is not altogether in favor of the agitation that is being carried on in Canada against the slaughter of young trees at the Christmas season and characterizes the statement that nearly three million evergreen trees had been taken out of Ontario as nonsensical. "I'd like to see that statement substantiated," he said. "One must not forget that nature puts 2,000 young trees on an acre. When they get ready for pulpwood only about 200 trees are left. The rest have been killed in the struggle for existence. It would, therefore, be a legitimate business to sell the young trees, rather than wait till they have grown to pulpwood size. I am not in favor, though, of artificial Christmas trees. I noticed that some of these trees had been cut out of living trees. If they were logs of pulpwood it would be quite permissible, but if cut from living trees it is a poor business which ought to be stopped. The reason for the statement that Ontario trees were destroyed to supply the American market was not that the Washington Government prohibited the cutting and shipment of trees from the New England States to conserve them, but for an entirely different reason. The embargo was put on owing to the gypsy moth. This pest is all over New England and evergreen trees act as carriers of eggs or cocoons."

Denuding Shock to Swede

Gerhardt Jensen, owner of three pulp mills in Sweden, is deploring the lack of reforesting he observed here during a two months' trip throughout the country studying the pulp and paper situation.

Reforesting of the spruce forests, he said, was woefully neglected, and tracts cut fifty years ago are still bare.

LOCATION OF MILL HELD UP

Hawley Pulp and Paper Company Trying Hard to Reach Decision With Municipality

THE new location of the rebuilt Hawley Pulp and Paper Company, which was recently destroyed by a fire in Oregon City, Oregon, is altogether dependent upon action taken in an ensuing controversy between the City of Oregon City, the Hawley Pulp and Paper Co., and the Oregon City Woolen Mills.

Fire on the night of the eighth of October destroyed the plant of the Hawley Pulp and Paper to such extent as to halt all operation. As the plant was covered by insurance the owners immediately announced that they would erect a new mill with an investment of $1,200,000 in plant and equipment. However, in order to properly erect this new mill so that utmost development would be possible it would be necessary for the city to vacate a small stub end of Third street, which the Hawley people claim is of no particular use to the community.

Armed with a petition signed by 900 out of 1300 property owners in Oregon City the Hawley Pulp and Paper Co. presented its petition to the city council who would have issued the vacating decree desired but for the objection of the Oregon City Woolen Mills, who claim that the street should remain open to permit light and air to enter their plant, as well as their employees to park their cars and go to and from their work in a convenient manner. The controversy has taken proportions of civic magnitude as the woolen mill people are circulating counter petitions. Both the Hawley people and the woolen mill people have proposed to build an electric elevator on the street stub in question, either side proposing that the other party shall bear one-half the expense. The matter, at this writing, is at a complete deadlock. The Hawley Pulp and Paper Company has promised the city council of Oregon City to rebuild within eighteen months if their request is granted.

Expect to Build New Mills

Rumor has it that the Crown-Willamette Paper Co., in Oregon, is to build two small new mills, one a cut up mill and the other a pulp mill, at their holdings at Youngs River Falls, where, it was recently announced by the mills, a power house with turbines and generators will be erected to furnish loading power as well as lighting power for the company's logging holdings in this vicinity.

Under the present system of operation the Crown-Willamette Paper Co. has been throwing all spruce and hemlock logs of less than 12 inches in diameter away as waste, along with slashings, owing to the fact that their donkey engines are too heavy to handle them, that they are difficult to handle when mixed with bigger timber, and that they are troublesome in rafting. Two small mills, such as it is reported in Astoria are to be erected, will, when smaller donkey engines are installed, efficiently handle this smaller stuff now going to waste. The ground up pulp would then be conveyed by barges to the paper mills at West Linn.

The basin above the falls has been cleared away so that a 35 acre lake may be formed by the dam for water and log storing. Immediately below the falls is the stop declared to be selected for the power house.

Astorians attribute the many recent small sales of Clatsop county timber to agents of the Crown-Willamette, and look forward with considerable expectation to further development of their holdings, which furnish a big percentage of payroll income into both the territories of Astoria, where the logging camp is situated and West Linn and Camas where the big paper mills are located.

Continental Paper May Purchase Rumford Mill

Negotiations are under way for the purchase of the mills at Rumford, Me., of the International Paper Company by the Continental Paper & Bag Mills, according to information among the trade in Maine.

According to information obtainable, directors of the Continental Paper & Bag Company, have issued a circular letter to stockholders relative to the proposed purchase and to the method of financing the deal. The company has purchased approximately 60 per cent of the output of the Rumford mill of the International Company during the past few years.

Superintendents P. E. McCarthy of the International and Theodore Hawley of the Continental Mills at Rumford both declined to make any statement for publication at this time.

The International Mills at Rumford have been making bag and wrapping manilas.

NEW USE FOR PAPER

M. Dalery Claims It Can Be Made on a Commercial Scale

A NEW use of paper on a commercial scale is propsed by a French inventor, M. Dalery. This is the manufacture of paper piping.

The paper of light pasteboard is wound directly upon the shaft of a machine, using a tank containing an adhesive substance. The last layers are impregnated with tar, then the pipe is given a covering of bitumen as for gas and water pipes.

More minute details contained in an article published recently in the *Scientific American* are in part: "Suitable measures are taken to produce a large diameter portion at the end of each pipe section, into which is fitted the smaller end of the succeeding section, then the joint is made tight by a tar treatment and by winding the joint with a strip of 3 inch tarred fabric.

"Tests were made with the new piping in order to set forth the three principal characteristics which are required, tightness, strength and interior pressure and good preservation. As concerns the tightness of the piping, several sections were mounted in a vertical position and the bottom was well stopped up, a water pipe being placed in the pipe and allowed to stand for 21 days. At the end of this time there was no trace of leakage, so that this test appears conclusive.

"On the whole, it appears very probable that piping made of paper can be manufactured as a practical article, at least for numerous purposes."

NEW INDIA MILL TO MAKE PAPER FROM GRASS

New Material Has Already Been Successful in United Provinces and Bengal

IT is rumored that the Punjab Paper Mills Company has been promoted with a capital of Rs. 50 lakhs for the manufacture of paper from Bhabbar grass. This raw material has already been successfully used in the United Provinces and Bengal. The new mill will be situated near the headworks of the Western Jumna Canal, where the raw material is accessible, and according to the *Paper-Maker and British Trade Journal* the surrounding districts have sufficient raw material to produce five to six thousand pounds of paper. The monopoly of the produce has been secured for a long period and the cost of the grass at the mills will be Rs. 14 per ton. The labor supply in the district is plentiful, the mill will be worked by electric power generated from a waterfall of 40 feet and it is proposed to manufacture fine quality paper.

The enterprise is viewed as having every chance of success because Lahore is only two hundred miles from the mill, and Delhi, eighty miles, both of which are centers of the paper trade. The consumption in the Punjab is about twelve thousand tons. The transport facilities are good as the Western Jumna Canal is navigable as far as Delhi, and the nearest railway station, twenty-three miles distant, can also be reached by canal. Prices of paper in the Punjab district are always high, owing to the great distance from the United Provinces and Bengal. The present price of imported paper is 5½ annas per pound. The directors consider that a 40 per cent dividend can be earned by selling paper at 3½ annas per pound.

New Booklet on Francke Couplings

Smith & Serrell, the general agents, have issued Bulletin No. 37 of Francke couplings. Particular attention is called to the new high speed type Francke flexible coupling for geared turbine and for high speed motor drives, also the new pressed steel type for little auxiliary drives. The booklet also contains valuable advice about lubrication and the installation and operation of direct-connected machines.

Advocates Tariff Raise

In an address at the annual meeting of the Ontario members of the Canadian Manufacturers' Association, Howard Smith, the president, advocated a raise in the Canadian protective tariff, claiming the manufacturers are unable to compete because of the large imports from Great Britain and the low cost of oversea labor.

The Editorial Page

OPTIMISM FOR THE YEAR

"THE paper industry, with a high record of production during 1923, and with every prospect of good general business in the early months of 1924, is justified in looking forward with optimism to the coming year."

With this statement the keynote of a prediction which augers well for the paper industry as a whole. Dr. Hugh P. Baker, in his article to the readers of PAPER this week, calls on the industry as a whole to buck up, smile, look with confidence on the coming months and go to work.

The statement comes after mature reflection on the successes and the failures of 1923 and is not a wild guess, or an ephemeral dream.

Each department of the industry should lay the groundwork now for a steadily increasing business. Business everywhere is picking up. The facts of the last year say the coming year will show a steady improvement. The failures of the dark days are being liquidated. The demand for all varieties of paper and paper products is increasing. And this inevitably means better prices. No boom year like that mad year after the war can be looked for, but a safe and sane optimism is fully justified.

It is PAPER'S belief as it is that of Dr. Baker, that the tide will turn this year. It is wise to be on the crest.

THE CONVENTION

WITH the opening of the new year, thoughts of the annual convention always recur. April is only a few months away and time seldom changes its habit of flying.

Every appearance at this time is that the Paper Industries Exposition at the Grand Central Palace will surpass the initial effort last year by several leagues. More advance preparations are being made. The lessons of experience are being profited by. A success last year, the event should this year prove the epitome of the paper industry. It should be a real reflection of the entire trade.

The convention of the American Pulp and Paper Association, as well as all its supplementary associations, should have every member and every person connected in any executive or official capacity with a paper or pulp mill present at every session. The benefits are so large and the cost of being present so small that the props are obviously knocked out from under any faint objection to coming before they appear.

And so we say, now is the time to set aside the second week in April, so no important engagements will interfere to keep you away.

From now on: DON'T FORGET THE CONVENTION.

RALLYING TO THE CALL

THERE is cause for immense gratification at the manner in which the many friends of Judge Charles F. Moore responded to the call for aid, shortly after the call went forth. Stricken by paralysis, this inimitable philosopher and friend to man, lies in his bed on Long Island. The response to the call for the sale of his book which will be ready shortly has been generous. Nevertheless, the call is still sounding. The price of the book is $10. Orders for books and remittances should be mailed to N. R. Hopkins, treas- "Judge Moore's Book" Committee, 200 Fifth Avenue, New York.

LET'S LIVEN UP THINGS

TO inject a little life and spirit in its pages, PAPER will give $5.00 each week for the best joke on a man in the paper industry.

This will be a contest with no conditions whatever. The only requirement is that there must be no unkind cut that will injure personally or in a business way.

Tell the paper industry about that good one you have in mind and get $5.00 in good hard cash for it. Help PAPER put a little ray of sunshine into the industry.

Construction News

Wells River, Vt.—The Adams Paper Co., has work under way on a one-story addition, totaling about 10,000 sq. ft. of floor space, estimated to cost $75,000, including improvements in the present mill. The contract is being carried out on a day basis by James Lowe, Woodsville, N. H. Herbert Crabtree is general manager.

Los Angeles, Cal.—The National Paper Products Co., 1789 Montgomery Street, San Francisco, Cal., affiliated with the Zellerbach Paper Co., 534 Battery Street, same city, is perfecting plans for the construction of its proposed plant on 25-acre tract of land purchased at Cudahy, near Los Angeles, to consist of a number of units, with power house, machine shop and auxiliary structures, estimated to cost in excess of $1,500,000, with equipment.

Vancouver, Wash.—The Columbia Paper Mills, Inc., has broken ground for the erection of its proposed local plant, for which a contract was recently awarded to the Austin Co., Cleveland, Ohio. Initial work will be concentrated on the main mill unit. The plant will cost in excess of $200,000.

New Orleans, La.—The proposed local paper mill to be erected by the Great Southern Lumber Co., Bogalusa, La., will be carried out and operated by the Bogalusa Paper Co., an affiliated organization. The initial plant will be equipped for the manufacture of chip board and other paperboard products, used in box production. Later, an additional unit will be established for the manufacture of corrugated containers and cases. The plant will cost approximately $1,000,000, with machinery, and is expected to be ready for operation early in the summer.

Chicago, Ill.—The National Paper Mills, 124 West Twenty-fourth Street, have leased space in the building at 1416-18 North Sangamon Street, totaling about 10,500 sq. ft., for a new works for the manufacture of paper boxes and containers. Harry Armstrong is head.

Stamford, Conn.—The Pine Waste Products Co., is reported to have leased a tract of land in Georgia, exact location temporarily withheld, as a site for the construction of a new pulp and paper mill, estimated to cost in excess of $100,000.

Chicago, Ill.—Bradner, Smith & Co., Van Buren and Desplaines Streets, have work nearing completion on a new seven-story addition, 100 x 150 ft., and will occupy the structure for general expansion at once.

Los Angeles, Cal.—The Pioneer Paper Co., 247 South Los Angeles Street, has acquired a tract of 2½ acres of land adjoining its present plant at Alameda and Fifty-fifth Street, and plans to use a portion of the site for the early erection of an addition, estimated to cost $50,000.

Terre Haute, Ind.—The Terre Haute Paper Co., has purchased the former local plant of the Commercial Distillery Co., including about 35 acres of land, for a consideration stated at $35,000. The company is now operating two mills in this section, and will use the property purchased for early extension of these plants. W. G. Clark is general manager.

Muncie, Ind.—Fire, Dec. 17, destroyed a portion of the local plant of the Hinde-Dauch Paper Co., with headquarters at Sandusky, Ohio, with loss estimated at approximately $55,000, including buildings, equipment, etc.

Mechanic Falls, Me.—Fire, Dec. 17, destroyed a portion of the local mill of the Poland Paper Co. The amount of estimated loss has not been announced. It is purposed to rebuild at an early date.

Kalamazoo, Mich.—The Sutherland Paper Co., has construction in progress on its proposed new mill addition, for carton service, and will push to completion. It is expected to have ready for the machinery installation at an early date.

Marion, Ind.—The Lindley Box & Paper Co., is planning for the rebuilding of the portion of its local plant, destroyed by fire, Dec. 17, with loss estimated at $125,000, including equipment. The re-construction is estimated to cost a like amount; additional machinery will be installed. L. R. Lindley is president.

New York, N. Y.—The International Paper Co., 100 East Forty-second Street, has work under way on two new hydro-electric generating plants, totaling about 20,000 hp., to be used for service at its mills, as well as for industrial power distribution in these districts.

Montreal, Que.—Frank Clarke, representing English interests, has acquired from the Provincial Government a tract of Crown lands in the province, consisting of 2500 sq. miles of timber lands in the valley of the Manicouagan River, not far from Bangor, Me. The sale includes an agreement with the Government to construct and operate a large pulp and paper mill on suitable site, with deposit of $50,000 to guarantee the fulfillment of this and other conditions. It is said that plans will be drawn for the mill at an early date.

Dallas, Tex.—Fire, Dec. 15, destroyed a portion of the works of the E. C. Palmer Paper Co., 407-9 Lacy Street, near Wood Street, with loss estimated at $150-000. It is proposed either to rebuild the structure, or establish the business in another location. Temporary headquarters have been established at the office of the Dorsey Co., 1000-02 Commerce Street. W. M. Corley is manager.

New Companies

Long Beach, Cal.—The Western Paper & Envelope Co., has been incorporated with a capital of $150,000, to manufacture paper specialties. The incorporators are Bert P. Boles, Walter P. Warmbold and Leigh A. Hume. The company is represented by Frank H. Jacques, 516 First National Bank Building, Long Beach.

Greenville, Tex.—The Greenville Paper Co., has been organized to manufacture and deal in paper products. The company is headed by W. H. Camp and T. D. Starnes, both of Greenville.

New York, N. Y.—The Glide Feinberg Fiber & Box Corporation has been incorporated with a capital of $50,000, to manufacture fiber boxes and containers. The incorporators are P. Feinberg and S. D. Glide. The company is represented by Kleiner & Britwitz, 299 Broadway, New York.

Chicago, Ill.—The Lenox Paper Box Co., 426 South Clinton Street, has been incorporated with a capital of $15-000, to manufacture paper boxes and containers. The incorporators are George Stein and Alexander Felman.

New York, N. Y.—F. D. Croce & Co., Inc., has been incorporated with a capital of $100,000, to manufacture and deal in paper products. The incorporators are F. D. and R. D. Croce, and M. Molinelli. The company is represented by Barbieri & Zerilli, 233 West Forty-second Street, New York.

Financial

Newark, N. J.—The Newark Paraffine & Parchment Paper Co., 42 Jelliff Avenue, has arranged for an increase in capital from $500,000 to $600,000 for general expansion.

Muskegon, Mich.—The Central Paper Co., is disposing of a bond issue of $600,000, the proceeds to be used for general financing, expansion, etc.

Pawtucket, R. I.—The American Coated Paper Co., has filed notice of increase in capital from $50,000 to $160-000, for general expansion.

Holyoke, Mass.—George Webster has been appointed receiver for the Whitmore Mfg. Co., manufacturer of papeterie, on petition of the Fitchburg Paper Co., Fitchburg, Mass.

Mineola, L. I.—The Harper Co., has arranged for an increase in capital from $10,000 to $50,000, and 100 shares of stock, no par value, for general expansion.

Plant Operations

The Federal Container Co., Philadelphia, Pa., specializing in the manufacture of corrugated fiber boxes, etc., is running full at its plant, giving employment to a regular working force. The company is closing the largest year of business in the history of the organization.

The Agasote Millboard Co., Trenton, N. J., has distributed a Christmas bonus to employes, totaling $10,000. The amount received by each worker was graded according to length of employment with the company, 16 operatives enjoying the maximum amount, having been with the organization since its establishment about 13 years ago. Approximately 150 persons shared in the distribution.

Business Opportunities

The Bureau of Foreign and Domestic Commerce, Washington, D. C., has information regarding a company at Cork, Ireland, in the market for kraft paper of good quality, Reference No. 8556. Also, of a concern at Nantes, France, desiring to purchase wood-fiber board of all kinds, Reference No. 8524.

The Domestic and Foreign Commerce Department, Chicago Association of Commerce, 10 South La Salle Street, Chicago, Ill., has received an inquiry from a company at Yokohoma, Japan, in the market for printing machinery, types, etc., No. 2572. Full information on request.

NEW BRAND NAMES

Applications for registration of the following brand names have been made in the Toilet Paper Label registration Bureau of the Tissue Paper Manufacturers Association:

From November 20, 1923, to and including December 20, 1923:

Evenglo, Farabuv, Lady Luck, No. 26, Mumark, Nu-Star, Our Seal, Pride of the Woods, Pull One, Selfelp, Sunglo, Vapordu, Wiplot, all for the Fort Howard Paper Co., Green Bay, Wis.

The following brand names have been registered in the Toilet Paper Label Registration Burean of the Tissue Paper Manufacturers Association, from November 20, 1923, to & inc. December 20, 1923: Humbolt—National Paper Products Co., San Francisco, Cal.; No Rivl—Fort Howard Paper Co., Green Bay, Wis.; Nunxl—Fort Howard Paper Co., Green Bay, Wis.; Rosedale—Oswego River Paper Mills, Phoenix, N. Y.

The following appeared in recent issues of the official gazette of the United States Patent Office:

Trade-Marks Published for Opposition, O. G. of November 13, 1923, Serial No. 184,359; Quality Crepe—(Oblong containing an oval picture frame with the words, "Quality Crepe" and "For the toilet," with a background of vertical black and white stripes with an ornamental flower pot at each lower corner.) Northern Paper Mills, Green Bay, Wis. Published for opposition November 13, 1923. Claims use since July 11, 1922.

O. G. of November 13, 1923, Serial No. 184,576; (A band of black and white checks with an ornamental oval in the center and a smaller oblong to the right.) Albany Perforated Wrapping Paper Company, Albany, N. Y. Published for opposition November 13, 1923. Claims use since July 23, 1923.

O. G. of November 20, 1923, Serial No. 184,356, Northern Bear (Polar scene with the sun on the horizon and a bear in the foreground, the words "Northern Bear" through the center.) Northern Paper Mills, Green Bay, Wis. Published for opposition November 20, 1923. Claims use since March 30, 1922.

Trade-Mark Registrations Granted, O. G. of November 6, 1923, Registrations No. 175,284, Serial No. 182,529, The Unique: (Oblong design containing an oval in which are the words, "The Unique," and along the lower part is a floral design). Albany Perforated Wrapping Paper Co., Albany, N. Y. Published for opposition August 21, 1923. Claims use since June 1894. Registration granted November 6, 1923.

O. G. of November 6, 1923, Registrations No. 175,286, Serial No. 182,049, Gosling: Fort Howard Paper Company, Green Bay, Wis. Published for opposition August 21, 1923. Claims use since May 23, 1923. Registration granted November 6, 1923.

O. G. of November 6, 1923, Registrations No. 175,326, Serial No. 180,758, Water Flower Crepe: Fort Howard Paper Company, Green Bay, Wis. Published for opposition August 14, 1923. Claims use since July 12, 1921. Registration granted November 6, 1923.

O. G. of November 6, 1923, Registration No. 175,358, Serial No. 178,043, (Design consisting of an oval partly surrounded by small squares and divided into two sections. In the upper section are the words, "Interlake Tissue Mills Co., Limited, Merritton, Canada." In the lower section is a drawing of Lakes Ontario and Erie, showing Niagara Falls and Merritton with an arrow from the upper section pointing to Merritton.) Interlake Tissue Mills Co., Ltd., Merritton, Ontario, Canada. Published for opposition August 14, 1923. Claims use since 1914. Registration granted November 6, 1923.

O. G. of November 27, 1923, Registration No. 176, 730, Serial No. 173, 508, (Design consisting of an oblong with the upper line extended and pointed in the middle and at the ends, and with the lower line rounded at the corners and pointed in the middle.) Levey Printing Company, Indianapolis, Ind. Published for opposition September 11, 1923. Claims use since January 1915. Registration granted November 27, 1923.

While on a recent tour of the Northwest, George Hearst, of San Francisco, son of William Randolph Hearst, visited the plants of the Crown Willamette Paper Co. at Camas and West Linn, the Washington Pulp and Paper Company at Port Angeles, the Powel River Paper Co. at Powel River, B. C., and the Crown-Willamette Plant at Ocean Falls, B. C.

TEMPORARY RECEIVER APPOINTED

Mountain Mill Paper Company Will Have S. T. Stevenson at Its Head

LOUIS T. STEVENSON, of Pittsfield, Mass., has been appointed temporary receiver of the Mountain Mill Paper Company, of East Lee, Mass., by Judge William A. Burns of the Superior Court, and the question of making the temporary receivership permanent will come before the court for a hearing on January 5.

The receivership is a friendly one, according to officials of the company, and is made on agreement between the company and some of the larger creditors in an effort to conserve the company's assets.

The company some time ago made enlargements of its plant and purchased additional machinery, which depleted its working capital and affected its financial condition. The receivership is concurred in by the Lee National Bank, the Lee Electric Company and the Clark-Aiken Company of Lee, Mass. In its petition, the company states it is indebted to the Lee National Bank on notes for $12,500, on which $5,000 in now overdue; that it is indebted by Louis T. Stevenson on serial negotiable notes about $200,000, of which $2,500 is overdue; that it is indebted to creditors on open accounts some $49,500, much of which is overdue and that trade acceptances amount to $41,051, of which some is overdue. It owes the town of Lee some $9,565.17 for back taxes. In all there are about 140 creditors.

Of the company's cash on hand, $1,500, all is due employees for wages. It has accounts receivable totalling $8,000. Its fixed assets of machinery and real estate total $300,000 subject to a $40,000 mortgage. It has finished stock on hand valued at $6,000, stock partially prepared valued at $8,000 and raw material valued at $6,000. The petition sets forth that if its creditors pressed and a forced sale was held, it would result in such a loss to the company that insolvency would follow. It is generally believed that if time is afforded the company through a receivership, will be able to meet its obligations and continue its business.

Questionnaire Results on Bonus and Taxes

As the result of the referendum taken by the paper industry on the questions of the bonus and the Mellon plan for the reduction of taxes, the following letter has been sent by Dr. Hugh P. Baker, Executive Secretary of the American Paper and Pulp Association, to Senators and Congressmen from the paper making states:

"During the past month a questionnaire was sent to over 400 pulp and paper mills in the United States, from Maine to California. This questionnaire asked the attitude of pulp and paper manufacturers as to the proposed soldiers' bonus and as to Secretary Mellon's tax reduction proposals.

"A large proportion of questionnaires have been returned to the Association and over 99% of the pulp and paper mills reporting are opposed absolutely to a bonus for able-bodied veterans, though they are strongly in favor of the government doing everything within reason for sick and wounded veterans.

"Over 95% of the pulp and paper mills reporting are strongly in favor of proposals for tax reduction as made by Secretary Mellon.

"As a national association, representing paper manufacturers from Maine to California, we urge your opposition to the bonus and your support of reasonable tax reductions. We speak in this matter for the entire pulp and paper industry of the United States."

Foreman's Safety Smoker

On Thursday evening at the Port Edwards Hotel at Port Edwards, Wisconsin, the Employes' Mutual Liability Company of Wausau, Wisconsin, held a safety smoker. There were present some fifty foremen of the Neboosa Edwards Paper Company, and they were full of song and pep for Safety. The meeting was under the personal supervision of Fred Braun and Al Kroes.

Mr. Kroes, well known to Neboosa-Edwards Mill employees, gave one of his inspiring talks to the men on the subject of "The Foreman and His Relation to Safety."

Mr. Braun told why the six cylinder Safety Campaign was organized and gave some interesting and vivid descriptions which left a deep impression on all those present.

The records of Accidents in the Nepco Mills for 1923, so far, is less than 100 and every effort will be made to cut this record 25% in 1924.

FINDS POOR COLOR MATCH IN WHITE PAPERS

PAPER that is supposed to be white is rarely altogether so. In order to be truly white the paper would have to reflect equal portions of all colors when viewed by daylight, but in nearly all cases there is some one or more colors which are not reflected as well as the others are. Measurements of such tints were made at the Bureau of Standards, Department of Commerce, the method used consisting in the determination of the relative amounts of blue, green, and red light reflected from 21 samples of commercial papers when viewed by daylight. These samples were collected from various sources and included newsprint, printing, book, writing, bond, and ledger papers.

Out of the twenty-one, only two were found to be nearly white, the others being quite deficient in blue and less so in green. In order to overcome this difficulty it is often customary in paper mills to add a blue dye to the finish in the beater.

The attempt was also made to match the samples for color with the unaided eye, observations being made by seventeen individuals experienced in color work. There was practically no agreement among the seventeen as to the whiteness of the papers, which would seem to be an effective argument for the employment of some method more accurate than the unaided eye in the color grading of white papers.

These tests are described and the results given in Technologic Paper No. 244 of the Bureau of Standards entitled "A Measure of the Color Characteristics of White Paper." Copies may be obtained from the Superintendent of Documents, Government Printing Office, Washington, D. C. The price is five cents.

Fresh or Dried Papyrus?

When Messrs. Vidal and Aribert made experiments on papyrus from the Gaboon at the Ecole Francaise de Papeterie, it was suggested that freshly cut papyrus would possibly be more easily converted into paper-pulp than the dried material.

The same investigators have now experimented with fresh papyrus grown at the Institut National d'Agronomie Coloniale at Nogent-sur-Marne and it was found that treatment was not facilitated by using fresh material. In the case of both the fresh and dried material it was necessary to use 13 per cent of caustic soda to obtain a pulp which could be bleached. The yield of unbleached pulp varied from 32 to 35 per cent and that of the bleached pulp from 25 to 27 per cent, these figures being about 6 to 7 per cent lower than those obtained with the dry papyrus from the Gaboon. Some are of the opinion that the low yield was due to the papyrus being somewhat immature from having been grown in too cold a climate.

Proud of Colorado's Forests

H. N. Wheeler, chief of the office of public relations in the Denver branch of the United States forest service, was a recent visitor to New York and Washington, and so proud he is of the fire prevention methods used in Colorado's forests—and, of course, the beauty of the timberlands—that he staged a demonstration of the ways and means for timber protection against fire. To the school children of the Capitol city he spoke of the beauty of the forests and the need for fire prevention and how to prevent fires.

Paper Men Bringing Suit Against Drug Co.

Carter, Rice and Carpenter Paper Company; Peerless Printing and Stationery Company, and the Inland Paper Box Company, of Denver, Colorado, have filed an involuntary petition in bankruptcy against the Scholtz-Mutual Drug Company, a local concern, in the Federal District Court here. The claims of the three petitioners will amount to about $600 and it is charged by the petitioners that the drug company committed an act of bankruptcy last September by making an assignment to a general committee of creditors, and it is alleged this assignment was not recorded or registered.

The company was incorporated under the laws of Delaware in 1920, taking over the Scholtz Drug Company. Its annual report filed last March showed assets of $2,609,826 and debts of only $686,508.

Waste in Pulp and Paper Industry

By B. T. McBain, *Assistant General Manager, Nekoosa-Edwards Paper Co.*

The Matter of Weight

MOST paper is sold by the pound, 100 pounds or by the ton. In any event, by weight, some paper is sold by ordered weight in some districts, such as sheet news, and in others Groundwood Tag comes under this plan. In some places wrapping paper is guaranteed as to yardage and strength and if on measuring a roll the production is not there, that should be, credit is often rendered, after considerable squabble. Other grades are sold by the ream, and so it goes.

Then the converter who buys his paper by one method sells it by another. For instance, paper for typewriter use, originally sold by the pound, is sold by the ream to the final consumer.

Paper for adding machines, purchased by the pound in jumbo rolls, after being rewound and refinished, is sold at so much per roll and each roll is guaranteed to contain a certain length of paper. So it is with tire tape and gummed tape, as well as for other like grades.

These inequalities or abuses have crept in on account of competition and the desire of one manufacturer to cut in or undersell another, with the result now that these abuses work right back onto the paper manufacturer either in orders for lighter paper which must be as strong as the paper originally ordered heavier, or in other ways the difference must be met.

Standards should be made and set for everything, in every line of endeavor and while Mr. Hoover's Department of the Government is endeavoring to put over something of this sort and will no doubt do a fine stroke of business for the industry and business generally, as well as the consumer, it is too bad that he cannot be allowed to go even farther and in the name of justice to producer and consumer alike, formulate and enforce standards wherein all abuses of the trade are wiped out.

All things of this kind are waste. Waste must be paid for by someone and if the consumer does not through increased price, the producer must through increased cost and smaller or no profit.

Waste everywhere.

Printing House Craftsmen Endorse Conservation

At a meeting of the Milwaukee Club of Printing House Craftsmen held in December this resolution was unanimously adopted:

Resolved, that we urge our membership internationally to use every means available to spread the gospel of forest protection, and urge each one of our clubs to take favorable action to effectually stamp out sporadic destructiveness.

E. George Myers, president of the Milwaukee Club of Craftsmen, expresses the hope that other organizations will see the wisdom of adopting measures such as the Wisconsin Forest Protective Association, because they are surely vitally important to continued economic paper production.

Donald F. McQuesten, formerly manager of the Philadelphia office of the Nashua Gummed and Coated Paper Company, has resigned to become associated with the A. L. Cole Co. of Lawrence, Mass., stationers.

"EASTCO"
BLEACHED SULPHITE

Using "Eastco" Bleached Sulphite ourselves, testing it day by day, in producing our line of "Eastco" Fine Writing Papers, we have complete control—because we have complete knowledge—of its quality, uniformity and adaptability to the requirements of the paper maker.

"Eastco" Bleached Sulphite is good pulp; it makes good paper. Furnished in Bales, Rolls or Laps as required. Write for Samples and Prices.

Paper and Board

New York, December 31.—The final week of the year is proverbially a quiet period in the paper industry, and the past week has been truly characteristic of the holiday and inventory season. Manufacturers have been more engrossed with taking stock, effecting machinery repairs and in attending to other matters in connection with the closing up of their business for the year than in securing new business; jobbers have been in about the same position, and so have paper consumers, so that other than routine trade nothing of moment has developed in the markets.

It can be said, however, that the paper market is finishing the year in a very firm way; that is, prices of most kinds of paper display better than usual steadiness for just this period, and no further recession of consequence has occurred in quoted prices. The tendency in a majority of descriptions of paper is upward, and sentiment in the trade is unmistakably of optimistic character. Nearly every one making and selling paper is looking for good business in 1924, business of very healthy variety and of fairly heavy volume, and the opinion is common that prices of paper have about seen their bottom levels for sometime to come.

With newsprint in a very strong market position, and being consumed at a rate never before witnessed in the history of the industry, it is felt that the market as a whole will rule steady to firm during the next few months and that demand for other kinds of paper will develop in satisfactory tonnage and keep values on at least prevailing levels if not lead to advancement. Certainly business in other lines is in a healthy condition, is of fairly broad scope, and promising to expand after the new year gets under way, and it naturally follows that if general business is active demand for paper of all kinds will be good since the call for paper depends on practically all other industries.

At the moment the bulk of trade activity is against contracts and back orders. Paper mills in various parts of the country have greatly curtailed in the past few days to permit necessary repairs to mill equipment and to compile year-end inventories. There has not been much new buying. Jobbers have filled the orders coming in to them mostly from stock in an effort to keep their own stocks as low as possible, and consuming demand has subsided to a pronounced degree as it invariably does in the holiday period. The movement of supplies from mills into consuming channels on contracts has continued in steady volume, however, and a most encouraging feature is that publishers and other large users of paper who purchase on contract have lately arranged contracts involving appreciably increased supplies for the new year, indicating that they expect to consume larger amounts of paper in 1924 than in the year drawing to a close.

Consumption of newsprint has been heavy during the holiday season. Newspapers in New York and in all of the large cities of the country, and the small ones as well, have printed big issues, and circulation has been better than normal, according to the unofficial figures available. Recently compiled statistics show that Canadian production of newsprint during the first eleven months of 1923 totaled 1,166,225 tons, compared with 993,988 tons produced in the same period of 1922, showing an increase amounting to 17 per cent. The estimated production for the year is 1,270,000 tons, or 189,000 tons over that for 1922. United States output has been relatively as large in 1923, and this year is likely to go down in the annals of the industry as the greatest twelvemonth of newsprint consumption, and yet there is every prospect that the record will again be exceeded in 1924.

Shading of quoted prices is still the feature in wrapping papers though most manufacturers are maintaining the prices named to the trade. Coarse paper mills want orders and are not hesitating to grant prices concessions to land business. Fine papers are holding fairly in price, and rising prices of raw materials—rags in particular—seem likely to send quotations on bonds and ledgers higher. Book paper is quotably unchanged. Some manufacturers are shading prices when to do so means securing orders, yet machine finished book paper continues to bring around an average of 6.50 cents a pound f. o. b. New York.

Box boards are holding steady in price and probably are marked by a firmer undertone than are most kinds of paper.

Mechanical Pulp

Mechanical wood pulp is in a more or less stationary market position, both as regards prices and demand. Quotations have settled at about a basis of $40 per ton f. o. b. grinding mills for domestic ground wood for prompt shipment, and consumers seem satisfied to meet this figure for such supplies as they require. Moreover, demand is developing in a consistent way; not in any great volume but in ample tonnage to sustain values, particularly since a majority of producers have no sizable stock on hand. Some offering of imported ground wood of Scandinavian origin at around $38 a ton ex dock New York and other American Atlantic ports is reported, and consumers in certain cases are filling the bulk of their current needs with pulp from this source. As the winter progresses prices of ground wood are likely to stiffen if the market follows its usual trend.

Foreign and Domestic Chemical Pulp

Not much activity of an important scope is reported in chemical wood pulp. Occasional sales are of course going through but paper manufacturers have let down in their buying momentarily, and the market rules rather quiet. At the same time prices exhibit a steadier undertone than has been noted in some months. The reason for this in the face of slow demand is apparently that market levels are down to a point where sellers do not expect any further decline and therefore are not pressing pulp onto the market. Prices at which some sales of foreign pulp on the spot in this country have recently been sold are below the cost of replacement by a good margin, it is said, and importers contend that this situation cannot long endure. Scandinavian kraft has sold down to 2.50 cents a pound ex dock New York, and No. 1 foreign unbleached sulphite at 2.60 cents, while foreign bleached sulphite of secondary quality has changed hands at 3.50 cents ex dock New York. Indications are that little or no additional pulp is available at these prices, importers generally asking higher rates. Quotations ex dock New York and f. o. b. pulp mills are:

Domestic Rags

Papermaking rags are quotably firm and the price tendency in nearly all grades is in an upward direction notwithstanding that mills are at present buying in a careful manner and chiefly to cover direct requirements. Roofing rags have advanced to where sales of No. 1 packing have been made at $1.90 a pound f. o. b. New York, and of No. 2 grade at $1.60 New York. New cuttings are stiffening in price, partly because they are being consumed in larger than normal amounts as a cotton substitute, owing to the high price of raw cotton. Dealers quote $13.50 a pound f. o. b. New York for No. 1 white shirt cutting, $8.25 for light silesias, $11.75 for unbleached muslins, $8.75 for blue overall cuttings, and $5.50 for

Imported Rags

Strength in the lower grades features the foreign rag market. Sales of dark colored cottons to roofing paper mills at $1.65 a pound ex dock New York have been reported, and this is said to be the lowest price which importers will now entertain on these rags. Linens are quotably firm, and blue cottons are stiffening in price. Ex dock New York quotations are:

Bagging, Rope, Etc.

A firming tone in old bagging prices and steadiness in old rope is noted. Domestic manila rope has settled at around a quotable level of $6.50 per pound f. o. b. New York, and dealers are said to be averse to accepting orders at less, while foreign rope is reported fetching $6 to $6.25 ex dock New York for No. 1 manila. No. 1 scrap bagging of special quality has sold up to $1.50 a pound f. o. b. New York, according to reports, though $1.25 is a more representative market basis. Roofing bagging is firm at 90 cents to $1 a hundred pounds New York. F. o. b. New York prices follow:

Gunny, No. 1	1.25	@	1.40

Mixed Strings	1.00	@	1.25

Old Paper

The current movement of old paper into mill channels is of limited compass. Consumers are buying only when pressed by necessity, and in most cases they are managing to secure the supplies wanted at price concessions. At the same time there has been no concerted decline in values. Quoted prices are fairly well maintained, particularly on the higher qualities, and sellers seem imbued with expectations of better prices in the near future. Folded newspapers are selling at 80 cents a hundred pounds f. o. b. New York, and No. 1 mixed papers at 60 cents. Flat magazines bring about $1.50 per pound, or a little higher, at dealers' shipping points, while shavings are quoted at $3.75 to $4.00 a pound for No. 1 hard white and $3.00 to $3.25 for No. 1 soft white shavings f. o. b. New York. Old kraft paper is steady at $2.00 to $2.15 a pound, and white blank news is firmly quoted at $2.25 to $2.35. F. o. b. New York prices are as follows:

No. 1 Hard White Shavings	3.75	@	4.00
No. 2 Hard White Shavings	3.25	@	3.50

Quebec Sells Largest Woodlot

Novel provisions surrounded the offer of 2,500 square miles of timber offered recently by the province of Quebec. The acreage was the most extensive ever offered for sale as a single lot in the province, and the buyers will be given five years to complete eight mills in certain specified cities of the province. Each mill must have an initial daily capacity of at least 100 tons of paper, and a capacity for producing pulp 100 tons in excess of that required for paper. At the end of seven years the paper production must be increased to 200 tons per day.

FACTORY ELECTRICALLY HEATED

By P. H. FALTER

Vice-President Electric Furnace Co., Philadelphia, Pa.

THE factory of the Ford Motor Company at Green Island, N. Y., is heated by hot water which is heated by electricity. It is an idea to make paper makers think. The building is 1140 ft. long, 120 ft. wide, and consists of three bays, the two side bays being about 20 ft. in height and the central bay about 35 ft. in height. The outer exposure of this building consists of about 60 per cent of glass. 65,000 square feet of radiation is installed. Water is circulated by motor-driven Centrifugal pumps at the rate of 1500 gallons per minute, and at a pressure of about 40 lbs. The water is circulated through one or two electric heaters, depending upon weather conditions and is raised in temperature from 135 deg. F. to about 153 deg. F. The heaters are of the electrode or water resistance type, having a capacity of 3200 KW each, and are operated at 4600 volts, 3 phase, 60 cycles. The electrical input is controlled by the level of the water in the boiler exactly as in the case of a steam generator and independent of the pump pressure. The change of water level is accomplished by an air column in the heaters, the length of which can be varied at will by admitting or releasing air. Air for this purpose is supplied by the compressed air system of the plant.

The control of power input is, therefore, extremely simple and could be accomplished by thermostatic attachment, if desired, but inasmuch as the boilers or heaters operate very steadily and it is only necessary to change the power input according to outdoor temperature, thermostatic control is hardly worth while.

The heaters are specially equipped with baffle plates to prevent the direct passage of cold water through the heaters. Inasmuch as the heaters are installed in the building to be heated they are not even covered and their efficiency is, of course, 100 per cent.

Each heater occupies a floor space only 4 feet square and a surge tank, occupying an equal amount of floor space, is required in order to avoid waste of water when the load on the

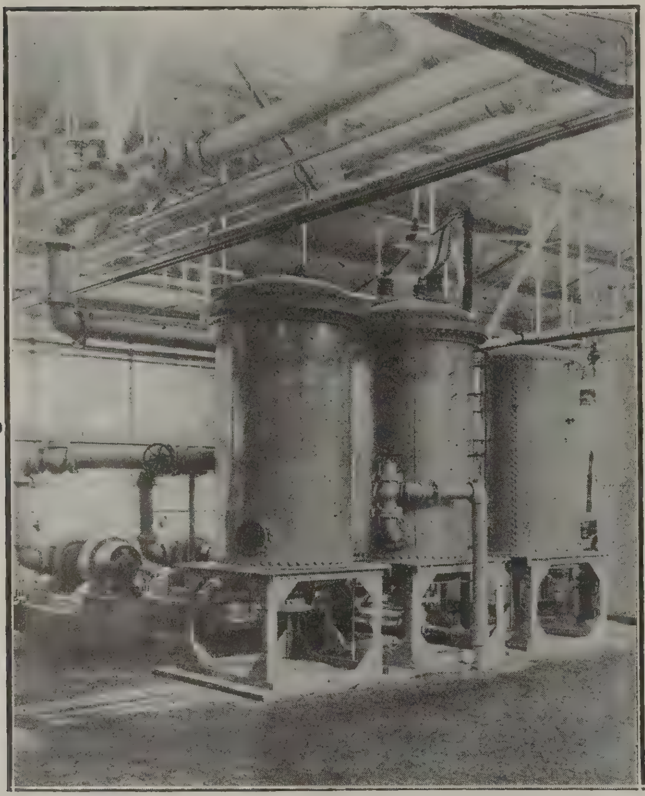
INTERNATIONAL
Wire Works

"The Fourdrinier that took the
Ire out of Wire"

INTERNATIONAL WIRE WORKS
MENASHA, WISCONSIN

heaters is reduced; thus only a small amount of water need be added occasionally to make up for leakages from the system.

The advantages of electric heating are absolute cleanliness, minimum of space required and perfect efficiency. No separate heating plant is required, no fuel storage, ash handling or labor. The heaters only require occasional attention by a janitor or other attendant who also looks after the circulating pumps and other duties. While the opportunities for the application of electric heating to buildings on a large scale may be limited, yet heaters of this same type might well be used for feed water heating, in which case they could be thermostatically controlled to maintain the feed water at any desired temperature.



TYPE OF BOILER USED

View of heating room of Ford Motor Company at Green Island, N. Y. showing how water boilers are heated by electricity

Even if only the surplus power of an electrical system were employed to heat feed water or to produce steam for feed water heater a steam generator would pay very handsome returns on its cost in the value of the coal which it would displace. The load factor on a system could thus be maintained at practically 100 per cent and even the power factor would be favorably effected since the boiler or heater, being a non-inductive load, operates at unity power factor. The cost of the installation is very low as compared with the cost of fuel equipment of equal capacity and the cost of operation often is almost literally nothing when the electric heaters or boilers can be put in charge of a regular boiler-room crew.

Many Greeting Cards Received

PAPER has been the recipient of a host of holiday greeting cards during the past week, wishing the journal well and extending best wishes for the coming year. Among them were greetings from the Peninsular Paper Company, a neat inscription on a thin slice of pulpwood, from James Raymond Simmons; from James Louis Carey, Chicago; Charles F. Hubbs & Company, Butler Paper Corporation, Chicago; the New York State College of Forestry; the Textile Color Card Association of the United States, the Link-Belt Company and others.

ORR FELTS and JACKETS

Lowest Cost per Ton

If you judge felt values, not by what you put into the equipment, but what you get out of it—then you will specify ORR 3 stripe Endless Felts for ORR felts will produce the lowest cost per ton. They "stand up" under severe usage. Orr durability is acknowledged everywhere. Their strength and long life are as dependable as their reliability and quality.

In the 32 grades of Felts and Jackets we can match your most exacting demands. Tell us the kind of paper you desire to make, and we will send you samples of felts that will economically serve you and help you to produce paper at lowest cost per ton.

THE PICKLES DRYING REGULATOR

Reasons why you should have it on your machine are: First, it regulates the drying of paper automatically, irregularities are eliminated; second, higher machine finished papers are attainable, because it is possible to maintain the proper quantity of moisture in sheet, as it passes to calenders; third, mills having tried it on one machine have ordered it for all their machines. Full particulars upon application to

Cleansing of Paper Makers' Felts

This Important Matter of Mill Operation Is Discussed by a Man Who Knows His Subject Thoroughly

Written for PAPER
By C. T. HAMILL

Trained in Chemical Engineering at Brown University and McGill University, Mr. Hamill secured experience in practical paper making with Crocker-McElwain Company. He assisted in organizing the School of Papermaking at Syracuse University and later was identified with the Hollingsworth & Vose Company as Chemical Engineer. After training in design and manufacturing processes at the Albany Felt Company's factory, he entered their sales organization and now represents them in the Central States and Canada.—EDITOR.

THE subject of this article is one which has caused much discussion in paper making circles for many years. It is far too presuming on the part of any individual to assume that his experience in this direction should be considered final and complete. It is hoped that such an article as this may be of service by suggesting various phases of this comprehensive problem in which someone may find an idea or suggestion which, with proper modification, may bring him a solution.

The term "Papermakers' Felts" is generally employed to cover all classes and grades of fabrics used in the manufacturing processes of papers, paper board, fiber board and pulp. Under this term is also included every type of woolen fabric used by affiliated industries whereby a wet leaf or sheet of stock is pressed or transferred in the machine.

Of Great Importance

IT is very evident that the cleansing of such fabrics is of great importance in the successful operation of the machines as well as in the quality of the manufactured product. There are today almost as many methods employed in cleansing felts as there are different kinds of felts manufactured. All of these numerous methods fall evidently under some fairly uniform method of classification. Several different classifications arise, it is true, depending upon the manner in which the subject is viewed. A general classification of felt cleansing methods may be suggested as follows:

I. Cleansing of felts on machines while in actual operation.
II. Cleansing of felts on machines, while not in actual operation.
III. Cleansing of felts after removal from machines, the object of the same to make the felt ready for use either upon another machine, or upon the same machine for the same or another grade of finish.

It is clear that each of the above methods has its advantages as well as its disadvantages. Process III usually gives a cleaner, softer felt, but takes more labor and time. Process I and II can naturally be applied only to certain machines and certain grades of paper product. The latter fact suggests a still further classification of felt cleansing methods, namely one based upon the grade of paper produced, since the latter determines in a large measure the character of the foreign material which adheres to the fabric and which must be removed. The object of cleaning a paper makers' felt, briefly stated, is to revive in a used and dirty felt, the desirable qualities of a new fabric

Making New of the Old

FELTS fill up and require cleansing when used in manufacturing practically all grades of stock. This cleansing, although generally considered so, is not always directly dependent upon the quality of the paper produced. Fine papers fill felts almost as quickly as coarse roofing paper. In each case the felt is filled by radically different but nevertheless objectionable materials. Felts used in straw paper and straw board production seem to present the greatest problem of all. The second classification as noted above, namely one based upon the grades of paper and board produced, might be outlined as follows:

Felts used in the manufacture of

I. Straw paper and straw board, together with other grades of paper in whose manufacture relatively large quantities of lime are used in the cooking process.
II. Bond, Writing and Ledger papers and other corresponding grades.
III. Book and coated papers.
IV. Manila, Jute, Sand paper, and tag stocks in general.
V. Chip and news board, binder's board, counter board and roofing papers.
VI. Newsprint and tissue and pulp in all grades.
VII. Leather board and heel board.

Class I:—Straw paper and straw board present serious problems, for even in the most exacting mills with the finest facilities for washing cooked stock certain quantities of residue are found. Almost without exception the length of felt services on straw paper is in direct proportion to the effectiveness of the washing process. The felts fill up with lime and quantities of the harsh incrusting substances found in straw itself. After a few days of operation the felts must be cleansed often in order to get any tonnage at all over the machine. It may be worth while to point out that some forms of lime are virtually insoluable in water. The lime, therefore, embedded in the felt, is removed largely by mechanical suspension in the wash water rather than by solution. Obviously the complete removal of the lime cannot be accomplished in the period of time usually allowed for felt washing.

When felts fill up with alkaline materials the process of removal must be accomplished either by acids or by a mechanical method such as whipping. Prolonged whipping does but little good, more often tending simply to embed the solid particles of lime still more deeply in the body of the woolen yarns. The latter action is highly undesirable, inasmuch as lime possesses certain caustic qualities and will injure wool in a manner much the same as caustic soda, but to a lesser degree.

The process of treatment with acids is called "souring" and is absolutely necessary to remove alkaline materials from the felt. In order not to lose too much time in production most mills have acid dips so arranged that the entire width of the felt passes under a felt roll and is depressed into a trough of dilute acid, the fabric being washed almost immediately by a water shower located only a few feet away. In some mills this souring process is carried on while the felt is actually on the machine, but in other mills the felt is removed and slacked up to allow this souring treatment.

*Professor Haven in a recent investigation has definitely shown that felt fabric is radically injured by comparatively mild acid solutions, as well as by those of greater strength. This is true of the common vitriol found in every paper mill as well as of the more expensive hydrochloric acid of commerce. When the concentration of the acid solution is over and above a certain critical amount the extent of the injury has been shown to be dependent upon the further concentration of the acid used, the temperature of the acid solution and the length of time the felt is immersed in the acid bath.

Straw board felts, because of their length and the difficulties involved, are not usually removed from the paper machine, but are soured while in place by means of a shower pipe. A dilute solution of vitriol is made up in a barrel, pumped into the shower pipe and sprayed directly on the moving felt. The soured felt is then immediately washed and rinsed, usually by means of another shower pipe located close by. There is no question but that these methods are effective. The problem then becomes merely a question of time and lost production as compared with the injury done to the felt. Every individual mill must decide the question from its own standpoint. Extended periods of felt service, made possible only by often repeated sourings and washings, with their consequent losses in production, may approach the "penny wise and pound foolish" stage.

Class II. Next in order of classification comes Bond, Writing and Ledger papers. Naturally Index and Bristols may be included here. Felts used on Fourdrinier machines making these grades are usually classified as wet press, second press, and in many cases third and fourth press felts. The very nature of the construction of felts for these several uses means a difference in the cleansing methods necessary. In many instances, methods I and III of the first classification are employed on the same machine and even with the same felt. A wet felt is of a lighter and more open construction. The following press felts are more closely fulled in order to provide an improved finish. Regardless of its construction the first felt, because of its position on the paper machine, fills up first, thereby frequently necessitating its removal from the machine for a more careful and complete washing. At the same stage in the operation, however, roping the second, third and fourth press felts is sufficient. To a man in a board or dry felt mill, the term "roping" may not mean very much. This is simply a term applied to the washing and wringing process which is carried out as follows. All pressure on the felt is relieved and the tension slacked back so that the fabric hangs baggy on the felt rolls. The press section is then set in motion and a solution of soap and sometimes soda ash is shot all over the slowing moving felt through a hose. When the felt is thoroughly soaked with the soapy solution the edges of the felt are carried to the middle of the machine and gentle pressure applied by lowering the press roll. This wringing, squeezing, washing operation is continued for five or ten minutes, then a fresh stream of cold water is directed against the roped felt and the washing out of soap and dirty water is begun. When a satisfactory degree of cleansing has been reached, the felt is turned over, provided it is of a construction which makes this possible, and straightened on the machine. The press roll is then lowered and the felt drawn snug ready for use. One, two, three or more felts may be treated in this manner at the same time and operation again resumed. This is, of course, only a temporary solution of the problem for almost always the felts are finally removed and more completely washed in a machine constructed for that particular purpose. Generally the accumulation of foreign material causing trouble here is rosin residue, starch, alum, fiber and lime. A good grade of soap, sometimes small quantities of soda ash, and high grade general washing powders are found to be the most effective agents for the removal of residues of this kind.

Book and Coated Papers

Class III. The felt equipment for book and coated papers which fall under Class III requires most careful attention and continual cleansing. Again the question of the type of foreign substances comes upper most. The very nature of these papers necessitates the use of relatively large quantities of some filler like agalite, clays, asbestine, pearl filler, starch and rosin. For this reason the felts fill up with quantities of resinous materials and soda fiber as well as materials used as filler in the furnish.

Rosin usually in the partially cooked Sodium Resinate form is precipitated by the use of alum, forming sodium alumin resinate, which is insoluble in water. Hence the properties of the soapy sodium resinate compound are lost and an ever troublesome rosin compound is deposited on the fibers in the yarns. All of these materials tend strongly to fill up the felt clothing on the machine. It is, of course, absolutely necessary that these or corresponding materials be used in the actual manufacture of a satisfactory

---

*NOTE: Professor George B. Haven of the Mechanical and Textile Departments of the Massachusetts Institute of Technology recently carried out for the Albany Felt Company a careful investigation of the effects on felt fabrics of various commercial soaps, powders, and acids used in the paper industry for felt cleansing. His report covering this investigation has been published in monograph form and may be secured from the Albany Felt Company on request.—Ed.

sheet of paper for the several uses to which such papers are put, especially printing. To cleanse a felt either wet or press when filled with such material, a large percentage of which is totally insoluble in water at any temperature, presents a serious problem to the paper manufacturer. In a general way, "roping" felts is effective but by far the most efficient method is a thorough cleansing in soap solution. This will do more to revive the qualities of the felt clothing than anything else. This method, to be sure, necessitates removal from the paper machine. It is at this point that the felt washer so common today in all book mills does its most effective work. Caution must, however, be employed in its use, for it must be remembered that wet press and press felt equipment employed in the manufacture of these grades of paper are of very fine construction. Fine grades of wool are used which may be injured much more easily than the coarser grades employed in the manufacture of cylinder wet and cylinder press felts. Too extended a treatment in the soap solution in the felt washer may result in a felt so badly shrunk that it cannot be used again on the same machine, not to mention the undesirable effect on the actual texture of

COMPARATIVE TABLE—FELT CLEANSING METHODS

Class of Product	Grade of Paper	Type of Machine	Class of Felts	Felt Impregnations		Felt Washing Method	Materials used in washing
				Materials from raw stock	Materials from processing		
I	Straw Paper	Cyl. & Four.	Cyl. Wet & C. F. Wet	Straw Fiber & Silicates	Lime	No. I & II	Acid
	Strawboard	Cylinder	Cyl. Wet	Fiber-Silicates	Lime & Size	No. II	Acid
II	Bond, Writings, Ledger	Fourdrinier	Wet & Press	Rag Fiber & Wood Fiber	Rosin, Starch, Alum, Slime	No. II & III	High grade soap or powder
III	Book-Coated	Fourdrinier	Wet & Press	Wood Fiber, Clay or Filler, Rosin	Filler, Agalite, Clay	No. II & III	High grade soap or powder
	Bristol Board	Cyl. & Four.	Fine Cyl. Wet & Press	Fiber	China Clay, Rosin, Starch	No. II & III	High grade soap or powder
IV	Manila, Jute	Cyl. & Four.	Cyl. Wet & Press	Shieves, Fiber	Agalite, Rosin Clay, Alum, Starch	No. II & III	High grade soap
	Sand Paper	Cyl. & Four.	Cyl. Wet & Press	Shieves, Dirt, Tarry Material, Fiber	Asbestine and Fillers, Rosin, Alum	No. II & III	Soap or powder
V	Chip & Newsboard	Cylinder	Cyl. Wet & Press	Dirt & Fiber	Rosin & Alum	No. I & II	Acid & soap or powder
	Binders Board	Cylinder	Cyl. Wet	Dirt & Fiber	Size	No. I & II	Acid & soap or powder
	Counterboard	Cylinder	Cyl. Wet	Dirt & Fiber	Iron Oxide, Clay, Rosin, Alum	No. II	Acid & soap or powder
	Roofing	Cylinder	Cyl. Wet & Press	Rag Fiber, Dirt Tarry Material	Iron Oxide, Fillers	No. I & II	Acid, soap or powder
	Hard Fiber	Cyl. & Four.	Cyl. & CF Wets & Press	Dirt & Fiber	Rosin, Clay	No. II	Acid & soap or powder
VI	Newsprint	Four. & Cyl.	CF Wet & Press	Fiber, Rosin	Alum, Rosin, Color	No. I & II	Soap or powder
	Cyl. Tissue		Cyl. Wet & Press (Pick-up)				
	Other Tissue Grades	Fourdrinier Harper Yankee	CF, FF, or SF Wet & Press. Harp. Wet	Fiber	Size	No. III	High grade soap or powder
	Pulp	Wet Machine	Pulp Felts	Fiber	Rosin Residue, Bleach and cooking liquors	No. I	Water
VII	Leather Board	Cylinder	Cyl. Wet	Dirt, leather		No. I—Singe	
	Heel Board	Cylinder	Cyl. Wet	Dirt, Fiber	Size	No. I	Water—soap

The comparative table as drawn up visualizes in a general way the varying conditions and divisional characteristics affecting the problem of felt cleansing, and is largely self-explanatory.

It should be noted, however, in this connection that the acid referred to therein is a dilute acid, the degree of dilution dependent upon its method of application and also upon the commercial acid used, the latter point simply serving as a reminder of the wide difference between the two or three commercial acids used for this purpose as regards their pure acid content.

The point of distinction made as between "soap" and "high grade soap", is that the latter term indicates the freedom of the soap or powder from uncombined alkali. A comparatively small degree of "causticity" resultant from the release of the uncombined alkali contained in the soap or powder when thrown into solution ot uncontrolled temperatures and with very soft water will while producing a very active solution for cleansing, involve serious felt fabric injury.

As regars temperatures which are not mentioned in the table, it is found that "hand hot" is the general rule for the best maximum temperature for felt washing solutions, particularly when using commercial soaps and powders. This conclusion is especially true from the standpoint of felt injury.

the felt itself and the complete destruction of its water shedding qualities.

There is serious danger of injury resulting directly from too exhaustive a treatment in the washing machine. All woolen fabrics in warm soap solution shrink. This shrinkage should be checked carefully by washing in cold water, and the felt should be dried under slight tension prior to replacement on the machine. A felt after washing should not be drawn up to the same place on the stretch roll at which it stood when removed from the machine. This statement also holds true in roping felts. No one can definitely tell to what extent this slight over stretching may injure a perfectly good felt. The worst of it is that the injury is done and cannot be repaired.

The Heavier Stocks

Class IV. Under this class, including Manila, Jute, Sand paper, etc., we find cleansing problems of both cylinder machines and Fourdriniers, since these grades of paper are about equally divided in their manufacture between the two types mentioned. Manila and Jute grades are usually included under Classification II, since the felts used in their production fill up in much the same manner as in other grades of paper where relatively large quantities of rosin, alum, starch and filler are used. Felts are roped and removed from the machine for more complete washing in the felt washer, using good grades of mild soap. This last method is to be recommended for this class almost entirely. Felts used on Sand paper are subjected to still more serious trouble, because of the class of furnish used and its consequent impurities. The latter result from the very use to which the rope has been put, as well as from foreign particles in the rope itself. Any grade of stock which carries pellets of dirt and tarry material will naturally make more constant felt cleansing necessary. This is particularly true in the case of sand paper felts.

Class V. This group comprises the products generally made on multi-cylinder machines. The character of the raw materials used causes deposits in the felt of fibers, dirt, and tarry substances. The method of washing felts in this group should be under Classification I. The felts are generally soured with acid application by means of a shower. Not only is the felt cleansed, but the mould covering also. Some mills throw a diluted acid solution on the felt just ahead of the first couch but even distribution cannot be assured, and in the event of the use of too strong an acid solution a weak spot in the fabric is very apt to result. On roofing much stress is put upon the use of the whipper. This fact is directly responsible for the short life of this kind of felt.

The method of washing the press felts on the multi-cylinder machines is that of Classification III, and the higher the grade of the machine product the better the grade of soap or powder that should be used.

Newsprint and Tissues

Class VI. The cleansing of paper makers' felts used in the manufacture of newsprint and tissue papers presents new and varied problems. Here the main trouble is caused by substances which form a part of the raw material used in the actual paper manufacture. Such resinous residues are usually the source of continued difficulty. Day in and day out the felts come in contact with a paper furnish which, so far as is humanly possible, is exactly the same, namely free from foreign dirt, but containing practically all of the gummy substances found in spruce, balsam, and other coniferous woods so commonly used in the manufacture of these papers. On the whole such impurities, while they gum up, do not cause the destructive results usually noted from the abrasive action of particles of dirt found in the manufacture of the coarser grades of paper. The rapid motion of felts on these machines makes a continued washing very desirable. These felts then fall naturally under division I of our first Classification. Such continuous washing is now being carried on at some of the mills in this and foreign countries with varying degrees of success. Such felts should be cleansed by the application of mild alkaline solutions. Solutions for use in this manner should be of a concentration and temperature sufficient only to allow partial saponification of the resin residues and consequent solubility in the subsequent water washings, but not of a strength so great as to cause serious injury to the felt fabric. This necessitates a study of individual conditions at each and every mill in the country. No definite concentration or temperature can be recommended. Each mill must solve its own problem aided by the felt manufacturers.

Leather Board and Heel Board

Class VII. The whipper and water shower find a greater use in cleansing felts used in the manufacture of leather board and heel board than in any other to which a paper makers' felt is put. These felts fill up with dirt, pure and usually unadulterated. A good soap and water washing seems to be the most effective way to cleanse this class of felt. The present-day whipper is not entirely satisfactory as a cleansing medium. The pressure and friction of each bar on the whipper as it strikes the felt tends to rub the dirt into the texture of the fabric, hence a time is reached when further whipping is useless, and the felt must come off. The pressure on the shower pipes used in cleansing such felts is at present being studied at several mills throughout this country, and at this time no definite statement can be made. Each mill must determine its own best operating conditions.

A factor not previously mentioned, but which is of considerable importance, not only as regards felt impregnations but also felt cleansing under all the Classifications which have been considered, is that of the water used for the furnish and also for washing purposes. Consideration of this factor both from the physical and chemical standpoint is important. First the physical conditions, i. e. the organic matter in suspension, general turbidity, etc., and the chemical characteristics such as iron compounds in suspension and hardness caused by magnesium and calcium compounds, are a very important contributing cause of felts "filling up". Second, the effect of the foregoing water characteristics should be studied in relation to its efficiency in felt cleansing.

A careful consideration and balancing of the factors in this problem of felt washing is fully justified in the results to be secured, namely a minimum of injury to the machine clothing which will be practical as compared with the maximum production of paper and the least possible interruption of the operation of the paper machines.

As previously stated this article is not written as a panacea for the cure of all felt cleansing troubles. It is not entirely a recitation of conditions as they actually exist, not perhaps as they should be. It is handed to those who are interested with the hope that herein a suggestion or an idea may have been dropped, which when properly investigated and controlled will serve as some slight aid to the man in the paper industry and to felt maker alike.

Fuel Waste in the Paper Mill

An intensely Practical Article on How Efficiency of Power Plant May be Increased and Money Saved

Written for PAPER

By JAMES T. BEARD 2nd.

RELIABLE operation of his mechanical equipment and continuous, uninterrupted plant production are the goal of every paper mill manager. During the war, when the quality and quantity of fuel for the power plant was a very uncertain factor and when the quality of labor was equally uncertain, the factors made their presence felt in no uncertain way.

Desirable as economy and efficiency were to the man at the mahogany desk and his subordinates in the operating end, they were necessarily relegated to the background to take care of the more important problem of keeping the mill running at all costs.

Today the fuel situation is somewhat different. Coal of the quantity and quality suited to the plant requirements are available. In many cases, however, the fuel cost is an item that merits serious consideration. Many plants have, therefore, taken steps to study their power requirements and their power plants in particular, with a view to reducing preventable losses and to making each ton of coal produce its adequate share of paper tonnage.

HERE'S SOMETHING ALL CAN LEARN

The importance of the power plant in the paper mill cannot be over-estimated. Here is something every official, every superintendent, every man interested in mill efficiency should know. Mr. Beard is peculiarly well equipped to write authoritatively on this subject. He knows the game from the ground up and he can write interestingly. Don't pass over this page until you have read this article.

Labor Below Normal

ALTHOUGH the labor situation today is nowhere near so acute as it was five years ago, it is still far below normal as to quality and intelligence of the men seeking employment. The prospects for considerable immediate improvement along these lines, moreover, are not overly bright. Managers, superintendents and operating men in responsible charge of mill operation and production have, therefore, taken a keener and more active interest in the supervision of their power departments, hoping in this way to instruct their men in the proper handling of their equipment.

There are many practical, common-sense methods, for example, which can be put into effect in the boiler room in the handling of the fires, and which if followed consistently will yield substantial savings in fuel, with practically no financial outlay for additional equipment. That these methods are not used to any extent in nine out of ten plants is probably due to one or more of three principal reasons.

First, means for determining and maintaining the the best operating conditions for maximum economy are not usually provided. Too much dependence is placed upon the human element and upon the judgment of an unintelligent fireman.

Second, even where proper means is provided, it is human nature to backslide. Unless these best operating conditions are maintained by constant and intelligent supervision, the greatest possible economy is never realized.

Third, the boiler house is too often considered as little more than a necessary evil. The less said about it the better, so long as the mill continues to turn out paper. In the normal operation of the boiler room of a paper mill, the biggest fuel loss is that represented by the amount of heat carried up the stack with the hot flue gases. In some cases this amounts to as much as 30 per cent of the total amount of coal burned. A fifteen to twenty per cent loss is common.

In other words, if the plant is burning 30 tons of coal a day, from five to ten tons of that coal is carried up the stack as a dead loss. This is a big loss and the question naturally arises how can we know how much is being lost in this way; how much of this can be saved; how can we save it?

One of the chief sources of heat loss, or fuel loss, in the flue gases is the presence of more air than is actually required to burn the coal on the grates. The highest furnace temperatures are obtained when there is no excess air in the gases of combustion. Such a condition is purely theoretical and is never realized in actual practise. In order to burn coal with sufficient rapidity to satisfy the steam demands in the average boiler plant, it is necessary to force or draw air for combustion through the bed of fuel with a velocity depending upon the rate that the coal is being burned. If the coal were in a finely divided powder, it could be thoroughly mixed with the incoming air and each minute particle would be completely surrounded by just sufficient air to burn it. Very little excess aid would be required under these conditions.

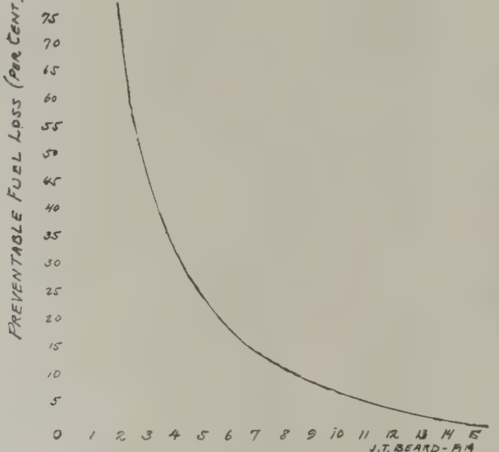
The Hand Fired Plant

IN the hand fired and stokered plants, however, these conditions do not exist. Coal is fed to the grates in fairly sizeable lumps. The process of burning a lump of coal is much slower than burning the same weight of coal in powdered form. Considerable free air escapes, therefore, without doing any useful work in the process of combustion.

Under these conditions all we can hope for is to keep this amount of excess air down to a minimum. It is possible to get continuous and efficient furnace combustion with about 30 to 35 per cent of excess air in the furnace gases. It is not practical to do better than this. We may therefore say that the preventable fuel loss is zero, when the excess air does not exceed 30 per cent.

How then are we to determine how much of this excess air is present and how are we to learn when this "best condition" is reached? This can best be illustrated by taking the case of a pitcher of cream. If we pour in a cup of water we have diluted it in proportion to the amount of water poured in. Let us say the mixture of cream and water contains 30 per cent water and 70 per cent cream. It matters not, then, how we look at it. The measure of dilution is the same, whether we say we have 70 per cent of cream or 30 per cent of water.

So with the furnace gases. The cream of the furnace gases is the carbon dioxide resulting from the complete combustion of the coal with the oxygen in the air. If there were no dilution with excess air we would have approximately 20 per cent of Carbon Dioxide (CO_2) plus some unimportant inert gases, such as nitrogen, etc. If this furnace gas is diluted now with 30 per cent of excess air, the percentage of CO_2 drops to 15. In other words, 15 per cent of CO_2 is just as much a measure of air dilution as if it read the actual percentage of air itself. And we choose to read our excess air in terms of CO_2 because it is much simpler and quicker to test the gases for CO_2 than it is to test them for air. Excess air is, therefore, measured in terms of the percentage of carbon dioxide in the furnace gases.



The detrimental effect of excess air is the reduction of the flue gas temperatures. The result is the same as if the furnace doors were opened. The air drawn into the fire box from the boiler room would immediately cool the temperature of the furnace and would kill the steaming capacity of the boiler, in spite of the fact that you might be burning the same amount of coal on the grates as before the door was opened.

Get the Furnace Hot

TO get the greatest amount of heat out of the hot gases and into the water in the boiler it is necessary that the furnace be as hot as the brickwork will stand. This is nothing but common sense, which even the humble housewife appreciates. What is the use, therefore, of burning up good coal to get this heat, if the temperature is going to be cooled down by the admission also of a lot of unnecessary cold air. The answer is that excess air represents a dead loss.

Thirty per cent of excess air, which we have said is necessary, represents a furnace temperature of approximately 3000 degrees Fahrenheit, and we have assumed that it also represents maximum economy and zero loss. It is not unusual, however, to see this amount of excess air as high as 100 per cent and even higher. Such a condition would be represented by a CO_2 reading of 10 per cent, instead of 15, and would correspond to a furnace temperature of about 20 deg. F. and a preventable loss 6 per cent of the to fuel burned.

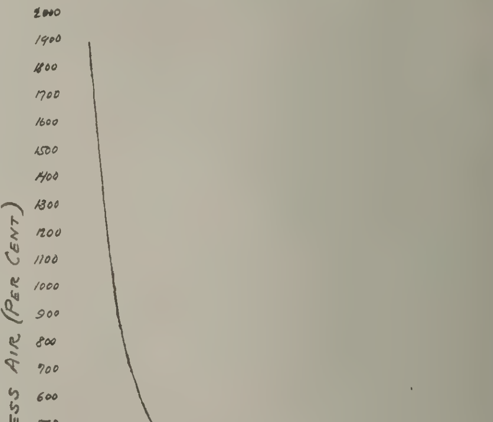
Most industrial power plants are poorly operate especially the boiler rooms, and particularly in pap mills. Flue gas averages of five and six per ce while very low, are found in some mills. Such reading would not be tolerated in any plant, if t true condition of things were known, but unfortu ately accurate knowledge of the operating conditio does not always exist. Such conditions would corre pond to nearly 300 per cent excess air in the furna gases, a furnace temperature of 1200 deg. F. of abo 24 per cent of the fuel burned.

The sources of this excess air are usually poo conditioned fires. Where proper attention is not giv to the methods of firing, the fuel burns through mo rapidly in some spots of the bed than in others. these spots are not immediately covered with fre fuel, they afford a free passage for unnecessary exc air. A number of these spots in the fuel bed m cause the efficiency to drop in a very few minutes un contions similar to those just described are reache

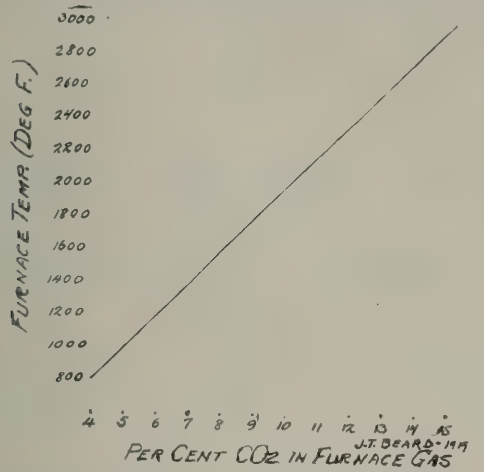
How to Fight Excess Air

DARK spots in the fuel do not necessarily me that these spots are actually black. True, they a darker than the live parts of the bed, but, if the la ter, is very bright, the dazzling effect on the eyes m prevent the detection of the dark spots, except throu the use of dark glasses. They are there neverthel and are an ever-present source of waste which is bo unnecessary and preventable.

Another source of excess air is the cracks and cre ices in the boiler setting itself. The draft within t furnace will suck or draw air from the boiler roo through every crack available. If this air does n pass through a live fuel bed, it merely dilutes a cools the furnace gases without doing any useful wo and causes a corresponding drop in the boiler econom Cracks in the boiler setting may be detected by hol ing a lighted candle to the setting wall. Wherever t flame is drawn into the brickwork, you may r assured that there is an air leak into the furnace.



We have spoken of the value of CO_2 readings an indication of the excess air present and as a me ure of the preventable loss in terms of the per c of the total coal burned. We have also called attention to the comparative ease with which these readings are taken. Perhaps the simplest of these devices is the Hand Orsat, which is a compact instrument, easily operated and read by the chief or his assistant.



This instrument is used for taking occasional readings during the day, for checking other instruments of the recording variety, and for running tests simple or elaborate with a view to determining the best draft conditions, thickness of fuel bed, etc., for maximum combustion efficiency.

It is hardly to be expected that any man can by guesswork determine when the boilers and stokers are performing their best work. Not without suitable instruments can accurate knowledge of the operating losses just described be gained. Of course, much can be done by insisting upon the porper conditioning of the fires and the stopping of the leaks in the boiler settings. To realize the fullest measure of economy, however, more reliable information is essential.

Tests of the Flue Gas

SAMPLES of the flue gas for the purpose of testing are usually taken from the flue connection to the boiler, taking care to insert the sampling tube in the center of flow of the gases. The resultant reading is an indication of the total dilution of the gases of combustion with excess air. This includes excess air which filters through a poorly conditioned fuel bed, as well as that air which leaks into the setting through cracks in the brickwork.

If the sampling tube is inserted directly into the furnace, the reading will indicate how much excess air is due to the poorly conditioned fuel bed alone. The discrepancy between the two readings will be charged to excess air due to setting cracks.

The Hand Orsat, useful as it is, can serve only to give isolated readings and requires the constant attendance of an operator. Where continuous and automatic records are desirable, so that an accurate check can be had of the firing conditions over the entire period of twenty-four hours, suitable instruments are available. These CO_2 recorders make a record on a daily chart. If each boiler is equipped with its individual recorder complete, continuous and automatic records are possible. Possible coal savings, however, do not always warrant the expense involved in such an installation. Where the expense of individual recorders is not advisable, a single recorder may be installed to serve two or more boilers. The piping of the sampling tubes may be so arranged that the recorder may be switched from one boiler to the other from day to day. While such an arrangement does not furnish such complete information as the previous method, it does materially assist in maintaining a high average of boiler efficiency in small power plants.

Sampling cans for the purpose of collecting continuously and automatically an average flue gas sample from a single boiler unit, are frequently used in conjunction with a single CO_2 recorder. In this way a continuous chart record is available showing the daily performance of any one boiler. In addition, the sampling cans are tested by means of a hand orsat at the end of each 24-hour run and an average reading is obtained for each of the other boiler units.

Charts Show Effect of Air Excess

THE charts accompanying this article show the effect of excess air upon furnace temperatures and upon the percentage of carbon dioxide in the flue gases. They also indicate approximately the amount of fuel loss corresponding to different percentages of CO_2, or excess air, as the case may be. They should prove valuable to the operating man who wishes to check boiler operation with a view to reducing the preventable loss resulting from excess air to a minimum.

In any boiler room the largest preventable loss of fuel is due nine times out of ten to the presence of excess air. Fortunately this loss is also the most easily eliminated and merely involves taking those common sense steps in the handling of the fires that that will prevent air leaks and in stopping of cracks in the setting itself. It is unusual to find any plant where the preventable fuel loss due to excess air is zero. If suitable means are not available, however, for getting accurate knowledge of the magnitude of this loss and for determining when the best operating conditions are attained, proper steps cannot be taken for preventing this fuel waste. Accurate knowledge, however, is not the only essential. The knowledge must also be correctly interpreted in terms of practical operating conditions. It must then be applied to each individual case and intelligently supervised, with a view to maintaining the best results 24 hours a day.

Old Company Buys New Property

John Carter & Company, Inc., 595 Atlantic Avenue, Boston, one of the oldest and largest paper houses in Boston, has purchased the mercantile property at 230-232 Purchase Street from Fred Holdsworth and Robert D. Farrington.

The company purchases for its own occupancy and after making extensive alterations and improvements to care for its business, will occupy the same. It is expected that it will move into the building about March 1. For many years the company was located in the Federal-Pearl street district but requiring additional room, moved to Atlantic Avenue a few years ago. Their new purchase will bring them further uptown in the wholesale district.

The building just purchased is a four story brick and stone structure and each floor contains 1328 square feet of floor space. The total tax value of the property is $40,000 of which $26,600 is on the land. It is understood that the purchase price was considerably in excess of this figure.

Western Union Humor

It has been reported that a certain well known young married man of this community burst into the office in the wildest excitement recently and wired his wife's relations as follows: "Twins today; more tomorrow!"

Get To Work

"An' what's your job around here, young feller?" asked the farmer of an official in a big city railroad station.

"I'm the train caller," answered that dignitary.

"Well, call me one, then. I'm in a hurry."

The plant of the Gulf Paper Co., at Crichton, Ala., has been damaged by fire to the extent of $200,000.

PAPER MANUFACTURERS TO REDUCE VARIETIES

Chamber of Commerce Frank in Making Request of Paper Men to Reduce Varieties to 56

AN appeal to manufacturers throughout the country to give more attention to the elimination of excess varieties during 1924 is contained in a pamphlet just issued by the Fabricated Production Department of the Chamber of Commerce of the United States.

The department suggests that manufacturers who have not already done so undertake to simplify and standardize their products at the next inventory period.

"Wouldn't it be very much worthwhile," the pamphlet asks, "if the amount of physical, clerical and other effort of inventory could be cut in half, or probably even more; the period of plant shut-down greatly reduced; and all the figures available quickly without undue burden on the force? Have you thought of the possibilities along these lines afforded by the elimination of excess varieties and duplications which you may be producing and carrying in stock? But increased facility of inventory taking is only one of the manifold benefits and savings that are certain to accrue from a simplification and standardization project, all of which point to that all important goal—the elimination of avoidable industrial waste.

"Certain applications and possibilities become evident on first thought. For instance, such items as raw materials, purchased parts, component parts, finished product, cartons, packing cases, terminology, performance, brands and finishes are all amendable to the simplified practice treatment. Consider also the extent to which centralized effort is reflected in the functioning and operation of not alone the fabricating, but of the purchasing, the accounting, the engineering, the stock-keeping and all the other departments."

Reductions made by some manufacturers of fine papers have limited the lines to 56 instead of 377.

TWO GREAT PAPER MILLS IN NORTHWEST

One Is Just Starting Construction and the Other Is Close to Actual Operations

TWO great paper mills, one nearing completion, and one in the first stages of construction, are now added to the great string of mills in the Northwest, where a wide scattered area of rare wealth of timber, and energy creating facilities invite the establishing of still greater number of mills.

The Columbia River Paper Mills at Vancouver, Washington, will be a whirl of productive industry early in the spring. Steel work is now being done, for the superstructure, which will be built entirely of steel and glass with a three foot tile base. All cement work is completed, and acid towers, vats and foundations for both building and machinery are in place. When complete this plant will have 22,000 square feet of glass.

A sawmill cutting 125,000 feet daily is now in operation, employing 125 men. The waste from this mill will furnish material for pulp and papermaking, as well as sawdust, bark and edgings for feeding boilers and generating electric power for both sawmill and paper mill. The sawmill is electrically driven as will be the paper mill, when completed.

A huge recent shipment of machinery weighing 260 tons contained chiefly the great paper making machine, made especially for this concern by Bagley & Sewell of New York. Vegetable parchment, wrapping paper and newsprint in sheets 136 inches in width will be made at the rate of fifty tons per day in sheets 136 inches wide. Deep water frontage and railway freight terminal advantages endower the Columbia River Paper Mills with unexcellable shipping power both as to exporting and importing, in United States and with foreign countries.

The common stock of this mill is now issued for $1,250,000, considerable of which is being held in reserve.

The newer project—the Portland Pulp and Paper Company commences construction work the first week of January. The president and vice-president, R. H. Mills, and Joseph Kaster, are now in the east placing orders for the vast amount of equipment which the project will require. Located in direct conjunction with the Monarch sawmill, this mill will consume what has hitherto been total wastage.

Other mills of the Northwest, long established and now in operation at The Crown-Willamette Paper Company, operating five mills in Oregon, and rated as the second largest paper manufacturing firm in the world, the Hawley Pulp and Paper Company, which was recently destroyed by fire, but which will be rebuilt immediately, The Oregon Pulp and Paper Company of Salem, the Everett Pulp and Paper Company of Everett, Washington, the Parafine Paper Company of Sumner and Port Angeles, Washington, the Washington Pulp and Paper Company of Port Angeles, Washington, the Cascade Paper Company of Steilacoom, Washington, the Inland Empire Paper Company of Spokane, Washington, and in British Columbia the Powell River Paper Company, the Howe Sound Pulp and Paper Company and Beaver Coal, Pulp and Paper Company. With the exception of the last two named concerns, which have not been successful in the past, this entire great industrial group is operating on a thriving basis.

UNNECESSARY DESTRUCTION OF TREES

J. B. Dillon Writes in Protest of Wanton Use of Christmas Trees, While Authorities Ask Conservation

FROM many sections of the United States, the press has narrated what wonderful big trees were used by municipal authorities for Christmas celebrations.

To give you an idea of how some of the City Fathers act toward the timberland we quote from the Rocky Mountain News of Denver, Colorado:

"The large Christmas tree to be used in decorating civic center for the yuletide is sixty feet high and said to be the finest obtainable in the foothills near Denver. This tree will be the center of a group of 275 or 300 smaller trees to be used in the display, the City Engineer says."

In addition to the big fellow there are two trees forty feet high and several hundred ranging from five feet to twenty-five feet.

But it was Christmas and surely no one would take any exceptions to such actions?

What became of the two trees sixty feet high and the myriad of smaller trees the same people cut down last year for the same purpose?

Chopped up and used for fire wood.

Now there is no reason why these trees cut down for Christmas decorations,—it would be better if they had not been cut down—could not have been made into "perpetual trees" so as to use the same trees for years to come. Yes it is practical and any good mechanic could arrange it so that the trees might be cut into sections and mechanically arranged for reassembling, and this is the way and means every Christmas tree should be made regardless of size and stop the abusing of forests.

What was the idea of using several hundred small trees?

To stand them against the iron posts holding the boulevard lights, and as soon as the holidays are over, dump them into a pile and burn them. This is wanton waste of our timber and that's all there is to it. In the day light the display loses much of its beauty, but in the night time it is a veritable fairyland, not because of the trees, but because of the many varied colored incandescent lamps, a fact that adds a further condemnation to the utter disregard for the conservation of our timber.

While all of this tree cutting was going on, Governor Sweet of Colorado issued a proclamation urging all citizens of the state the importance of conserving our great natural resources, the proclamation coming after complaints had been made that the forests were being ravaged by people cutting down trees to be used during Christmas.

No wonder people smile at such proclamations when the foregoing is considered, but it is a serious matter and the city must set an example that shows conservation and not destructiveness.

While the Governor's proclamation was being read, the Denver Post comes out with the headline: "National Forests Unhurt By Cutting of Christmas Trees." The item recites that "only trees that would die if permitted to remain on the forests are being cut." Maybe?

It is just these kind of trees that should be used in the making of Christmas trees of the "automatic-fold-up-kind," and the promiscuous and every yuletide cutting must stop, for the days are gone when we can refer to an object as cheap, by saying: "Do you think it grows on trees?"

Denver is used as an example because this article was written in Denver, where the correspondent saw with his own eyes, but what refers to Denver applies to many, many cities and if this article carries out its purpose millions of young trees wil be saved yearly and when that is done we are on the road to rich and lovely forests.

J. B. Dillon, Denver, Colorado.

New Ideas on Paper Fillers

A Leading European Paper Maker Presents Some Unusual Information for American Paper Makers

By H. POSTL BIEDERMANNSDORF, *Vienna, Austria*

N the early days of the paper industry, when the chlorine bleaching process had not yet been discovered and paper was sold by the sheet and not by weight, it s the practice not to use any loading or filling materials a mineral nature or at most only a very small proporn of the same. When it was done it was for the purse of making a white sheet of paper and rendering the rface of the same printable. Starch was principally used a filler for this purpose. Starch is detected in the lest known papers, those that come from Asia, both der the microscope and by the iodine test. It was only wards the middle of the last century that a few large elgian paper mills commenced to use mineral fillers in der to save using so much of the most expensive paper ock in making a paper of a given weight. This practice on spread to other countries and simultaneously thereth paper began to be bought and sold on the basis of eight. At the present time starch is still used in the per industry but not for the same purpose, but to make e mineral filling materials stick to the paper fibers more osely.

Use of Starches

The starch that is used for this purpose is most freently made from potatoes and less frequently from wheat d rice flour. Potatoes contain approximately twenty rcent of starch, while wheat contains 60 percent starch d rice contains as much as 75 percent. The chemical mposition of starch is represented by the formula, $H_{10}O_5$. Hence according to its formula it bears a close lation to cellulose. In the raw condition starch does ot stick to the paper cellulose very well. Hence it is lvisable to make a paste out of the starch by boiling the me after from one to two percent of caustic soda has een added.

Before the war the large paper concerns in both Austria d Germany imported most of the mineral fillers used in eighing paper. After the war due to the broken conections between the outside world and these countries d the decrease in the value of the mark and the high st of transporting these materials from the outside counies into Germany and Austria, more attention was paid the domestic supplies of mineral fillers. Explorations ere undertaken and deposits of various minerals were loted in both countries, so that at the present time there e indications that there is a plentiful supply of these aterials for the paper industry and there is no need for nporting these materials from foreign countries. Mineral llers are accordingly available not only for loading coarser rades of paper such as packing paper but also for weightg the finest kinds of high grade papers. A short decription of the various fillers used, their properties and e effects produced by their use follows:

Asbestos

The word, asbestos, derived from the Greek, means literlly uncombustible. This mineral, which is found in thick nd fine fibers, an elastic aggregation of white, green, or rown colored masses, has a silky or waxy lustre or possesses no lustre at all. At times it has a fatty feel, and at ther times a dry feel. It occurs mostly in combination ith hornblend, augite, mica and serpentin, with which inerals it forms a very firm combination. It appears in ct to grow out of the same. It is widely distributed, owever it is found in just small masses imbedded between e rock.

Russian asbestos possesses the longest, finest, softest bers of all the known kinds of asbestos. Asbestos is used r making fire-resistant fabrics, paper, insulating pads, for ning hot air and steam pipes, boilers, etc. It has a great any different uses besides as a filler for paper. The short fiber asbestos, which is unsuited for manufacture of expensive articles, is ground up and used as a filler for different kinds of paper.

Blance Fixe

Blance fixe is made in a chemical way by the precipitation of barium salts with sulphuric acid. The sulphate of barium, which is made in this manner, is composed of extremely fine particles. The most careful grinding and levigation of heavy spar, barium sulphate, will not give a material possessing such fineness as the precipitated substance. Blance fixe is dazzling white, absolutely clean and is found on the market in a paste form, mixed with approximately 38 percent moisture. It must always be kept in the moist condition before being used and it is necessary to see that the material that is received by the plant is moist and not dried out. The reason for this is that the dried material, when mixed with water, does not give a mixture in which the particles are so finely distributed as when the moist material is diluted with water. This means that good results cannot be obtained with this material in filling paper.

Because of its properties, which have been described above, it gives the paper a high gloss a pure white appearance and renders its surface perfectly suitable for printing. It is for this reason that blance fixe is used so largely in making art printing papers and other high grade papers.

Gypsum

Large quantities of gypsum are found in Austria and Germany. It is found in various stages of purity and mineral condition.

It is important to note that a good paper filler cannot be made from any and every variety of gypsum. Only gypsum of older formation can be used for this purpose. The earlier varieties of gypsum are used in the building industry and in making fertilizer compositions. The separation of the stone from the other extraneous rocks is accomplished by blasting and the broken stone is sorted. The stone that is to be used for making brilliant white, the paper filling material, in slabs about 15 to 30 centimeters thick, is freed of a thin black crust which sticks to both sides of the same. The blacker this crust, the whiter the color of the gypsum. Hence an indication of the quality of the stone is afforded by its external appearance.

Pure gypsum has the formula $CaSO_4\text{-}2H_2O$. It contains 32.56 percent of CaO, 46.51 percent of H_2SO_4 and 20.93 percent H_2O. The product that is made from the raw material by grinding, screening through a silk screen has the afore mentioned composition. It is absolutely neutral, and in spite of its high specific weight of 2.2 to 2.4, it is rather bulky.

By burning the gypsum almost all of the 15 to 20 percent of the water of crystallization contained therein is removed. The product then has the following composition:

97.7 percent of sulphate of lime
0.75 percent of caustic lime
0.71 percent of magnesia
0.84 percent of water.

The calcined gypsum is then ground to the state of a fine powder. This product, which is known as brilliant white, is very bulky and moreover strongly alkaline. The alkaline can be eliminated by mixing the product with lenzin, a sort of kaolin or by allowing the material to remain for a considerable length of time in storage. There are also several little technical tricks which can be employed to remove the alkalinity of this product. These are kept secret by the various manufacturers who use them.

Lenzin is used in admixture with the burnt gypsum to give a composition product which is very cheap and which is employed in filling the cheaper grades of paper and pasteboard. It may also be used alone and is simply added to the beater without any preliminary treatment, being shaken over the surface of the pulp as it is being beaten.

Use of Brilliant White as a Filler

Neutral brilliant white is a very advantageous filler for very fine and moderately fine grades of papers and cardboards. In most cases the filler is stirred up with water without heating. It is then screened through a number 70 to 80 screen and fed directly into the paper beater. In certain individual cases brilliant white is digested in combination with potato or rice starch. The jellylike mass is filtered, before it is added to the paper stock, by passing through a fine sieve.

The special form of kaolin, lenzin, as well as brilliant white exceeds in whiteness the brightest kinds of kaolin and from this standpoint it is even no less white than blance fixe.

In former times the use of both these fillers was always bound up with a certain loss, as one part of gypsum is soluble in approximately four hundred parts of water. But when the practice was introduced of recovering the back waters and using these over again in diluting the stock on the paper making machine the loss of filler in the waste waters did not amount to very much.

Kaolin

The first use for kaolin was in the manufacture of chinaware and porcelain. Kaolin is used to a very large extent in the paper industry both as a weighting material and as an ingredient of compositions used in making coated papers. It is formed by the decomposition of alumina-containing silicates and for the most part from heavy spar. There are various grades of this filler according to the color, fineness, purity and feel of the product.

Kaolin is found in nature mixed with other substances, which are impurities and which have to be removed in order to obtain a clean, pure product. This is accomplished by levigation. This is generally done by mixing the kaolin, as it comes out of the ground, with water and passing the milky mass through screens and sand catch boxes. It must be remembered that the water that is used for this purpose must be free from impurities, especially iron salts, lime, etc., in order to obtain a pure product. The pure kaolin is composed of approximately 46 percent of silica, 40 percent of alumina and 14 percent of water. This corresponds to the formula, H_2 Al_2 Sl_2 O8. The specific weight of the mineral is 2.2.

Chalk

There are various grades of chalk mined in European and other countries. Each locality produces a chalk of different properties than the next. Finely levigated chalk is used as a constituent of compositions used in making coated papers, while the lower grades of this mineral are employed in loading cheaper grades of paper, such as packing paper, wherein the color of the filler is no object.

The finest grade of pure white carbonate of lime is made artificially by dissolving burnt marble or limestone in water and introducing a stream of carbon dioxide gas. A precipitate is formed which settles to the bottom of the reaction vessel. This is known as precipitated chalk. When it is mixed with fine white talc in the correct proportions and added to the beater, it will give a paper with a very high degree of opacity. This type of paper can be employed in very thin sheets for printing on both sides, without the print being visible on the other side of the paper.

Magnesium Carbonate

Magnesium carbonate is obtained as a by-product in making table salt from ordinary rock salt. The mineral magnesite, which is used largely in the manufacture of refractory crucibles, consists almost entirely of magnesium carbonate. Dolomite, which is a mineral very widely distributed throughout the earth, is a combination of magnesium carbonate and calcium carbonate.

Artificially made magnesium carbonate is a dazzling white, fluffy powder and forms an important constituent of cigarette paper. This filler does not prevent the ready combustibility of the paper.

Serpentin

This mineral is a filler which has not been used ex sively except in the few years that have elapsed since war. The most suitable form of this mineral for us paper making is the so-called serpentin asbestos, w contains talc as well as asbestos. When the serpenti ground into a fine powder, its color is white with a ce greenish cast. It has a feel like a lean kaolin and er the market under the name of asbestine. The degre hardness of this substance is 4 to 4.5, the specific we is 2.5 to 2.7. In the purest condition its chemical stitution is repreesnted by the following formula: H SI_2 O8 plusH_2O. In other words it is a silicate of n nesium with water of crystallization.

Heavy Spar

This mineral, which belongs to the sulphate clas used mainly in the manufacture of packing papers. H spar is $BaSO_4$ and possesses a hardness of 3 to 3.5 a specific weight of approximately 4.5. A certain propor of the finely ground powder, and it is important to g the mineral as thoroughly as possible, is added to diffe papers to increase the weight of the same. In wrap sugar and various foods such as cheese and sausage, author tells of personal experience with the use of a w ping paper, which was so heavily weighted with h spar that the paper looked just like lead foil in stea paper. In fact the percentage of ash in the paper wa percent.

Talc

Talc is a very popular filler for paper but it is not wi distributed in nature. The chemical composition of substance is $3MgO. 4SiO_2. H_2O$. The value of the p uct in paper making is determined principally by the c of the product. It is found colored a dazzling w green, gray, red or yellow. The talc that contains c is not suitable for use as a filler for paper. The pres of limestone or chalk, calcium carbonate, in the tal easily ascertained by allowing a drop of dilute sulph acid fall on the product. The evolution of gas indic the presence of the carbonate in the mineral.

Clay

The clays that are found in nature are divided up two classes, those that can be melted and those that are sistant to fire. Each class of clay possesses proper which render it particularly useful for various purpo Loam and clay which are seldom found in the pure w state in nature, and are mostly colored gray, blue, yel or reddish brown, are not very suitable as paper fi on account of this fact. However the cheapest of the terial makes its use advisable when manufacturing cheaper grades of paper in which the color is not an portant consideration. Hence these materials are emplo in weighting packing papers, grayish colored paper other kinds of paper and cheap cardboard.

Turbine for Uncas Paper Board Compa

The Uncas Paper Board Company, of Norwich, Conn., awarded contracts for a 750 horsepower k. w. steam tur which will be installed early in the new year. The en plant, employing about 150 persons, will then be oper entirely by motors.

During the short time in which the present management been in charge of the plant, the company has expended a $160,000 in improvements and the company is now ship about 200 tons of paper board daily. The product is principally for lithograph work and for high grade bo car signs, etc.

The company is particularly well located with facilities shipping its product from its own wharves as well as rail. The company is cooperating with the Chamber Commerce of Norwich in an effort to have the governm widen and deepen the channel of the harbor so that ships larger tonnage may be used.

Accept New Building

A new building to be known as the Alfred H. Hend son Hall of the College of Forestry has been accepted the regents of the University of Washington. Mrs. Hend son, making the gift in memory of her husband, has gi the University $250,000 for this purpose.

New Developments in Paper Making

Water Resistant Paper

A new British Patent, which is described in the World's aper Trade Review, tells of a process for making a water esistant paper by the use of neutral salts, such as calcium hloride and magnesium chloride, which in certain conditions xercise an acid action. Relatively large quantities of colloidal ubstances such as casein, animal glue, etc., may also be added, nd also coloring matter, and glycerine, sugar, etc., which later render the paper flexible.

The casein or animal glue may be added in the rag engine, r paper may be impregnated with a solution of acid-acting ubstances, formaldehyde and glue. The solutions may be pplied cold or heated, and either by impregnating or by oating. The coating process may be carried out in stages, he different reacting ingredients being applied on opposite sides f the paper. The product may be coated with varnish, asphalt, itch, tar or the like, and threads, fabrics, and the like may e imbedded in the covering layers thus put on. A cardboard r millboard may be produced by uniting several water resisant webs, or these webs may be combined with other untreated aper webs.

Chemistry of Wood

In softwoods the water, ether and alkali extracts are higher n the heart wood than in the sap wood, and as result of this ondition the cellulose and lignin are correspondingly lower n the heart wood, with the exception of the lignin in white edar. On the basis of the extractions hard woods are divided nto two groups. The first contains those woods which have igh extractives in the heart wood, and the second contains hose woods which have high extractives in the sap wood. The former have a high cellulose content in the sapwood, he latter in the heart wood. Acetic acid by hydrolysis is igher in the sap wood than in the heart wood of both soft nd hard woods. In the article, which reports this series of nvestigations on the composition of some American woods, here are given a number of detailed analyses of American woods together with the ratio of methoxyl to lignin in the ven dried wood both for sap woods and heart woods. See Ind. Eng. Chem., 1923, 1055-1056.

Paper Sizing With Bark Oil Soap

An interesting paper has been published in the Papierfabrikant on the use of tree bark oil soap as a sizing material for paper. Tree bark oil is a dark green mass consisting of fats and resins which is extracted for the bark in the course of its preparation as a fodder material. The substance melts at a temperature of 35 degrees C and in the crude state it requires for saponification 5.70 per cent of carbonate of soda. The soap is prepared by heating with the necessary quantity of soda ash for several hours, or more rapidly with caustic soda, the product from one hundred grams of the oil being made up to 150 grams. The soap in the proportion of six per cent and four per cent of sulphate of alumina has been employed successfully in the sizing of paper pulp.

Larger quantities give a harsher paper and the pulp tends to be sticky from excess of resinous matter. A peculiarity of the papers sized with bark oil soap is the fact that the ink resistance of the sized paper increases with age, so that an improvement is noted two months after the paper has been sized and a very marked difference is noted after a few years. This is attributed to the progressive oxidation of the unsaponifiable matters that are contained in the emulsion of the soap. Bark oil soap is not such a powerful sizing agent as cottonseed oil soap, but whereas the latter produces a very marked diminution in the tensile strength of the sized paper, as is the case with the aluminum soaps of all the fatty acids, the decerase is far less in the case of the bark oil size, due presumably to the fact that this material contains resinous constituents as well.

Digesting Wood

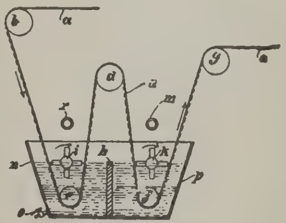
United States Patent No. 1,478,614 is concerned with a process of digesting wood pulp. This patent is assigned to the A-S, Cellulosapatenter of Christiania, Norway.

It is mainly concerned with a method of preventing the separation of the calcium compounds from the digesting liquor due to the liberation of gas from the same. This takes place during the indirect digestion of the sulphite cellulose. The process consists in maintaining the liquid under a pressure in the digester during heating greater than the pressure permitting the liberation of gas from the liquor. In this way substantial quantities of gas are prevented from escaping from the liquor and the liberation of calcium salts is prevented. There is accordingly no thick scum of such salts formed on the surface of the liquor.

Cleaning Paper Felt While in Operation

The device which is seen in the accompanying illustration is patented in United States Patent No. 1,478,712 and is employed for cleaning the paper felt on paper making and cardboard machines while the latter are in operation.

The apparatus consists of a container for the cleaning liquid, a paddle wheel which is mounted in this container and which is adapted to rotate in the cleaning liquid, a number of guide rollers for guiding the felt to be cleaned through the cleaning liquid. These rollers are mounted partly above the liquid container and partly within the same at a lower level than the paddle wheel. They are arranged with respect to the paddle wheel in such a manner that the felt is guided at some distance from the paddle wheel around the latter which is facing the paddle wheel with its rear side.



Paper Insulated Electric Cables

The invention, which is described in British Patent No. 203,566, is concerned with a process for making paper for insulating electric cables, in which the paper before its application to the cable in the form of the usual spiral covering is impregnated with a sizing material, such as animal size, casein, albumen, or dextrine, by passing it first through a bath of impregnating solution to cause a partial impregnation. Then the paper is passed between press rollers either in the sizing material or after the treatment with this material to cause it to be pressed into the paper and bring about complete impregnation. The sizing material is then hardened by means of alum, chromium salts or formalin, mixed with the sizing material, or by subsequent treatment with it.

The manufacture of insulating paper for electric cables may also be carried out by the addition of an alkali to the sizing bath. Caustic soda may be used for this purpose. It is also possible to use acids, as for example lactic acid, for the purpose of improving the absorption of the sizing material by the paper and of increasing the fluidity of the sizing bath.

The paper, after it has been treated with the sizing material, may then be cooled by means of cold air currents. Then again after the paper has been thoroughly impregnated with the sizing material it may be given a coating of varnish. It is also possible to mix an easily emulsifiable substance, such as soap or castor oil, with the sizing material.

In the insulation of electric cables with paper, winding the paper on to the conductor in the wet state and drying it by passage through a hot impregnating bath is one way in which the process may be applied.

Doings in Canadian Paper Field

HAMMERMILL BUYING IN CANADIAN FIELD

Company Paid Out Million Dollars Last Year for Purchase and Handling of Wood

THE Hammermill Paper Company, of Erie, Pa., is an extensive buyer of pulpwood in the district around Port Arthur and Fort William, Ont. For the past twenty years the company has bought wood at the head of the lakes, all through contractors and jobbers. M. Cochrane was appointed general manager four years ago and established an office in Port Arthur.

They now handle exportable wood practically whenever offered and drive, raft and load it on vessels themselves. Last year the company, through their offices in Port Arthur paid out practically one million dollars for the purchase and handling of wood. Eighty-five per cent of this wood was bought from the settlers who were paid in full for their product when delivered on the banks of the various streams. The firm gave employment to about 600 men all winter and approximately 100 all summer. This coming season they are purchasing about the same quantity of wood, a portion of which will come down the Kaministiquia River with the wood of the Fort William Paper Company, some down the Current River and quite a portion from points on Lake Superior as far as Rossport.

1000 Lumberjacks and No Job

One thousand lumberjacks are without employment and have not received their wages for several weeks as a result of the financial difficulties of the Bay Sulphite Company, which culminated a few days ago in a petition in bankruptcy being filed and a temporary guardian being appointed by the Quebec registrar. Hon. Honore Mercier, minister of lands and forests has dispatched two inspectors to learn the facts and deal with the situation. Reports are to the effect that the lumberjacks are in a serious predicament and are pouring into the little town of Chandler from the forests of Gaspe and Bonaventure counties, where they had gone for the company for the winter season.

Hooke Succeeds Dickinson

Harry Hooke, who for some years has been connected with the paper department of Brown Brothers, Limited, paper converters and manufacturing stationers, Toronto, has been promoted to the management of the paper and binders' supplies department of the firm, in succession to Harry Dickinson who, with B. G. Whitelaw has purchased the paper agency business of the late Aubrey Hurst, Toronto.

American Capital in Canada

It looks very much as though American capital were about to go in earnest into pulp and paper manufacturing in the Maritime Provinces. At present there is that of the Bathurst Co., at Bathurst, N. B. All other mills being producers merely of pulp. The Bathurst mill began producing paper during this last year. It is reported that the Hearst interests are negotiating for a paper mill down by the Atlantic, and that they also want some large tracts of timber land. If Hearst is in earnest he probably will have no difficulty in getting what he wants.

The American Perforated Wrapping Co., at Sheet Harbor, N. S., is a concern that looks like undertaking rather large operations. It controls over 60,000 acres of land at Sheet Harbor, and in the spring will begin the construction of a ground wood mill with a capacity of 25,000 tons of pulp per annum. It is also thought that on the Canadian side of the St. Croix River at St. Stephen, N. B., the Hollingsworth and Whitney interests of Maine will build a paper mill. It was originally planned for the American side, but the Canadian side has now been selected.

Increases Its Profits

The Wayagamack Pulp and Paper Co., increased its profits by more than $500,000 during the year ending November 30th, and after meeting all charges had something left for dividends. There was a net profit of $206,356, equivalent to more than 4 per cent on the capital stock. The report indicates the greatly improved conditions in the kraft pulp and paper industry that ruled during the greater part of 1923.

Extend Water Storage

The Pacific Mills at Ocean Falls, B. C., have extended their water storage facilities by raising their dam an additional 15 feet and thus have added a new 6,500 h. p. unit to their hydro plant.

Complete New Development

The Spruce Falls Company has completed a 2,500 h. p. hydro-power development at Kapuskasing on the river of the same name in Ontario, the power to be used in connection with a pulp and paper plant. The Dryden Paper Co., has also completed an installation of 1,400 h. p. on the Wabigoon River.

Installs New Units

In the Kenora, Ont., district the Brooks-Backus Co. has installed two additional 1,200 h. p. units in its plant at Kenora, and with four more units of the same capacity that will be installed early in 1924, the station will have a capacity of 12,000 h. p. for use in connection with the company's pulp and paper mill.

Sends Out 1924 Greetings

A. Storrs & Bement Company have sent out New Year's greetings as successors of Amariah Storrs. W. F. McQuillen, treasurer says, "To have succeeded to the friendships handed down through the seventy-seven years is a heritage which we of the present generation greatly value. It is with sincere pleasure that we send you this greeting as an expression of our great appreciation."

PROTEST ON REMOVING CHRISTMAS TREES

Canadian Pulp and Paper Men Opposed to Wholesale Use of Taking Christmas Trees From Canada

A NUMBER of prominent pulp and paper executives have been investigating the inroads made on young trees that would eventually serve as pulpwood, and have found that more of these young trees were removed for the Christmas of 1923, than ever before, this being applicable to the woods of eastern Canada. In most instances the farmers who chopped the trees mostly fir, cedar and spruce, received not more than five cents per tree for their labor. And the same trees were retailed in the United States for from seventy cents to one dollar, and very frequently the price went higher.

The attention of the Canadian government is being drawn to the wholesale cutting of these young trees, which extends from the first of October until the middle of December. In some sections, two-thirds of the young fir, sedar and spruce have been removed. It is not until recently, after the damage inflicted by the general removal of the young trees, had been pointed out, that those who had been active for the embargo on exportation of pulpwood to the United States betrayed interest in this subject.

As yet individuals who have manifested a remarkable interest in the embargo have not yet memorialized either the Canadian government or the various provincial governments, to enact laws that would reduce to the minimum, the cutting of the young trees, for export to the United States, for the Christmas season.

From the provinces of New Brunswick, Nova Scotia and Prince Edward Island alone, more than 1,500,000 young trees were exported to the United States for the 1923 Christmas. Instead of being so vehement for an embargo, proponents for such a measure should interest themselves actively in the suppression of the traffic in Christmas trees, and thus confer a real benefit on the Canadian pulp and paper industry, as well as contributing something tangible toward forest conservation.

For some years, the advocates of the embargo have been inactive while hundreds of thousands of the valuable young trees, suitable for pulp in a few years, were cut down and exported annually. Apparently, they objected to pulpwood crossing the line to United States mills, but did not object to young trees that would serve as pulpwod, being shipped across the boundary. Even today there is nothing like a vigorous effort to ban the exportation of the Christmas trees. only one paper mill in these provinces,

Adds to Timber Limits

It is learned that the Belgo-Canadian Paper Company, Quebec, has been adding to its timber limits by the purchase of several blocks of Woodlands in Northern Quebec. The company has already owned 15,000 acres of freehold timber limits, and controlled about 1,800 square miles of leasehold limits, containing about 6,000,000 cords of pulpwood. The additional purchases have added from six to ten years to the life of the company's limits and has been further increased by the purchase of about 30,000 cords of pulpwood during the present year, which has relieved the company of the necessity of cutting that much wood from its own limits.

U. S. Financiers Still Acquiring

The change in the receivership of the Whalen Pulp and Paper Company in British Columbia, whereby E. M. Mills, of the Zellerback Paper Company of San Francisco, has been appointed, is interpreted in Vancouver as meaning that the last pulp concern in British Columbia under Canadian financing may pass to the conrol of United States interests. The Pacific Mills, one of the best pulp manufacturing plants on the coast, was acquired by American financiers for a comparatively small figure and creditors of the Whalen company are said to be fearful that the Whalen plant may be sold under similar circumstances. The Whalen company had reached a point where three pulp plants were ready to feed a paper mill, but difficulties in financing the paper mill were experienced.

May Tax Pulpwood Lands

Indications are that the Nova Scotia government intends to increase the taxes on pulpwood lands in the near future. This will affect the United States companies which own pulpwood areas in that province. It has been proposed that a nominal tax of about one or two dollars per acre be placed on the land and an additional tax, pro rata with the pulpwood that is removed, each year. That the provincial government intends to raise the taxes on the timber seems to be assured. The rule in the past has been to tax the land each year at full value, which means that the more quickly the pulpwood is removed from the lands, the less taxation for the owners of the pulpwood areas.

Optimistic on Business

Price Brothers & Co., Limited, of Quebec, are optimistic concerning future business conditions in Canada in the paper field. In a circular just issued and sent to their customers they say: "During the past year a return of confidence brought with it a general settling down in trade. Both demand for goods and enquiries steadied up, permitting the trade, without undue risk, to purchase for its requirements. This return to the new normalcy reflected advantageously upon industries in general in this country and brought about a more regular meeting of obligations. Were it not for the unsettled political situation in Europe we could look forward to the coming year with greater confidence; but we believe, nevertheless, that the year 1924 will be as good as 1923, if not somewhat better."

Only Woman Head of Paper Mill

Miss A. M. Thorpe, who has been managing the pulp and paper company at Fort Miller on the Hudson for the last fourteen years, is the only woman managing a paper mill.

When her father, John Craig, died fourteen years ago, Miss Thorpe became president, treasurer, and general manager of the company, and also held a controlling interest.

The veteran wood products men of the upper Hudson had their doubts about the success of the girl, who had just graduated from a musical course at Wellesley, and were dubious about her ability to run the plant in a thoroughgoing manner.

However, Miss Thorpe soon convinced even the most skeptical that she had come to stay, and her management is now taken as a matter of fact.

The Fort Miller Pulp and Paper Mill is a ground wood mill with two seventy-two inch paper machines and a force of fifty men; constituting the largest mill in Fort Miller. It was destroyed by fire last May, and is now being rebuilt with additional grinders.

Miss Thorpe is an unusual and interesting figure in the industrial community of Fort Miller. At her desk from 8 in the morning to 6 at night she lives up to her doctrine of, "Give it your best efforts," and her success is an affirmation of that creed.

Herb Making Good

J. Herb, a well-known Ontario paper manufacturer who went west a few years ago and established the Westminster Paper Mills in British Columbia appears to be making good. Word from that province is to the effect that the company's tissue products are in demand in various parts of the globe. At the present time, it is stated, the mill is filling an order for thirty tons of tissue and fruit wrap for China. It has an order from New Zealand for one hundred tons of tissue and fruit wraps, while 11,000 cases of paper are on order from the Prairies. The C. P. R. liner Empress of Canada, recently in Vancouver on a trip around the world, also sent in a special order for immediate delivery of 3,000 2-lb. rolls of tissue.

Muir Takes New Job

Harry L. Muir, a well known Toronto paper salesman, who was formerly with the Don Valley Paper Mills, Toronto, and latterly with the Brantford Stationery Company, Limited, in Brantford, Ont., is now on the road for the Toronto Canadian Pad and Paper Company, Limited, Toronto. Mr. Muir started in on his new job on Jan. 1 and will cover Ontario, Quebec and the Maritime Provinces for the Toronto concern.

Gave Turkey to Employes

L. R. Wilson, the newly appointed general manager of the Abitibi Power and Paper Co., Iroquois, Ont., arranged for the delivering of a turkey at Christmas to every employee of the company, whether in the mill, woods, merchandising, townsite, forestry or transportation departments, and who is a householder in Iroquois, the Wye or Little Canada.

Buys Timber Limits

Reflecting the effect of Quebec's embargo on the export of pulpwood from Crown lands, the St. Maurice Paper Company has purchased from its parent company, the Union Bag & Paper Company of New York, a block of 500 square miles of timber on the St. Maurice River. Because of the embargo, this pulpwood could not be shipped to the American mills of the Union Bag & Paper Company, and it was better that the timber should be transferred to the St. Maurice Company. This puts St. Maurice in the position of owning one of the largest blocks of timber lands of any of the companies. The land is being paid for by the St. Maurice Paper Company by the issuance of 2,500 shares of its stock to Union Bag as an initial payment and it is stated that a further block of stock may be issued to pay for contemplated new paper machines. The company has a paper production of only 115 tons of newsprint per day, and it markets a considerable quantity of ground wood, sulphite and sulphate pulp to its parent company and other parties.

Making Sixty Tons a Day

The Thunder Bay Paper Company, Port Arthur, has made considerable progress during the year. The industry, under its present management, started up in February of last year, turning out at first thirty tons of pulp a day. Now the plant is doubled, and 60 tons of air dry pulp are sent out from the mill, being all shipped to the company's mills at Wisconsin Rapids, Biron, Appleton, and Stevenson, Wis. Since last year several improvements have been made. The wood room has been completed, and two barking drums have been installed, replacing the old knife cutters. The installation of three 800 h. p. Westinghouse motors for the grinder is finished, and there is also a new transformer room and switchboard equipment. The next activity in which the company will embark will be the construction of a dock and light railway 500 feet long. Manager R. N. Youngman states that the company will erect a paper mill just as soon as the limits can be obtained.

Issue Handsome Book

The Buntin Gillies Company, Limited, manufacturing stationers and paper dealers of Hamilton, Ont., and one of the best known paper firms in Ontario, has just issued a very neatly gotten up book under the title of "Prospects," the chief feature of which is a short history of the firm from its foundation by the late Alexander Buntin, in 1848, up until the present. The book sketches the marvellous growth the concern has made and is a valuable contribution to the historical data concerning the growth of the paper industry in Canada. Besides the chief warehouse at Hamilton the firm has a branch warehouse at Ottawa under the management of John F. Neville.

Sulphite Mills Closed

Practically all sulphite mills in the Watertown section are closed down. Manufacturers here say that the price at which deliveries of sulphite pulp can be obtained from Europe make it cheaper to close down the local plants.

Construction News

CONSTRUCTION NEWS

Rumford, Me.—The Oxford Paper Co., is installing additional equipment at its plant and plans to complete the work in about 60 days. It is purposed to increase the output to about 340 tons, gross, per day, in the line of fine book and coated stocks.

Chicago, Ill.—The Pharmacy Paper Box Co., 2334 West Polk Street, is taking bids on a general contract for the erection of a two-story and basement addition, 50x100 ft., estimated to cost approximately $30,000. It will be equipped for general production. A. L. Himelblau, 30 North Dearborn Street, is architect.

Miami, Fla.—In connection with its new local sugar mill in the Everglades, now practically completed, the Pennsylvania Sugar Co., Delaware Avenue, Philadelphia, Pa., plans for the establishment of a mill for the production of paper, operating as a subsidiary works, utilizing the cane waste and pulp for raw material.

Canton, Ohio.—The plant and business of the Old King Cole Papier-Mache Co., has been acquired by R. E. MacKenzie and associates. The new owners plan to reorganize and expand the works, to be operated under the name of Old King Cole, Inc. The capital of the company will be increased.

Port Edwards, Wis.—The Nekoosa-Edwards Paper Co., has plans nearing completion for the installation of additional equipment at its mill for considerable increase in output. This will make the ninth machine to be installed by the company, and will be provided with an electric drying system. It is expected to be ready for service in the spring.

St. Maurice, Que.—The St. Maurice Paper Co., Ltd., a subsidiary of the Union Bag & Paper Co., New York, has taken over timber properties of the parent organization and plans to develop the land as a source of raw material. The tract totals about 500 acres, located in the so-termed Crown lands, and is estimated to contain more than 1,000,000 cords of pulp wood.

Port Huron, Mich.—The Dunn Sulphite & Paper Co., Detroit, Mich., has plans in progress and plans to take bids in the near future for the construction of its proposed new mill on property recently acquired on the St. Clair River, estimated to cost close to $500,000, with machinery. A list of equipment will also be arranged.

New Companies

New York, N. Y.—Siegel & Gabrelow, Inc., has been incorporated with a capital of $50,000, to manufacture paper boxes and containers. The incorporators are H. and L. Siegel, and J. Gabrelow. The company is represented by Leight & Neckritz, 36 West Forty-fourth Street, New York.

Philadelphia, Pa.—The Colonial Mfg. Co., care of the Corporation Guarantee & Trust Co., Land Title Building, representative, has been incorporated under Delaware laws with capital of $100,000, to manufacture paper and cardboard products.

Newark, N. Y.—The Klefeker Mfg. Corporation has been incorporated with a capital of $1,000,000, to manufacture paper boxes and containers. The incorporators are C. B. Klefeker, R. A. and C. T. Bloomer. The company is represented by Hubbell, Taylor, Goodwin & Moses, attorneys, Rochester, N. Y.

New York, N. Y.—The Bloch Brothers Paper Co., has been incorporated with a capital of $30,000, to manufacture and deal in paper products. The incorporators are C. H. and B. Bloch. The company is represented by G. B. Garfield, 42 Broadway, New York.

New York, N. Y.—The Columbia Bag & Paper Corpo tion has been incorporated with a capital of $50,000, manufacture paper bags and containers. The incor rators are W. E. Quayle, S. H. Brown and C. B. S ders. The company is represented by T. M. Day, Broadway, N. Y.

Financial

New York, N. Y.—The Nyando Pulp & Paper Corpo tion, Room 1006, 5 Nassau Street, has called a meeti of stockholders on Jan. 14, to arrange plans for a d solution of the company. The corporation is form under Delaware laws; Lloyd Church is secretary.

New York, N. Y.—Gerald Jackson has been appointed ceiver for the Bauer Paper Box Co., Inc., 440 Lafaye Street. The company is said to have assets of $10,0 and liabilities of $18,000.

Quebec, Que.—Following recent financial difficulties, re ganization plans are being perfected by the Bay Sulph Co., proposing to place the company on a good financ basis and developing operations to a point of full cap ity. The company has bonds outstanding to a to amount of $4,056,000, preferred stock, $2,642,615, a common stock of $5,000,000.

Plant Operations

Practically every fabricating plant in the Chicago, I district is running at full capacity, with sizeable orders hand for a number of weeks to come. There is also good demand for paper bags in this section, and mills this character are also on a full operating schedule, givi employment to regular working forces.

The Glatfelter Paper Co., York, Pa., distributed ca presents to employes at its mill at Spring Grove, near Yo on Christmas.

Business Opportunities

The Joint Committee on Printing, Capitol Buildi D. C., will take bids until Jan. 28, for furnishing paper f Government public printing and binding for a period six months, dating from Mar. 1, 1924, or for one ye from this time, deliveries to be f. o. b., Washington. T approximate estimated quantities include:

3,040,000 pounds standard newsprint; 9,250,000 poun machine-finish book paper, 1,000,000 pounds plant-fib machine-finish book paper; 1,050,000 pounds antique bo paper; 200,000 opaque machine-finish book paper; 150,0 rag opaque machine-finish book paper; 1,550,000 poun rag machine-finish book paper; 2,990,000 pounds supe calendered book paper; 10,000 pounds rag supercalender book paper; 125,000 pounds halftone book paper; 480,0 pounds coated book paper; and quantities of white a blue writing papers, bond papers, tissue paper, cardboa red and white molding paper, manila paper, blotting pap pressboard, etc., all as per specifications and schedules file at the office of George H. Carter, public printer, Was ington, D. C.

The Bureau of Foreign and Domestic Commerce, Was ington, D. C., has information regarding a company Geneva, Switzerland, in the market for a quantity of ca bon paper, Reference 8592. Full information on request.

Mississippi Wood Unsatisfactory for Pulp

The Kennebec Pulp Mills, Skowhegan, Me., have co cluded a series of experiments to determine the practic value of certain Mississippi wood for pulp use. The m terial was White Bay, Magnolia, Black Gum and Tulep totaling about 9 cords in all, and was found not adapted to ground-pulp purposes. The pulp produced is now being tested for sulphite, to ascertain if the material will be useful in other lines.

Personal

Eugene C. Betz, vice-president of the Consolidated Paper Co., Monroe, Mich., has been elected president of the Monroe Exchange Club, formed of local business executives.

Obituary

Brayton R. Clark, treasurer of the Malone Paper Co., Malone, N. Y., died Dec. 27, of heart disease. In addition to his duties as treasurer, he has been acting head of the company for a number of years. He was an official of several other local industrial companies and prominent in Malone civic life, having been president of the village from 1908-1912.

Esthonian Paper Industry

Trade Commissioner C. J. Mayer, Riga, November 20

There were operated in Esthonia in 1922 five large and four medium-sized mills, according to data of the statistical bureau of the Republic of Esthonia, producing mechanical ground wood, chemical pulp, and paper. During the year these mills utilized 16,369 cords of birch wood, 16,271 short tons of mechanical ground wood, 12,442 tons of chemical wood pulp, 343 tons of waste paper, and 636 tons of rags. The production of the mills during the year was 7,135 tons of mechanical ground wood, 1,499 tons of roofing cardboard, 8,020 tons of mechanical pulp, and 28,450 tons of paper, including 541,875 pounds of cigarette paper. Imports during the year for the requirements of the paper industry were 1,098 tons of wet and 8,896 tons of dry mechanical pulp, 5,348 tons of dry and 50 tons of wet chemical wood pulp, and 11 tons of rags. Exports during the year of raw materials amounted to 261 tons of chemical pulp and 501 tons of cotton, linen, and other rags.

To Standardize Boxes

Paper board and box manufacturers making glove boxes, particularly those in the middle west, will undoubtedly notice a marked change in demand for their products during the coming year subsequent to the action taken by the National Association of Leather Glove Manufacturers at their recent convention in Chicago. In line with the general tendency of various industries to curtail waste in production, as has been urged by Secretary Hoover, the association, through definite committee approval of the manufacturers selling to the jobbing trade and manufacturers selling to the retail trade, voted their approval and suggestion to the trade that six colors be considered henceforth as standard for glove boxes: Dark water green, black, gray, yellow, red and white. It was also voted to allow that jobbers who declined goods shipped in any one of the mentioned box colors could be shipped goods in bulk or in chipped boxes.

The question of a box factory to serve the industry was also discussed along detailed plans for the formation of a corporation composed of the members of the association for the purpose of effecting such a move, but no definite action in this regard was taken.

Wants Information on Casein

The United States Tariff Commission announces that upon consideration of certain matters developed during the public hearings held in the investigation of foreign and domestic costs of production of casein, it has concluded that additional data are desirable for a determination of the question of the difference between cost of production in the United States and abroad.

The Commission has accordingly directed certain supplementary inquiries to be conducted in the United States and in the principal competing country. Those inquiries are now being carried on simultaneously and as soon as they are sufficiently advanced to permit a date to be fixed, the Commission will give formal notice of a supplementary public hearing at which the interested parties will be given an opportunity to be heard upon the particular points involved in the supplemental inquiries now being made.

A COMPANY LOAN ASSOCIATIONS

The Nekoosa Port Edwards Building and Loan Association Has Declared Its First Dividend

THE Nekoosa Port Edwards Building and Loan Association being in business only four months, or since September first, declared a dividend at its meeting of December 24th held in the office of the Association at the Nekoosa State Bank, at Nekoosa, Wisconsin.

This dividend is on the basis of six per cent per annum, and for the four months in business will net those who have stock two per cent for the short time their money has been invested.

This dividend will be paid in cash to the fully paid up stock and will be paid in the way of a payment on account to those who are buying installment stock.

There are a large number of employees of the Company who have subscribed for both the installment and paid up stock, and arrangements have been made so that wherever a man wishes a certain amount deducted from his pay check and credited to his account in the Building & Loan Association this can be done.

To date the Association has made loans amounting to over $11,000.00 and there is in the Treasury at this time a goodly balance.

Ten houses have already been constructed in the Village of Port Edwards and loans have been made on four places in Nekoosa.

The forming of this Building & Loan Association serves a two fold purpose:

First, so that every man in the employ of the Company can own his own home, buying it on practically the same basis as he now pays rent and in a short time he will be the owner, and second to encourage the saving of money and making it possible to get double the interest of the ordinary Bank.

BUSINESS TO GO ON

Whitmore Company Will Be Pushed Ahead in a Business Way By Receiver

GEORGE WEBSTER, assistant treasurer of the Whitmore Manufacturing Company, manufacturers of surface coated, enameled and plated paper, has been appointed temporary receiver for the company by Judge Nelson P. Brown of the Superior court. This action followed the filing, by the Fitchburg Paper Company of a petition containing a claim of $23,242.34 for merchandise and notes given in payment for merchandise against the company.

John S. Begley, counsel for the Whitmore company, says that the company is solvent with assets of $450,000 and indebtedness of about $283,000. He further stated that there are no quick assets for the company and the appointment of a receiver will permit the issuance of receiver's certificates of indebtedness for the purpose of carrying on the business, the certificates being subject to the approval of the court. The action will also relieve the company from the pressure of creditor's claims. It is understood that the action is a friendly one.

John J. White, a former mayor of Holyoke, is treasurer and general manager of the company. The company was organized about 40 years ago and business at the plant is declared to be fairly good.

Paper Man Gets Divorce

Mrs. Jeanette A. Elliott, wife of Charles E. Elliott, 729 Westgate Avenue, University City, Mo., vice president of the Mack-Elliott Paper Company, of St. Louis, was granted a divorce at Clayton, Mo., St. Louis County, December 20. Alimony was fixed at $150 a month and a reasonable amount for the education of Jeanette, Mrs. Elliott's young daughter by a former marriage. The couple were married January 15, 1915.

Incorporated For $600,000

The Shawmut Paper Box Corporation of Cambridge, Mass., formerly the Shawmut Paper Box Co. of Cambridge, has been incorporated with a capital of $600,000. The incorporators are R. O. Pearson of Boston, Clinton W. Bennett of Medford, Mass., and Gardiner W. Chase of Belmont, Mass.

The Editorial Page

Away With the Bugaboo

CHEER up, folks, the paper business is not so bad. Don't let the doldrums get you, and keep the goblins tied up with the dog. You might be in Germany, or Austria, or Russia trying to do business in the paper trade. Here at least the money you handle is worth something. Have you ever stopped to realize that the total volume of production for the year 1923 will excel that of any year with the exception of that wild sky-rocketing year of 1920, when everybody went mad?

That is something to put in your pipe and smoke, for almost all of that paper manufactured was sold and shipped.

Sure, there were failures during 1923. There were more failures than in some years past. But this is not 1923. This is 1924. It is time to ring out the old and ring in the new.

Imports were too high and exports too low. And a lot of other things in the world outside of the paper industry were wrong too. Everyone speaks favorably of the year 1924, even those hard-boiled business judges who can only see the dollar sign connected with everything.

This magazine does not say that the millennium is here, nor that the paper industry will luxuriate in a Utopia. It does not say that every manufacturer and dealer in paper must dance about like a bubbling Pollyanna seeing nothing but gold and sunshine and everlasting contentment. But this magazine has a deep and abiding faith in the fundamental soundness of the paper industry for the entire year.

It is time to crawl out of the bomb-proof cellars. It is time to do things. It is time to push ahead to new fields.

The world is not saturated with paper. The world is finding a myriad new uses for paper. And the world will continue to absorb the production of the mills in a surprising fashion.

There will be no recurrence of the hectic days of 1920 when paper drove manufacturers and dealers crazy. But there will be a steady, wholesome demand, with prices holding firm and generally advancing.

We will bet a ginger cooky on this guess.

So get out of the dumps, Mr. Paper Man, and get busy.

And PAPER wishes you success, once more.

What Do You Want?

PAPER wants to publish a magazine that will interest you. What do YOU want in this publication?

What special feature, what department do you want us to run

What are you particularly interested in? What parts of the news of the trade do you want us to play up?

The paper industry is so full of so many things that it is hard to pick.

We want to please. Let us know what you want.

There Is Meat Here

EVERY man connected with a paper mill cannot help but feel the significance of those two articles in this issue on "Fuel Waste in the Paper Mill," by James T. Beard, 2nd, and "Cleansing of Papermakers' Felts" by C. T. Hamill. Both are by authorities on those particular matters and both mean money for every paper mill the officials of which read and act.

Both of these men have taken vast and painstaking pains to make these articles worth cash to the paper mill. Both are important matters in a mill. And they have succeeded in presenting worth-while articles.

Read them.

Wroe's Writings

A REAL mission has "Wroe's Writings," the pepful monthly organ of W. E. Wroe & Company, of Chicago. It is one of the livest and most sprightly house organs published by a firm in the paper trade. It has life, philosophy, facts. What more could a house publication want?

The little publication appears in 16 pages, has as much spirit as a comedy magazine, has an almost inimitable personality and also imparts knowledge of the company in a friendly, cooperative way. It is a tonic to the trade.

Where Is That Joke?

DON'T forget to turn in that little episode in the life of a man known in the paper industry which will put the trade in good humor. PAPER will pay $5 as a prize for each one. Not only is it worth while from a financial standpoint, but good humor and good feeling is what the paper industry needs right now—as it will always need it.

So turn in that "good one" you heard—who knows, it may be a "winner." However, don't let it injure in a personal or business way.

Forestry in the Paper Industry

Conducted by J. R. Simmons, Secretary Forester,
The New York State Forestry Association

SIDELIGHTS ON McNARY BILL

Chief Forester Makes a Statement Regarding Pending Bill—New Facts Are Brought Out

CHAIRMAN R. S. Kellogg has recently given to the members of the National Forestry Program Committee some important viewpoints expressed by the Chief Forester and by Senator McNary, on the matter of appropriations for purchase of national forests, for planting on the same, and for establishment of experiment stations of the Madison, Wis., type. In response to his inquiry as to how these items are to be taken care of, Chief Forester Greeley replied:

> "First as to forest purchases. Under the present legislative situation and parliamentary precedents, there is no limit upon the annual appropriation which Congress may make for acquisitions under the Weeks Law. It can appropriate any amount in any year that it sees fit. If an authorization for such purchases were enacted as an item of the present forestry bill, that would automatically establish a maximum beyond which no current appropriation could be made. Unless such an authorization is very liberal, it might readily prove within the course of a few years to be a handicap rather than a benefit. The present budget provides one million dollars for such purchases during the fiscal year 1925 and, with public sentiment so generally in favor of this policy, I anticipate material increases in the Weeks Law appropriation in the future. If we could now obtain an authorization, in the McNary bill, of five million a year, that would doubtless be of value as emphasizing and promoting the national policy of forest acquisition. An authorization for a smaller amount, particularly the two million authorization provided in the Clarke bill, would in my judgment be more apt to become a handicap rather than a benefit.
>
> "The same situation exists as to authorization for federal research and for planting on the National Forests. No additional legislation on these subjects is needed. Congress now has authority to appropriate each year as much as it pleases for any of these purposes. An authorization that is not liberal in consideration of the needed future expansion of these activities would be apt to become an obstacle in no great length of time. From the legislative standpoint we now occupy a favorable situation in the absence of a limit upon what Congress may appropriate for these purposes. Unless we could secure in a general forestry bill authorizations based upon future expansion of this work up to ten years hence, I think our situation would be less favorable than it is now.
>
> "Senator McNary does not wish to load up his bill with a large total of authorizations; and I think that he is wise in this point of view in consideration of the trend of Congressional opinion. Both Congress and the Administration are, in general, opposed to large authorizations. I fear that if authorizations dealing with these subjects were included in the bill, a considerable unfavorable reaction toward it would result; and furthermore fear that in the outcome such authorizations would be cut down to limits that would prove handicaps rather than benefits.
>
> "For the above reasons it has seemed to me desirable to limit the authorizations carried by the bill to cooperative work in fire and to the new activities proposed in forest education and cooperative planting with the States."

In response to a similar inquiry Senator McNary says:

> "The items with respect to the Madison Laboratory and the forest experiment stations will be carried in another bill that comes before the standing Committees of the Congress.
>
> "It is my judgment that we should keep the proposed Reforestation legislation as free from such items as possible however important they are."

Yields in Southern White Cedar

The popular commercial principle of quick turnovers is exemplified in forest management through the study of maximum annual yields of different species. From yield tables thus determined the turnover, or rotation period of the forest crop can be estimated.

Yield tables for southern white cedar are under preparation at the Forest Experiment Station at Asheville, N. C., by C. F. Korstian, silviculturist, assisted by W. B. McMillan. These tables will show the volume production that may be secured in this region at different ages and will thus indicate the earliest profitable age for cutting the trees, or rotation period for this crop. Future management of southern white cedar among private growers who are following efficient methods on their woodlands will be based on these tables.

ANOTHER USE FOR MOSS

Can Determine the Danger Point of the Fire Hazard—Recently Described in Paper

PAPER has described in this department an instrument recently developed by the Forest Service and known as a hygrometer, for determining the danger point in fire hazard on the national forests. Strands of hair are ordinarily used in this instrument to record delicate humidity fluctuations. These strands are being replaced by a grey moss selected from forest trees in the Douglas fir region, and the experiment station at Stabler, Wash., has discovered that when this humble plant is placed on a balance with a pen arm attachment, it records relative humidities as satisfactorily as a humidity curve pen.

The studies now going forward illustrate the very immediate response of inflammable material in the forest to moisture changes in the air, and at the same time show the great need for close observation of moisture conditions as an aid in determining the approach of such exceptional dryness as is responsible for our present tremendous fire losses.

On Preparation of Booms

The need for great care in preparing booms for the towing of logs is shown by replies to a questionnaire sent out by the Woodlands Section of the American Paper and Pulp Association. One man of long experience in the rafting of pulp wood points out particularly that great care is needed in making up rafts, to prevent spills. "Our best insurance on a raft being delivered promptly," says that authority, "is a reliable boom man on the job, who will not take any chance in making up a raft to save himself extra work." A description of tugs and other towing equipment, some of which is built for high power operation, is included in a report made to the membership of the section.

Sweden Takes New Step

Sweden has recently promulgated a new forestry law which brings into force better measures of preservation and sets up restriction against extreme exploitation, say Consular advices.

In some parts of Sweden the propriety rights of the owners of private forest have been limited by special laws and the forests in these districts have been well preserved, but on the whole the forests have been threatened by excessive felling. It is therefore hoped that the new law will fill the long-felt need. The farmers alone have criticized the measure basing their objection upon the regulations pertaining to the protection of young forests on the ground that these regulations will involve economic difficulties for the owners of small farms.

The new law may be characterized as a conservation and regrowth law. It makes ample provisions for adequate maintenance and scientific cultivation of the Swedish forests. Strict regulations are imposed with regard to felling of young timber and the care of old forests. Much attention is also given to the measures insuring regrowth, and special regulations have been made with regard to forests difficult to reproduce. The Swedish authorities are now keenly alive to the necessity of better care of the forests and with this in view the new law places considerable obligations upon private timber owners to exercise great care in their felling operations.

National Purchases on Ohio

The National Forest Reservation Commission, assigned the duty of purchase of land for National Forests, during December approved the purchase of 130,000 acres of land in Virginia, West Virginia and Pennsylvania, largely for the protection of the watersheds of the Ohio River tributaries. Under the proposed change in forestry practice suggested by the McNary forestry bill, such future purchases would not be limited to the watersheds of navigable streams, but the effect of such a bill if passed would not prevent the continued work of acquisition of lands in the White and Appalachian mountain regions.

Forestry and Engineering

That forestry involves engineering, and as such is truly a profession, was the statement of Dr. E. B. Claridge, of the University of New Brunswick before the St. John's branch of the Engineering Institute of Canada. He pointed out that forestry involves the art of growing timber as a crop, but that the forest engineer has a closely related field in the design and construction of works in the forest to bring its products to the mill. Mapping, forest fire fighting and other forest duties were explained as part of the work needed to make the forest a continuous producer of timber, and for an exhaustive process such as mining. The University, he said, trains its students on an 8,600 acre woodlot.

Paper Company Moves

The Hollingsworth & Vose Co., have announced their removal to the Province Building, 333 Washington Street, Boston, Mass., Rooms 804 to 815.

Readjustment Rates on Paper

The proposed substantial increase in classification of paper and paper bags on freight shipments in this section to Southern points has been withdrawn, it is announced by the traffic bureau of the Chamber of Commerce, H. P. Hanson, manager. The schedule was to have been made operative, Nov. 30 but was suspended by the Interstate Commerce Commission.

The cancellation of the plan was at the request of the railroads whose officials expressed a desire to make favorable adjustments informally. If the railroads and shippers are unable to arrive at an agreement the Interstate Commerce Commission will resume the proceedings and continue the case on formal complaint.

PRODUCTION DROPS 8 PER CENT

November Pulp and Paper Production Statistics Shows Lessening Among Those Reported

PRODUCTION of paper by identical mills reporting to the American Paper and Pulp Association and cooperating organizations showed a drop of about 8 per cent in November from the October production, according to the monthly statistical summary of the paper and pulp industry.

Estimates for the year, however, based on the eleven months figures which are available show that the total volume of production in 1923 will be above any previous year except the boom year of 1920.

The tonnage summary is prepared by the American Paper and Pulp Association with the cooperation of the Binders Board Manufacturers Association, Newsprint Service Bureau, Tissue Paper Manufacturers Association, Wrapping Paper Manufacturers Service Bureau and Writing Paper Manufacturers Association. The figures for November follow:

Grade	Number of Mills	Production Net Tons	Shipments Net Tons	Stocks on Hand, End of Month
Newsprint	66	119,720	117,176	24,040
Book	69	62,904	62,158	27,221
Paperboard	113	99,351	97,185	33,941
Wrapping	89	50,917	46,960	51,066
Bag	31	8,073	7,595	6,736
Fine	86	22,940	23,077	38,676
Tissue	45	9,703	9,622	7,999
Hanging	10	4,876	5,919	3,241
Felts	15	8,463	8,498	1,650
Other Grades	62	15,845	14,847	18,736
Total		302,792	293,037	213,306

The statistical table below gives the number of mills reporting to the American Paper and Pulp Association and the U. S. Pulp Producers Association, and the data as to production of the various grades of pulp.

Grade	Number of Mills	Production Net Tons	Shipments Net Tons	Stocks on Hand, End of Month
Ground Wood Pulp ..	101	77,773	6,089	41,506
Sulphite, News Grade .	40	41,802	4,029	15,529
Sulphite, Bleached	17	13,908	2,902	2,451
Sulphite, Easy Bleaching	5	4,742	444	983
Sulphite, Mitscherlich .	6	4,891	457	1,860
Sulphate Pulp	14	14,071	1,691	15,887
Soda Pulp	12	11,894	4,795	2,946
Other than Wood Pulp	2	84	78	134
Total All Grades		169,165	20,485	81,296

Good Year Expected by National City

The power of the United States to enjoy prosperity despite the unsettled conditions in Europe is considered as the outstanding achievement of 1923, according to the annual business review of the National City Bank.

"The record of 1923 can be repeated if the American people but have the courage to proceed with the development of their resources and the equipment of their industries," the report continued, "as they have done in the past year.

"There is no lack of work to be done. The chief occupation of the American people is that of supplying their own wants, but that their foreign trade is of a stable character the sustained exports of the last two years have shown. The balance between agriculture and the other industries is in the way of being restored, and if we will be satisfied with steady business, without a boom, there is good reason to expect that our hopes will be gratified in 1924."

In discussing the outlook of business the review said:

"No business crisis ever has occurred unless preceded by a marked expansion of credit, and none need be looked for until such an expansion has occurred. We are not free from danger of it; the continuing importations of gold should keep us on our guard. In 1923 they have been greater than in 1922, reaching approximately $300,000,000.

These additions to our gold stock are abnormal and undesirable, for if used in our reserves as the basis of credit they would produce inflation and if not so used they are unprofitable acquisitions. The bankers of Europe are confident that the expansion of credit is only a question of time, and that when the rise of prices comes the trade balance will turn heavily against us and that Europe will recover a good share of this gold. They thought these predictions were about to be realized last Spring, but the country was conservative and prices turned downward. So long as the tendencies to inflation can be held in check we may look for steady business."

CONVINCED PAPER CAN BE MADE OF STRAW

Pulp and Paper Men of Eastern Canada Assert That Newsprint Can Be Made From Straw

THAT paper can be produced from straw seems to be the view of several pulp and paper men in eastern Canada. Another to hold this view is Sir Frederick Becker, head of the recently defunct firms of Charles Marsden and Sons and Becker and Company, pulp and paper manufacturers and dealers in England. For the past few months investigations have been pursued by one of the leading Canadian pulp and paper manufacturing concerns, to ascertain if newsprint could be manufactured from straw. While he was in eastern Canada, Becker studied this question very minutely. The cost of pulpwood, added to which is the dearth of the pulpwood, in some sections and the high cost of cutting and shipping the wood, have been contributing factors in causing the investigations.

The scientific investigations have not been completed, but thus far a fair measure of success has been attained. Some of the pulp and paper men display little interest in the investigations as they believe that satisfactory results cannot be obtained. It is also likely that before long, one of the Canadian pulp and paper manufacturing plants will be producing paper from hardwood, following the lead of a company operating a mill in Massachusetts. There is plenty of hardwood available in eastern Canada. The feeling seems to prevail among the pulp and paper men in the eastern Canada territory that while producing paper from straw and from hardwood may be feasible, they are leaving the start of such manufacture to "the other fellow." Experiments may be made at the mills of the Clyde and Sissiboo Company.

Additional Factory Branches

Direct factory branches and warehouses have been established in San Francisco and in Los Angeles by the Chain Belt Company of Milwaukee, Wisconsin, manufacturers of Rex Chains, Transmission Machinery and Conveying equipment.

The San Francisco office is located at 82 Natoma Street with G. E. Taylor in charge as District Manager.

The Los Angeles branch is located at 210 South San Pedro Street, with J. V. McDonald as District Manager.

With these two direct factory branches, and the establishing just recently of similar branches and warehouse stocks in Spokane, Seattle and Portland, the Chain Belt Company are in a position to assure complete service on products of our manufacture to the Pacific Coast trade.

A Christmas Gift to Timberland

Dr. R. W. Corwin is chief surgeon at the Minnequa Hospital, Pueblo, Colorado. For the past five years on Christmas Day, Dr. Corwin has invited all the nurses, doctors and many citizens to the beautiful grounds surrounding the hospital and then he plants trees in various sections of his "lovely forest." There are 1,700 trees there now.

Speaking of the object, he says: "Why cut trees for Christmas, wasting and destroying timber. It would be better if every family in the United States would plant a tree on December 25 each year and then a young forest of 20,000,000 trees would be born. Add to this 20,000,000 or more uncut trees and reflect upon the continued annual economic benefit to the country and then these trees every day remind someone of Christmas."

Elected a Director

Wilbur F. Denious, receiver for the Meyer Pulp and Paper Mill of Denver, Colorado, was elected a director of the Civitan Club of the Mile-High city.

DEFENDS U. S. PAPER MEN ASSOCIATION

Ralph P. Bell Makes Strong Defense of Keeping Embargo From Wood Pulp

IN the press controversy over the proposed embargo on shipments of pulpwood to the United States, F. D. J. Barnjum is not having it all his own way. In a recent reply to him Ralph P. Bell of Halifax, N. S., says:

"As Canadians we are primarily concerned with the question of how such a measure will effect us, ourselves, but in a national sense we should be even more concerned as to how it will affect our neighbors from across the line, to whom we have in the past sold several million dollars' worth of timberlands with the full knowledge that it was their intention to ship to their mills in the United States and who have to date been permitted to do so without interference."

"I am sure that every fair-minded Canadian will agree that all such lands owned by Americans, or by companies the capital stock of which is controlled by Americans, title to which was acquired prior to the passing of the legislation of 1923, should be exempted from any action (if any) that the Government may decide to take, and that the Government should at once make a statement to this effect.

"If this point, about which there surely can be no honest difference of opinion, is cleared up, we can proceed to fight out the question as Canadians vs. Canadians, without the perpetual claptrap on the part of this particular correspondent about the gigantic campaign fund, the awful agitation, and the tremendous legal fees of the American interests.

"What is there, by the way, that is unusual in the American manufacturers having organized to protect their interests and hired three or four Canadian lawyers in the different provinces to represent them?"

Chance For a Paper Man

A thousand dollar award will be made to the scientist who presents the most notable contribution to the advancement of science at the seventy-fifth anniversary meeting of the American Association for the Advancement of Science to be held at Cincinnati, Dec. 27 to Jan. 2.

This prize has been offered by an anonymous member of the Association, who is understood to be a layman living in New York, and the recipient will be selected by a special committee to be appointed.

All of the 1200 to 1400 speakers at the meetings of the 42 sections and societies to meet with the American Association will be eligible for the prize.

New Paper Mill for Oregon

Announcement has been made at Portland, Ore., of the early erection of a paper manufactory in the North Portland industrial district. Backers of the project have incorporated as the Portland Pulp & Paper Company with a capitalization of $1,500,000. The incorporators are: Roy H. Mills of Portland, president; D. J. Fry and F. D. Thielsen, both of Salem. The plant will require an investment of $1,250,000 and will turn out 50 tons of paper a day.

It Pays To Advertise—But!

A lion met a tiger
  As they drank beside a pool.
Said the tiger, "Tell me why
  You're roaring like a fool."
"That's not foolish," said the lion,
  With a twinkle in his eyes.
"They call me king of all the beasts . . .
  Because I advertise!"
A rabbit heard them talking
  And ran home like a streak;
He thought he'd try the lion's plan,
  Bnt his roar was a squeak.
A fox came to investigate—
  Had luncheon in the woods,
So when you advertise, my friend,
  Be sure you've got the goods.

—*Baltimore Ad Club Bulletin.*

Samuel J. Lewis Dies

Samuel J. Lewis, state printer for Colorado, died in his Denver home on December 26. Mr. Lewis was born at Cleveland, Ohio, 49 years ago. He was a writer for many magazines and universally liked. He had been in ill health for a long time, general complications.

SHORT ENDS

In the recent controversy between the Hawley Pulp and Paper Company and the Oregon City Woolen Mills over the vacation of the stub of Third Street as per the request of the paper company, the city council of Oregon City, Oregon, passed an ordinance favorable to the Hawley Pulp and Paper Company. The new $1,200,000 plant, which is to replace the one recently destroyed by fire, will at once be put into construction.

After a shut-down since summer, due to recession of the waters of the Willamette the grinder mills at Oregon City, Oregon, resumed operations as the high water of the Willamette once more appeared. All machines are now in operation.

E. K. Stanton, head of the research department of the Crown-Willamette Paper Co., assisted by O. W. Mielke, of the Blake, McFall Co. recently demonstrated with lecture accompanied by motion pictures how paper is made to the Portland Advertising Club. Every phase of paper manufacture from the felling of the timber to the delivery of the completed newsprint to the daily papers was shown. Mr. Mielke announced that 180 tons of news print are used in Portland, Oregon, each month.

The next meeting of the Michigan Division of the Superintendents Association will be held at the Park-American Hotel Kalamazoo, Michigan, on December 20th. At this meeting, Mr. R. H. Whitney, manager of the Detroit Branch of the B. F. Goodrich Rubber Co., will give a talk on soft rubber press rolls.

The Mead Pulp & Paper Company wishes to correct a misstatement in Mead Cooperation for December to the effect that A. L. Rieger died several years ago. Mr. Rieger, though seriously ill at one time, is now in the best of health and is actively engaged in the management of the Peerless Paper Company.

The office and main warehouse of the Letellier-Phillips Paper Co., 623 S. Front St., New Orleans, La., has been damaged by fire to the extent of $50,000.

The Economy Match Box Co., has been incorporated in Dallas, Tex., with a capital stock of $10,000 by W. W. Sands, O. I. Cox and others.

The Natchez Printing & Stationery Co., Natchez, Miss., plans erection of an addition to its building.

Getting Mixed

"What noise is that you're making down there?"

"Ish either night falling or day breaking! Donno which, m'dear."

Slight Exception

The Automobile always beats the train to the crossing, barring accidents.—*Detroit News.*

No Fun

A woman came into a car with five children. She busied herself seating them. A benevolent old gentleman arose and gave her his seat.

"Are those all your children, madam," he asked, "or is it a picnic?"

"They're all mine," snapped the woman, "and it's no picnic." —*Parakeet.*

The Logic of the Case

Free State Patrol—"Have ye yer permit on ye for dhriven. the cyar?"

Motorist—"I have that. Are ye wantin' to see ut?"

Free State Patrol—"What for would I be wantin to see ut if ye have ut? It's if we had ut not that I'd want to look at ut."—*Punch* (London).

Why the Joneses Bought the Car They Did

Because the salesman:
Laughed at Mr. Jones' jokes.
Told Mrs. Jones she couldn't have a daughter that old.
Told Susie she looked like Mary Pickford.
Told Willie Jones he had a build like Dempsey.
Said the Jones baby took after both parents.
And only smiled when the Jones' pup nipped him.

Gardner & Harvey Company Formed

On December 20 a new company was incorporated, to be known as "The Gardner & Harvey Co." This new company took over on January 1 all of the assets and liabilities and property of The Colin Gardner Paper Co., The Gardner-Harvey Paper Co., The Gardner Paper Board Co., The Universal Paper Products Co., and the (old) Gardner & Harvey Co.

These companies above named dissolved and the new company started operations on January 1. In other words, this is a consolidation of these old companies into one new company known as The Gardner & Harvey Co., which will have 20,000 shares non par Common stock and $300,000.00 Preferred stock par value $100.00.

The Universal Paper Products Co. was formerly a Folding Box Dept. and these other mills were run as separate corporations. They will now be under one head, and one company known as The Gardner & Harvey Co., and the officers and directors are as follows: E. T. Gardner, President; Colin Gardner, Vice-President; M. S. Johnston, Secretary; R. B. Gardner, Treasurer, together with the following Directors: George H. Harvey, Tom Harvey, Arthur R. Harvey, J. J. Hain, J. C. Leach, W. H. Swan, Earl H. Turner.

This business will be conducted along the same lines as these separate companies have done in the past, and will continue the manufacture of box board and folding boxes.

Firm In New Incorporation

Z. & W. M. Crane, Inc., Dalton, Mass., has just been incorporated with a capital of $2,000,000. The incorporators are William G. O'Connell, Dalton, Mass., Theodore Pomeroy, Dalton, Mass., and James F. Bacon of Boston. The new corporation takes over the mills which for so long have been in the family of the late W. Murray Crane, former governor of Massachusetts and United States senator. The mills manufacture high grade writing papers.

Prominent Pulp Man Dies

George E. Henry, prominent pulp and paper manufacturer of New Hampshire, died January 2 at his home, 407 Highland Avenue, Winchester, Mass. He was born in West Littleton, N. H., March 24, 1862, the son of James E. and Eliza Ide Henry and after his schooling in Woodsville, N. H., he entered the firm of Henry, Joy & Baldwin, of which his father was the head. Eventually he succeeded to the business and operated pulp and paper mills in several sections of New Hampshire. He had made his residence in Winchester, Mass., for the past few years. He is survived by a wife and a son, James E. Henry. After services in Winchester, the remains were taken to Littleton, N. H., where additional services were held and interment took place.

Heavy Losses By Fire

The John Martin Paper Company, Limited, were heavy losers by fire which destroyed the five-story building of Tees and Pearse, Limited, in Winnipeg a few days ago. The company, which is one of the largest jobbing concerns in Canada, suffered complete loss of their paper stock amounting in value to something like $400,000, although the loss was completely covered by insurance. A number of the paper mills in Canada came to the rescue of the concern and almost before the fire was extinguished stocks of paper were on the way to Winnipeg with the result that the company was able to carry on business in other premises at once.. Tees and Pearse, Limited, who were manufacturers agents, represented the E. B. Eddy Company, Limited, paper and matches.

Foundations for Warehouse

Foundations are being laid for a warehouse for the Judd Paper Company, 166 Race Street, Holyoke, Mass., and George P. B. Alderman & Co., of Holyoke, have the contract. The building will be of brick, mill construction, three stories and basement and will be 90 x 100 feet. It will cost approximately $100,000.

Paper and Board

New York, January 8.—With the inventory period past and with members of the trade over their holiday celebrations, the paper market is beginning to show more normal characteristics. Demand for most kinds of paper continues limited. There is a good movement on contracts and also against orders placed some time ago for forward shipments but transient demand for book, writing, wrapping, tissue and other descriptions of paper is none too lively; as a matter of fact, it is quiet, as consumers have not yet resumed buying on anything approaching usual volume in busier periods of the year.

Newsprint demand and consumption are holding up to a high level. Publishers of newspapers are enjoying probably the most prosperous era in the history of journalism, and are literally deluged with advertisments, so that big issues are being printed to carry all of the advertising that large and small advertisers are placing today. Not in a long time has a year started promising so much in the way of voluminous business for the newsprint manufacturing industry as the year which has just been ushered in. Publishers in various parts of the country have been arranging contracts during the past few days which, it is said, will absorb almost the entire production of print paper mills for the next several months. There has been no hesitancy about contracting for newsprint. The price prevailing is satisfactory to publishers, who have had one thought uppermost in their minds and that is to cover their major requirements for the first few months of the year.

Print paper prices are firm and there is a strong tone noted, but there is not likely to be any change in quotations for the first half of the year. At least, the more important manufacturers have announced they will maintain present prices during the first six months of 1924; what will happen after that is merely a subject for conjecture at the moment. Statistics concerning last year's production of newsprint in the United States and Canada will soon be available and it is a foregone conclusion they will show a new high record of output was reached in 1923. What is more, present indications are that this year will witness the breaking of last year's record of production unless some drastic developments occure which would severely affect the consumption of print paper.

The market for book paper is unmistakably easy. Manufacturers are vying for business and they are granting prices concessions in their competition to secure as many orders as they can. Demand is merely of routine nature though it is stated that some book paper mills are well fixed with contract business. Reports have it that machine finished book paper of at least a certain quality has sold in New York at less than six cents per pound f. o. b. this city. It is said that manufacturers as a rule are quoting around 6.50 cents per pound New York for the average grade of machine finished book, but quotations mean little when the market is weak and producers are seeking business. Super book paper is quoted at around 6.50 cents, or at a range of 6.25 to 6.75 cents f. o. b. New York, while coated book paper is quoted at 8 cents a pound upward New York.

Wrapping paper also is in a quiet and easy market position, and prices are tending downward. About 6 cents f. o. b. New York is the minimum price most mills will entertain but there are some who are apparently shading this figure for No. 1 domestic kraft wrapping. Tissues are in routine demand only but unchange in price, While fine papers are moving along showing little market development of note and no worthwhile fluctuation in price. Bag paper continues to move freely, and there is a steady demand for building papers and for glassine paper.

Box boards are quiet. Consumers are passing through their in-between season at present and are purchasing board merely in a small way to cover immediate needs. Nevertheless board quotations evince considerable steadiness, and mills in the East continue to quote $47.50 a ton f.o.b. New York for plain chip and $52.50 per ton for news board. Some of the specialty grades of box board are being absorbed in fair amounts.

Mechanical Pulp

Demand for mechanical pulp is somewhat slow in developing but there is a sufficient movement into consuming channels to fully sustain market prices, particularly since a majority of producers have no large tonnage to direct to the open market. Members of the trade aver that prices of ground wood are likely to strengthen as the winter proceeds and colder weather is encountered by grinders, and there is consequently little or no pressure to make sales and producers are holding to their former quotations. Domestic mechanical pulp is bringing around $40 a ton f. o. b. pulp mills, while imported ground wood is selling at $38 a ton thereabouts ex dock New York.

Foreign and Domestic Chemical Pulp

The market for chemical pulp continues in a more or less waiting condition. Those on the selling side express the belief that prices will stiffen in the near future or when paper manufacturers come into the market to resume purchasing on a nearer normal scale, and since primary markets abroad and in this country tend to exhibit increased steadiness, there is less resorting to pressure to effect sales. Reports state that the Baltic has frozen over for the winter, and this means that shipments from Sweden will automaically drop off, while late advices add that producers elsewhere in Europe haven't normal stocks of pulp to offer to Ameircan buyers. Moreover, demand from consuming quarters is due to expand in the near future; that is if the market runs true to form, as paper manufacturers usually are in more evidence as buyers along about February or March. All of these factors tend to steady the market and to stiffen values although

APPLETON WIRE WORKS

Durability and Elegance

To compel attention and stand out from the masses your direct-mail matter should carry an air of distinction. The selection of the proper paper is a mighty important factor in obtaining this result.

FRANKFOLD Enamel

helps give your message the first call and preference over others because FRANKFOLD ENAMEL is made purposely to withstand vigorous use without showing the unsightly cracks so common among most Enamel papers.

The uniform, smoothly coated surface of FRANKFOLD ENAMEL helps your printer to obtain unusual results, either in black or multi-color.

We will gladly forward some printed specimens or blank sheets for dummy purposes.

THE FRANKLIN COATED PAPER COMPANY
Franklin, Ohio
Eastern Sales Office:
110 E. 42nd Street New York City

no actual changes in quoted prices are yet noted. Quotations ex dock New York and f. o. b. pulp mills are:

Unbleached No. 1	2.70 @ 2.90		
Unbleached news grade	2.50 @ 2.70		

Domestic Rags

Rag stock is very firm in tone and prices of most grades are decidedly on the move upward. It would appear as if strength in the low grades is so pronounced that the effect is being felt in the higher qualities, and all kinds of papermaking rags are tending to advance. Roofing stock has again strengthened in price. Sales of No. 1 packing at 1.90 cents f. o. b. New York have been reported, while No. 2 roofing has brought 1.60 cents a pound New York; in fact, unconfirmed reports allege that even higher prices than these have been granted by paper mills. New cuttings are firm and under fairly active inquiry though it is apparent a good deal of the demand is emanating from sources other than paper mills. No. 1 white shirt cuttings are quoted at 13.50 cents a pound f. o. b. New York, blue overall cuttings at 8.75 cents, and washables at 5.50 cents. Old white rags are steady, as are thirds and blues. Black cotton stockings have advanced to where dealers ask 4 cents a pound f. o. b. New York. Quotations on a f. o. b. New York basis follow:

New Shirt Cuttings,		Overall Cuttings, Blue	8.75 @ 9.00
No. 1	13.50 @ 14.00	Washables	5.25 @ 5.50
No. 2	6.00 @ 6.25	New Black Mixed .	5.00 @ 5.25
Fancy Shirt Cuttings	6.25 @ 6.50	Soiled Whites, house	2.90 @ 3.15
No. 1 Whites, repacked	7.00 @ 8.00	Soiled Whites, street	2.75 @ 2.90
No. 2 Whites, repacked	4.25 @ 4.50	Thirds & Blues, repacked	2.85 @ 3.00
White Lawns	11.25 @ 11.50	Thirds & Blues, misc.	2.40 @ 2.60
New Muslins, unbleached	11.50 @ 11.75	Black Cotton Stockings	3.75 @ 4.00
Light Silesias	8.25 @ 8.50	Roofing Rags, No. 1	1.90 @ 2.00
Black Silesias	5.50 @ 5.75	Roofing Rags, No. 2	1.60 @ 1.70

Imported Rags

Low qualities suitable for roofing paper manufacture are in better demand than other grades of foreign rags and yet most of the other descriptions are moving freely also. Prices exhibit much firmness and in some cases are gradually rising. Dark colored cottons have brought as high as 1.80 cents a pound ex dock New York. Quotations ex dock New York are:

Lins., White, No. 1	12.00 @ 13.00	German Linen, blue	4.00 @ 4.50
Ger. Blue Cottons..	2.50 @ 2.75	German Linen, grey	6.00 @ 6.50
French Light Blues	2.75 @ 3.00	German S P F.'s.	6.00 @ 9.00
New Light Prints..	5.50 @ 5.75	German Light Prints	3.00 @ 3.25
New Unbleached ..	9.50 @ 9.75	Dk. Colored Cottons	1.70 @ 1.80

Bagging, Rope, Etc.

Prices of old rope and bagging are holding, with no definite trend in either direction with the exception of some grades of scrap bagging which are tending upward. Domestic manila rope of No. 1 quality is bringing about 6.50 cents a pound f. o. b. dealers' shipping points, while foreign manila rope is quoted at 6 cents on the dock at New York. Roofing bagging is selling at 90 cents to $1 a hundred pounds New York, and No. 1 scrap bagging at 1.25 to 1.50 cents a pound, depending on the quality of packing. Prices t. o. b. New York follow:—

Gunny, No. 1	1.30 @	1.40	Wool Tares, heavy .	1.40 @	1.60
Foreign	1.20 @	1.30	For. Manila Rope ..	6.00 @	6.25
Wool Tares, light ..	1.20 @	1.40	Domestic Rope	6.50 @	6.75
Scrap Bagg., No 1.	1.25 @	1.50	Mixed Strings	1.00 @	1.25
Roofing Bagging ..	.90 @	1.00			

Old Paper

With several exceptions, prices of waste paper are easy. There are certain grades which are apparently in limited supply, and prices of these are firm, but bulky grades are gradually tending lower and consumers seem to be having no difficulty filling their wants at the prices they bid. Old folded newspapers are fetching 80 cents a hundred pounds f. o. b. New York, and No. 1 mixed papers 60 cents. Flat magazines have been bought at as low as 1.50 cents per pound New York though dealers generally hold out for higher prices, especially where good quality packing is involved. Shavings are noticeably neglected by buyers. No. 1 hard white shavings are available at 3.85 cents a pound f. o. b. New York, and No. 1 soft white at 3 to 3.25 cents. A firm item is white blank news cuttings, which are bringing 2.25 to 2.35 cents a pound New York. Old kraft paper also is firm at around 2.10 cents per pound at shipping points. F. o. b. New York quotations are as follows:

No. 1 Hard White Shavings	3.80 @	4.00	No. 1 Colored Shavings	1.60 @	1.75
No. 2 Hard White Shavings	3.25 @	3.50	Magazine flat stock.	1.50 @	1.65
No.1 Soft White Shavings	3.00 @	3.25	No. 1 Crumpled ...	1.25 @	1.35
Box Board Chips ..	.65 @	.70	Solid Ledger Books	2.15 @	2.25
			Ledger Stock	1.90 @	2.10
			Kraft No. 1	2.00 @	2.15
New Manila Cuttings	3.00 @	2.25	News, strictly overissue	1.10 @	1.15
Manila Env. Cuttings	2.75 @	3.00	Folded News	.80 @	.85
Bogus and Mill Wrappers	.85 @	.95	No. 1 Mixed Papers	.60 @	.65
			White Blank News.	2.25 @	2.35
			Common Paper	.40 @	.45

Twines

Seasonal quietness is noted in the twine market following a fairly active pre-holiday period. Consumers are now buying merely to satisfy urgent requirements and most sales involve small lots. Prices are firm, and an important factor in this connection is the pronounced strength in raw material, nearly all kinds of fibres being on the uptrend in price. Quotations are:

Sisal Hay, pure ..	12.25 @	13.25	Jute Wrapping twine, A grade	19.00 @	
Manila Hay, pure	16.25 @	17.25	Papermakers Twine	10.50 @	
Sisal Lath Yarn..	11.25 @	12.25	B. C. Hemp, 18 ..	.39 @	.40
Manila Rope, pure, ¾ inch diameter	14.25 @	15.25	B. C. Hemp, 24 ..	.38 @	.39
Hardware Rope ..	11.25 @	12.25	B. C. Hemp, 36 ..	.37 @	.38
Jute rope, ¼ diam. and over, coils..	12.00 @	14.00	American Light India— No. 6	14.50 @	
Sail twine, A grade	19.00 @		No. 7	13.50 @	

Chemicals

No changes of note are reported in papermaking chemical prices. Casein is quoted at a range of 13 to 15 cents a pound, duty paid on the foreign product, while bleaching powder is quoted at about 1.25 cents a pound. Caustic soda is holding at 3 to 3.25 cents per pound f. o. b. works, and soda ash is selling at 1.40 to 1.50 cents a pound on a flat basis.
